**Miltonia.**—This family of Orchids comprises plants which produce flowers at various periods of the year and they are deserving of extended culture. *M. vexillaria*, *M. Bleuana*, *M. Venus* and other hybrids are growing freely; having filled their receptacles with roots since being repotted last autumn, the plants will require more water than hitherto. They will increase in strength rapidly as the days lengthen. Thrips are very partial to the young, tender leaves of these Orchids, especially when the latter are grown in a warm, dry atmosphere; once they become established on the plants it is most difficult to eradicate them. Fumigating at intervals is the safest and surest means of destroying thrips, or dipping the plants at intervals in a weak solution of Quassia extract may be adopted. These plants often throw up their leaves closely folded together, especially the weaker growers, and unless the foliage is released it will be permanently injured.

**Repotting.**—Those plants which produced their flowers during the autumn, too late to be repotted at that season, may receive attention when their growths have attained sufficient size, and are about to develop new roots. They will succeed in a compost of equal parts *Osmunda* fibre, peat and A.I. fibre, with some *Sphagnum*-moss and leaves added. These plants delight in an even temperature the whole year round and should be grown in a cool house during the hottest part of the year, and in an intermediate house during the coldest months.

**Treatment of Newly-potted Plants.**—After repotting any plant watering should be done with extreme care, as most plants form roots quickly in a moderately dry compost. An excess of water not only decays the potting material but there is a danger of the new growths and the new roots decaying as well.

### THE KITCHEN GARDEN.

By R. H. CROOKFORD, Gardener to THE RT. HON. LORD  
WAVERLEY, Horsley Hall, Oxford, N. Wales.

**Spinach.**—Sowings of the round or summer varieties of this vegetable should be made at intervals and throughout the season to suit the requirements of the establishment. Well-manured ground is necessary, if fine leaves are to be expected. A position such as between the rows of early Peas suits this crop admirably. The seeds should be sown thinly and the seedlings thinned freely allowing a space of quite eight inches between them. When they are growing freely, old soot dusted lightly along the row forms a useful stimulant. Other forms of Spinach, such as the Prickly or Winter Spinach as well as the Perpetual or Spinach Beet, will now be greatly benefited if a dressing of the same fertiliser, or a very light sprinkling of sulphate of ammonia is given between the rows, after which the frequent use of the Dutch hoe to keep the soil well-stirred will do much to promote active growth.

**Spring Cabbage.**—The above remarks as to dressing and hoeing Spinach applies equally to this crop. Should there be any gaps in the rows the blanks should now be filled with plants from the reserve bed.

**Seakale.**—Suitable strong crowns or clumps of this useful vegetable not yet covered should now have pots, boxes, or the like, placed over them, and covered with sufficient leaves or litter to exclude all light, total darkness being absolutely essential to obtain perfectly-bleached heads. Should pots, etc., not be available, good results may be obtained by covering the crowns with ashes or sand to the depth required.

**Onions.**—In gardens where the Onion maggot is troublesome it is wise to sow Onion seeds now in boxes, under glass. They should be sown thinly. The seedlings should be grown very sturdily and be well-hardened by about the end of April, at which time they may be planted in their permanent positions. When treated in this way, and the young plants kept lightly dusted with soot (thereby making them distasteful to the fly), the attack will be greatly minimised.

**Brussel Sprouts and Cauliflowers.**—For early supplies, seeds of these Brassicas should be sown now in boxes or frames. So soon as the seedlings show a pair of rough leaves, prick them out, either into other boxes or frames, and grow them sturdily until planting-out time arrives.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brockstall Hall, Hertfordshire.

**Humea elegans.**—These plants should be kept growing actively in a cool house as near to the roof-glass as possible on a cool bed of ashes. When the pots become well-filled with roots the plants may be transferred to their flowering pots, which may be from six inches to eight inches in diameter. After potting them they should be watered carefully at all times. The compost may consist of three-parts fibrous loam and one-part leaf-mould, mixed with broken charcoal and coarse sand to allow a free passage for water. Humeas require cool treatment at all seasons, and no attempt should be made to hasten the plant by forcing, as this would only end in failure.

**Salvia splendens.**—Old plants of this *Salvia* that were cut back after flowering to produce stock for this season should now be furnished with plenty of strong, healthy growths suitable for use as cuttings. These may now be taken off and inserted in light, sandy soil, placing four or five cuttings around the side of a sixty-sized pot. They will root readily if placed in a propagating frame; failing this they may be stood in a box, covering the same with a sheet of glass. When sufficiently rooted they should be placed near the roof-glass in a house having a moderately warm temperature until they are ready for placing in large sixty-sized pots. The compost for this potting should consist of loam, leaf-mould and sand. This *Salvia* is subject to attacks of red spider and white fly; the former pest may be kept in check by syringing the plants with tepid water, and the latter by cyanogas used strictly according to the directions of the makers.

**Ferns.**—Plants of *Adiantum cuneatum* that have been used for decorative purposes and have been given a slight rest will now be ready to start into active growth again. For this purpose they will need to be grown in receptacles of various sizes ranging from small sixties to thirty-two's; therefore it becomes necessary to divide the plants by cutting them into portions to suit the various sized receptacles in which they are to be grown. The compost should consist of a mixture of good loam, peat, silver-sand, and broken charcoal. After potting the plants stand them in a house having a brisk temperature and plenty of atmospheric moisture.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Gooseberries and Currants.**—To maintain a stock of healthy, young plants in readiness to take the place of old bushes or to form new plantations, a quantity of cuttings should be prepared and rooted annually to meet the requirements. In the cases of Gooseberries, Red Currants and White Currants, I prefer a clear stem of nine to twelve inches from the ground-level to the lower branches, and to attain this the lower buds should be removed when preparing the cuttings. The latter should be planted firmly in a suitable position in rows twelve inches apart to enable a small hoe to be used when required to keep down weeds and make the surface friable.

**New Plantations.**—Select a good position for new beds of bush fruits. The land should be dug deeply and manured, especially if the soil is light and porous. Set out the plants at six feet apart and apply a shallow mulch later if required.

**Pruning.**—If the pruning of the fruiting bushes has been deferred the work should be completed forthwith. To obtain large fruits for dessert the roots should be top-dressed and mulched liberally with suitable manure. The heads of the bushes should also be well-thinned and measures taken to prevent birds damaging the buds. A few strands of black cotton strung over the bushes at different heights will do much to keep the birds away.

**Nuts.**—The pruning of Nut bushes may now be done, as the small, pink-coloured female blossoms are fast opening. The pruning of full-sized bushes at this date consists principally in thinning some of the twiggy growths where they are too numerous, cutting them back to a few buds and removing entirely very gross shoots. Endeavour to keep the main, cordon-like branches well-furnished from bottom to top with healthy, fruiting growths. Leave plenty of male catkins suitably placed to ensure fertilisation of the female flowers. All suckers should be grubbed up and strong growths around the main stems removed. Top-dress the roots with suitable feeding materials, if needed.

**Vines.**—Established vines growing on walls or fences should be pruned and put in order before the sap begins to move. After this date and especially if the wood is not well-matured, the cut surfaces should be dressed with Thompson's vine styptic to prevent bleeding. Dress the rods with a mixture of Gishurst compound and make sure that all the fastenings are perfect to hold the rods in position in stormy weather. Give the roots a liberal top-dressing of rich soil and manure where this can be done conveniently, but this will not be necessary in the case of vines that are growing very strongly.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Vine Eyes.**—Eyes inserted in small pots or squares of turf last month should be rooted in a steady bottom-heat of 75° to 80°, and a close, humid atmosphere, but on no account should the soil be made wet before the roots reach the sides of the pots. When they have done this and a few leaves have been made the more forward eyes may be shifted into pots two sizes larger. The compost should be warm and on the dry side; it should be composed of good, turfy loam, a little lime rubble and bone-meal. After potting them return the young vines to steady bottom-heat until such time as they are ready for transferring to seven-inch pots, which are large enough for planting canes.

**Late Grapes.**—These are now grown to such perfection and kept so well after they are ripe as to considerably diminish the necessity for very early forcing. This practice results in a saving in fuel and the vines are not weakened by the hard forcing. The cultivator who moves with the times starts his early vines later and his late ones earlier, bringing their seasons of growth into a more genial time of the year, as perfection can only be obtained with some late varieties by making an early start. By this means the generally inferior Gros Colmar is altered in character and becomes eatable as well as saleable. Berries deficient in colour are generally inferior in flavour, and no Grape confirms the opinion that improved flavour accompanies good colour, better than this variety. The variety Lady Downes also requires a long season of growth to produce bunches of the best quality and develop the rich flavour it is noted for. All late Grapes are improved in quality by starting the vines at this date, with the possible exception of such varieties as Alicante, Gros Maroc and Alnwick Seedling. The advantages of starting the vines early are apparent

in dull summers, and the best time to use fire-heat is at the commencement of the season, when little suffices to start the vines into growth; no harm will follow a hot summer, as artificial warmth may then almost be dispensed with. Attend to the cleaning and top-dressing of the borders, if not already done, and water the borders copiously, as vines that are dry at the roots generally fail to break into growth satisfactorily.

### THE FLOWER GARDEN.

By JOHN COURT, Assistant Curator, Royal Botanic Gardens, Kew.

**Phillyreas.**—These shrubs are such attractive and useful evergreens it is surprising that they are not more generally used in gardens. They are quite hardy in the south, although in the north they may require sheltered positions. In the south and west *P. angustifolia* and *P. latifolia* make small trees. They are of such neat and close growth that it is surprising they have not been used for ornamental hedges. There are several varieties of both *P. latifolia* and *P. angustifolia*. *P. decora* (syn. *Vilmoriniana*) has much larger leaves than the others, and is more generally seen in gardens, as it is considered to be the hardiest species.

**Roses.**—Firm planting is essential in the case of Roses, and where the beds have not been prepared in advance for late planting it is a good plan to tread the bottom spit; that is, assuming the soil has been dug at least two spits deep. This method of treading the bottom spit will give, in newly-worked ground, a much firmer planting-medium.

**Montbretias.**—In most soils Montbretias increase so fast that they require to be lifted and divided every few years, and this is best done when they are just starting into fresh growth. The time for planting will, of course, vary in different parts of the country, but any time during February or the beginning of March may be regarded as suitable. For ordinary purposes it is sufficient to divide the clumps into pieces with from six to twelve young growths. If, however, the best results are to be obtained, a somewhat different procedure must be adopted, and, in fact, the method by which all the new and choice varieties should be increased. For this purpose the plants should have been lifted, placed in boxes, and wintered in cold frames; treating newly-purchased, dry corms in the same way. During February and March, when they have made about four inches of growth, the rooted stolons should be detached and placed singly in sixty-sized pots. They should then be grown on in cold frames, hardening them off in due course for planting out, about six inches apart, in well-prepared beds or borders, about the beginning of May. By this method the old corms are not used for planting, only the young stolons, and very fine results are obtained. Where large quantities are required, it answers almost as well if the stolons are planted about three inches apart in deep seed-boxes. Treated in this way, Montbretias are excellent subjects for summer bedding.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Bedding Pelargoniums.**—Autumn-rooted plants of bedding Pelargoniums, known popularly as Geraniums, should now be placed singly in three-inch pots and grown on in a moderate temperature; old plants that have been wintered safely will provide a plentiful supply of cuttings, which should be inserted this month in order to make up any deficiency or to provide dwarfier plants at bedding-out time. Three or more cuttings placed around the edge of a four-inch pot filled with a light, sandy compost will very soon form roots in a warm propagating house, when they should be potted singly before removing them to cooler quarters. For some obscure reason, that has never been satisfactorily explained, cuttings of Pelargoniums inserted at this season are not so liable to damp off as those rooted in autumn,

and the recommendation usually given of laying these cuttings out to dry for a day or two, a practice usually adopted with autumn cuttings, is unnecessary; they may be inserted forthwith and watered in, when the majority will root in a very short time.

**Lime-Sulphur Spraying.**—The present is a most suitable time for spraying fruit trees in order to control fungous diseases, and lime-sulphur is admirably adapted for the purpose. Where brown rot, scab and canker are prevalent, the spraying should be performed carefully at the winter strength recommended by the makers, and if a second spraying is necessary, this may be done in a fortnight's time, and the specific diluted. The spray should not be used at the winter strength when the buds are active, but by diluting the lime-sulphur to summer strength, spraying may be done with safety, even when the trees are in full foliage. The disfiguring blotch or disease which attacks Peach trees growing on outside walls may be reduced

### BULB GARDEN.

#### TWO GOOD DAFFODILS FOR FORCING.

THE early-flowering qualities of King Alfred and Sir Francis Drake Daffodils are by no means common knowledge, but the fact is that they are two of the very best sorts for gentle forcing. A trial has proved that of the two Sir Francis Drake is slightly the earlier.

Bulbs of both varieties were potted on August 12, in turfy, yellow loam, placed out-of-doors and covered with four inches of ashes. Here they remained until the first week in November, when they were taken out of the ashes and placed in cold frames. On December 8 they were taken into a house having a temperature of 50°, which at the end of the month was raised to 55° to 58°. The foliage developed very strongly, the stems were robust, and on January 16 the first flowers of Sir F. Drake were fully expanded, while those of King Alfred were not developed until January 20.

FIG. 62.—COLCHICUM CROATICUM.

R.H.S. Award of Merit, February 8. Flowers white. Shown by Mrs. Dykes, Sutton Green, Woking. (see p. 120).

if not eradicated altogether, by spraying them twice about this season each year, before the buds have started, and the more general use of this spray would be a great benefit to all fruit growers.

**Re-potting Stove Plants.**—The various plants in the stove house should be given attention, repotting all plants which require it, and discarding those which, by reason of age, are no longer attractive. Cuttings of *Codiaeums*, *Dracaenas*, etc., should be inserted singly in pots and plunged in a brisk bottom-heat, always making sure that adequate supplies of moisture are supplied. Palms, such as *Kentias*, do not need repotting so often as many other plants, if regularly supplied with liquid manure, but when the pots are no longer able to accommodate the roots they should be shifted into a larger sized receptacle. A mixture of good fibrous turf, peat, leaf-soil and sand forms a suitable compost for most of the occupants of the stove, and where Sphagnum-moss is available this may be used with great advantage to cover the crocks, instead of rough leaves or turf, which are usually employed.

Both varieties were moved into a cool house, and a most brilliant show has resulted. The colour in both cases was perfect, the deep rich yellow of King Alfred being as good as it is when the plants are grown outside.

No manure, either in the soil, or water, was given these plants, which were grown in seven-inch pots. J. S. D.

#### CROCUS LAEVIGATUS.

*Crocus laevigatus* has been flowering in the open since well before Christmas, and even during the second week in January it was still making a pretty show, and looked like continuing in bloom for some time.

It is a variable plant in nature, the flowers ranging from white to pale lilac and feathered with markings of a crimson-purple tint.

The flower grows about two-and-a-half inches high and is three-quarters-of-an-inch in diameter. It is of good substance and is capable of withstanding bad weather better than most members of the genus.

*Crocus laevigatus* is a delightful subject for a sheltered corner of the rockery. T. H. Everett.

## GALTONIA CANDICANS.

AMONG the many good garden plants which have been introduced from South Africa, few, if any, are more generally useful than this bulbous subject. The flowering period extends from June to August, and the flower-spike, which attains a height of three to four feet, bears from twenty to thirty pure white, pendulous, bell-shaped flowers, each about one-and-a-half inch long, and delightfully fragrant.

*Galtonia candicans* is seen at its best either when planted in a large, isolated group, or when associated with some imposing foliage of a different character, such as that of *Yuccas*. A clipped Yew hedge also makes an excellent background for a planting of this subject.

A rather light but rich soil gives the best results, and the bulbs may be planted any time from November to March. A layer of sand should be placed under the bulbs, which should be set eight inches apart at a depth of four inches.

Once planted, they need not be disturbed for many years as the best results are obtained from established clumps. A mulch of light material applied in the autumn will protect the plants from severe frost.

So soon as the flower-spikes have faded they should be cut away to allow all the energies of the plant to be concentrated on strengthening the bulb to provide for a future display. Offsets afford a ready means of propagation. *T. H. Everett.*

## ALPINE GARDEN.

## CERASTIUM ALPINUM LANATUM.

*CERASTIUM tomentosum*, or "Snow-in-Summer," is abundant in many gardens, but few know *Cerastium alpinum lanatum*, a distinct form of a native plant not commonly seen, unless in its native habitats. This alpine *Cerastium* is very "fluffy," with silvery down, but the form *lanatum* possesses this feature in such a marked degree that it has been likened by Mr. Clarence Elliott to chinchilla fur, and he calls this form the "Chinchilla Plant."

The plant grows just a little above the soil and should be exposed fully to the sun. It does best in a moraine containing lime or in very light, dry, stony, sandy soil in the rock garden. Winter wet is its greatest enemy, and in wet districts a sheet of glass should be arranged as a protection overhead from October until March. *S. Arnott.*

## HARDY FLOWER BORDER.

## CAMPANULA GLOMERATA.

*CAMPANULA glomerata* is one of the best known of the cluster-headed Bellflowers. It is a native of England and perfectly hardy, presenting few difficulties as a border plant. It grows about eighteen inches high, and has fine, clustered heads of blue flowers.

A delightful variety is *C. g. acaulis*, which is attractive in the rock garden, as well as in the front of the hardy flower border. *C. g. alba* is a variety with good white flowers and appreciated by many. *C. g. dahurica* is one of our best hardy flowers, and is universally appreciated. It has very large heads composed of deep purple flowers. There is also a white variety of *C. g. dahurica* which appeals to many, although it has not the grand effect of *C. dahurica* itself. Another variety of *C. glomerata* bears the title of Mauve Queen. It has flowers of a delicate mauve or pale blue. A double variety, called *C. glomerata plena*, is also in cultivation. It has blue flowers, and admirers of double varieties of border flowers prize it.

All these *Campanulas* flower in June or July and last for a long time in bloom. They are increased by division, and grow in any good garden soil. The type may be raised from seeds. *S. Arnott.*

## FLORISTS' FLOWERS.

## THE DOUBLE WALLFLOWER.

THE double Wallflower has been cultivated for nearly four hundred years in this country, and for a very long period it enjoyed considerable popularity as a florists' flower; the varieties long in cultivation were the blood-red, black, golden yellow and pale yellow, and in old books it is not uncommon to find mention of one with nearly green flowers.

This fine old flower was popular in the north of England, and it was not unusual for plants exhibited to bear spikes from eighteen to twenty-four inches long.

As the plants pass out of flower they produce an abundance of shoots, and from such, removed in their entirety, particularly good varieties were perpetuated; the procedure followed by the old florists was to select shoots from two to three inches long, which had become a little firm at the base and to insert them in a frame or under hand-glasses, a firm, loamy soil being favoured for these cuttings.

When rooted, the cuttings were either planted in their permanent flowering quarters or placed

Although not comparable with the single flowered Wallflowers for bedding purposes, or for general garden display, they are very fine as pot plants, and individually possess much beauty, perfection of form and delicious fragrance. *Ralph E. Arnold.*

## FLOWER GARDEN.

## VERBENA VENOSA.

MR. W. ROWLE's praise of *Verbena venosa* (p. 96) is another testimony to the pleasure this old-fashioned favourite gives in gardens. Here, we grow it in large clumps in the herbaceous borders, and it is most effective.

The treatment consists in keeping it within bounds, lifting the plants about every third or fourth season, and replenishing the site with leaf-mould or manure. The plant is sufficiently hardy to withstand the winter here—but my remarks are prompted by the remembrance that it used to live through the winter at Hardwick, being planted in four of the large beds, just away from the fountain in the large flower garden. In May, when the

FIG. 63.—*GALANTHUS MAGNET* IN THE GLASNEVIN BOTANIC GARDENS (see p. 129).

singly in small pots and wintered in a cold house, according, I presume, to the district or situation.

An annual increase and renewal by propagation was recommended, except in the case of very fine varieties, and then, immediately after flowering, the plants were cut back—"they speedily push and become handsome plants."

The Wallflower delights in a good, mellow loam, vegetable soil and well-rotted cow-dung, the double forms responding freely to generous treatment; they are excellent as pot plants, and it is well to grow them in the open garden until late autumn, then pot them and grow on in a cool house or pit.

"In floral language, the Wallflower stands as the emblem of fidelity in misfortune, because it attaches itself to the desolate, and enlivens the ruins which time and neglect would otherwise have rendered terrible. It hides the savage strokes of feudal times on the castle walls, fills the space of the wanted stone in the mouldering church, and wreathes a garland on the crumbling monument no longer noticed by friendly relations." (*Horticultural Cabinet*, 1848). These plants were at one time termed Wallflower Stocks; in France they were extremely popular, being termed the Gold Stick, the Golden Branch and the Golden Garland.

Seeds of a good strain of present-day varieties will yield a large percentage of double flowers, and dwarf or tall forms may be obtained.

usual bedding-out was done, the spaces between the *Verbena* were planted with *Pelargonium Manglesi*, a silver bicolor; with much of the growth white or a creamy-white, and having trusses of small, pink flowers, it made a very effective combination with the *Verbena*. *R. W. Norman, Trelissick Gardens, Feock, near Truro.*

## TREES AND SHRUBS.

## BUDDLEIA GLOBOSA.

THIS fine old shrub does not seem to be planted quite so freely these days as in the past, varieties of *B. variabilis* and other kinds having perhaps diverted our attention from the once more familiar species. But *B. globosa* is still without a rival in the genus, for it is unique in the colour and arrangement of its flowers and quite distinct from any other species. Apart from that, this Chilean *Buddleia* is a remarkably handsome subject and a shrub of such good qualities few can afford to ignore.

Here, on the west coast, the pale green, lance-shaped leaves are retained on the plant throughout the winter, and very attractive they are with their undersides coated with a creamy-brown felt, which is also found on the younger wood.

The fragrant flowers, forming balls of bright orange-yellow, nearly an inch in diameter, are

# CLIBRANS' SUPERB 'GOLD MEDAL' ANTIRRHINUM

[Photo]

Clibrans' Antirrhinums in the Public Gardens at Norwich.

[Clibrans]

*The following are of the 'Intermediate' type; the finest of all for bedding purposes:*

- CLIBRANS' AMBER QUEEN, canary-yellow, overlaid chamois pink, golden lip
- CLIBRANS' BUFF QUEEN, a lovely variety, shading from buff-yellow to apricot
- CLIBRANS' CARMINE QUEEN, bright carmine, fine
- CLIBRANS' CRIMSON QUEEN, richly coloured dark self
- CLIBRANS' MAIZE QUEEN, primrose-yellow, suffused rose, a charming colour
- CLIBRANS' MAUVE QUEEN, rosy mauve, lovely
- CLIBRANS' ORANGE QUEEN, brilliant orange-scarlet, striking and effective
- CLIBRANS' PINK QUEEN, deep flesh-pink, fine
- CLIBRANS' PURPLE QUEEN, dark crimson flowers, very dark foliage
- CLIBRANS' SALMON QUEEN, brilliant apricot-buff, yellow centre
- CLIBRANS' SCARLET QUEEN, brilliant scarlet, grand
- CLIBRANS' WHITE QUEEN, a particularly fine large-flowered white
- CLIBRANS' YELLOW QUEEN, rich golden yellow, a lovely colour
- CLIBRANS' SUPERB MIXED, a choice mixture of lovely colours

Each, per packet 6d.

borne in splendid terminal panicles in early summer, the shrub continuing in bloom for several weeks.

*B. globosa* is said to be hardy at Kew and here it will withstand 20° of frost without injury. As the blooms are borne on the wood made the previous year, any pruning that may be needed should be done so soon as the flowering season is over.

#### JASMINUM REVOLUTUM.

FOR growing as a bush in the open, I find this species the most satisfactory of the Jasmines. It attains a height of some four feet to six feet, making a lax, open-habited shrub. Here it is evergreen; the dark green, alternate leaves are composed of from three to five or more leaflets.

The flowers appear in bold clusters at the tips of the branches in the later spring and summer, and their rich, bright yellow has a most effective setting in the sombre foliage. In this district *Jasminum revolutum* is absolutely hardy, even the foliage being uninjured by 15° to 20° of frost.

It is an easy, vigorous shrub, quite capable of flourishing for years with the scantiest of attention and, if need be, in the poorest of soil.

*J. humile* and *J. triumphans* of some lists appear to be identical with, or closely allied to the above. A. T. J., Conway, N. Wales.

#### RHODODENDRON PRAECOX.

EARLY in the year, while most of the hardy *Rhododendrons* are still dormant, this hybrid unfolds its exquisitely clear, rose-tinted, bell-like blooms. Looking across the slopes on a January day to a fifty yards long hedge of *Rhododendron praecox* in full bloom, one cannot but think that this must surely be the brightest and most profusely-flowered winter-blooming shrub.

The plants in the long row are smothered with flowers, each of the innumerable twigs terminating with a cluster of delicate blooms.

Millais, in *Rhododendrons*, remarks: "The flowers of *R. praecox* are resistant to frost, and I have seen them endure 8° without injury." Bean, in *Trees in Shrubs*, on the contrary, states "flowers almost invariably cut off by frost."

*R. praecox* is a garden hybrid raised by an Ormskirk grower about 1860 from *R. ciliatum* × *R. dauricum*. The dark green leaves are sparsely covered with short hairs.

This precocious subject, apart from its value for garden decoration, is one of the least exacting of forcing shrubs. Plants lifted during a mild spell in early winter and potted into receptacles just large enough to hold the ball of fibrous roots, will respond to gentle forcing and flower in mid-winter. As the flowers fade they should be removed to give the young shoots every encouragement to grow freely. F.

#### NOTES FROM GLASNEVIN.

In spite of severe frost and the fiercest gale experienced for many years, the end of January and early February saw many plants in flower, and during the second week of the latter month signs of great activity were observed among early flowering species.

*Viburnum grandiflorum* (*V. nervosum*) is striking, the stark, bare shoots bearing at nearly every node a cluster of deflexed pink flowers, which are also sweetly-scented. The habit of the plant is not particularly pleasing, especially in winter; two main shoots are seven feet high (Fig. 64), and but sparsely branched, except at the base where the laterals are beginning to develop.

Old favourites like *Chimonanthus fragrans* and *Lonicera Standishii* are flowering well, the latter, indeed, profusely. Both are sweetly-scented and excellent for cutting.

*Daphne hybrida* (*Dauphinii*) should be grown by all who love winter-flowering shrubs. The flowers are produced in clusters after the manner of most *Daphnes*, and though somewhat hidden by the leaves, the plant being evergreen, are

nevertheless not inconspicuous, being of fair size, reddish-violet, and sweetly-scented. *Daphne Blagayana*, with corymbs of creamy-white flowers terminating the shoots, is just opening and never fails to arouse interest. Difficulty is sometimes experienced in establishing this species, but here it seems to do equally well in sun or shade, asking only for good loam and to have the shoots weighted down with stones, leaving only the points free. Nor does lime appear to matter, for although our staple soil is calcareous, the loam brought in is not, and this is used for the annual top-dressing.

*Rhododendron dauricum* and *R. mucronu-*

FIG. 64.—VIBURNUM GRANDIFLORUM IN THE GLASNEVIN BOTANIC GARDENS.

latum flowered in great profusion and were in full beauty when the frost came. The latter withstood freezing much better than *R. dauricum* and it took three nights with 10°, 10° and 13°, respectively, of frost, to destroy the flowers. Now we have *R. praecox* just opening and *R. parvifolium*, *R. moupinense* and *R. Nobleum* in bloom.

Although *Parrotia persica*, one of the *Hamamelidaceae*, grows well at Glasnevin, the species of *Hamamelis* have not yet grown satisfactorily. The *Parrotia* has produced its clusters of red stamens profusely this year, but *H. japonica rubra* and *H. Zuccariniana* are the only members of that genus to make any show.

*Sarcococca Hookeriana digyna* is one of the best of a genus that has become fairly well-known since the advent of certain Chinese species. The reddish-brown shoots, bearing leaves with the same colour carried up to the midrib, are now bearing small clusters of flowers with pink-tinted bracts at the base of the stamens. The newer *S. humilis* has been in flower for several weeks, and always betrays its presence by the sweet Hawthorn-like scent of the flowers; in this species the shoots and leaves are uniformly green. The first of the *Ribes* to flower is *R. laurifolium*, the male plant of which is now bearing many racemes of greenish-white flowers.

*Iris unguicularis*, still in full bloom, has been flowering well since the beginning of the year. It is represented here by some half-dozen forms; of these, *alba*, *Imperatrice Elisabethae*, *marginata* and *speciosa* are in flower. These are grown close under the walls of the plant houses, fully exposed to the sun, and with the roots confined. Also in a narrow border, the wild form of *Narcissus Tazetta* has flourished for years and rarely fails to appear soon after Christmas, flowering early in the New Year.

*Lithospermum rosmarinifolium* seems to enjoy exposure and a confined root-run; it is very attractive now with a fine crop of beautiful blue flowers.

The Hellebores are best known perhaps by the beautiful Christmas Rose, *H. niger*, of which there are many forms, but some other species are not without interest. *H. corsicus*, with long-stalked, deeply-lobed leaves, the lobes strongly-toothed, and corymbs of pallid-green flowers, is excellent for semi-wild parts of the garden. The deep green *H. viridis*, of lowlier growth, is also distinct and interesting; of this there are several varieties. *H. atrovirens*, taller and with larger flowers, green, tinged with purple, is probably a hybrid of *viridis*, and one of the reddish-purple-flowered species. *Polygala Chamaebuxus purpurea*, in peaty soil and facing north, is flowering freely; this is a cheerful little evergreen, admirable for the rock garden in association with dwarf *Rhododendrons*.

*Anemone blanda scythica* is now in flower and is always admired for the deep blue colour on the outside of the petals, which are white within. The first of the *Hepaticas*, viz., *A. Hepatica angulosa*, has also opened its pale blue flowers.

*Saxifragas* are coming on apace, the earliest being the yellow-flowered Caucasian species, *S. Desoulavyi*, followed closely by a form of *S. apiculata*, known as *Albertii*. The only advantage the variety has is its earliness, the type in my opinion being superior in habit and flower. *S. Bursaria tridentata* and *S. Bursiculata* both have a few flowers open. A fine bit of colour is provided by a group of *Cyclamen Coum* growing at the base of *Pinus Thunbergii* on the edge of the rock garden. Nearby, in the rock garden proper, *Iris Vartanii* with bright, blue flowers, is nearly over, but *I. persica Tauri* is in full bloom.

Almost in the centre of the rock garden stands a Stone Pine with a small patch of grass in front, colonised by *Cyclamen repandum*. Just where the grass joins the rocks the collection of *Snowdrops* is grown. This is one of the most interesting collections in the garden, particularly at this season, and surprises many people who are not aware of the number of species and varieties in cultivation. It is a matter of opinion whether the common *Snowdrop*, *Galanthus nivalis*, is surpassed in beauty by any of the others, but some of the larger-flowered species are certainly very beautiful. Without giving detailed descriptions, the following are now in flower:—*Galanthus Allenii*, C. Arnott's Seedling (presented by the late Mr. H. J. Elwes), *G. cilicicus*, *G. caucasicus*, *G. Elwesii*, *G. Elwesii unguiculatus*, *G. Elwesii* × *plicatus* (also from Mr. Elwes), *G. Fosteri*, *G. Itariae* (flowers just showing colour), *G. latifolius* and *G. latifolius Wisley var.*, *G. maximus*, *G. Magnet* (Fig. 63), *G. plicatus* and *G. plicatus Newry Giant*, *G. robustus* and *G. Olga*. Several *Crocuses* are in bloom including *C. chrysanthus*, *C. Fleischeri*, *C. laevigatus* and *C. Sieberi*, and every day that passes will bring others. J. W. Besant.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and advertisements should be addressed to the PUBLISHER and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

## MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA\*

### VI.—AN INTERLUDE.

ARRIVED at the mouth of the Seinghku valley, I felt that we really were getting on; but so, too, was the season, and I was impatient to thrust ahead until I came into direct contact with the flowers I sought. The difficulties of the position were beginning slowly to dawn on me with every march from Fort Hertz, and I spent a restless week-end deciding whether to continue up the main valley (the Adung) or to branch off up the Seinghku; however, being stuck here for four days before anything at all happened, I had plenty of time to weigh the pros. and cons. Had the season been less advanced, I would have had no hesitation in continuing up the main valley, as originally intended; but the disastrous famine amongst the Mings and Tarons, combined with the lateness of the season, put a different complexion on the problem. The difficulty was, of course, two-fold, the fundamental one of food and transport. There is no need to go over the whole ground; it will be enough to say that, broadly speaking, from this point on neither existed. Since leaving the safe anchorage of Fort Hertz, I had been wandering about the shifting sands which support, and anon engulf, human life in the jungle, anxious indeed to go ashore on to an uninhabited island which rose above the surge of the forest, but unable to do so unless I could establish a life line, however slender, between it and the mainland I had left behind. Under the conditions, the shorter the line the better, so I immediately turned my attention to the Seinghku.

This valley is about fifty miles long, and at its head is the Diphuk La, 14,300 feet, a pass which leads directly to the Lohit river, in eastern Tibet, thus crossing the main Irrawaddy-Brahmaputra divide. Peaks of 17,000 to 18,000 feet block all exit from the valley except at this one weak link in the chain, and though none of these are covered with perpetual snow, numerous snow beds testify to the existence of glaciers at no very remote date. A little further to the

north are several snow-peaks upwards of 19,000 feet high, so that could I establish a camp well up the valley, I should have no difficulty in reaching my goal.

However the immediate obstacles were undoubtedly alarming; and when four days had passed without sight or news of a single coolie, I began seriously to consider the advisability of establishing my base camp at the Seinghku-Adung confluence. However, on reflection, I decided that a worse site, imprisoned in the jungle, at a feverishly low altitude, could hardly be devised; and that despite the time it would take to move up the valley, horse, foot and guns, it would still be better to be a little late, and make a dump at about 7,000 feet, rather than hold on to a position which was weak from every point of view. Besides, from the higher camp, even in the event of a complete collapse of the supply and transport arrangements, it would still be possible to make daily excursions,

The four days, May 9-12, 1926, were devoted to local excursions, but I found myself badly cramped. There was no way of crossing the Adung, and although there was a bridge over the Seinghku, just above the confluence, it led nowhere except back to the path we had come by; I might add that this bridge was peculiarly nerve-splitting. There remained the right bank of the Adung, which I followed up for a mile, till checkmated by a big torrent, and the left bank of the Seinghku. Several attempts to scale the cliffs which formed the apex of the wedge between the two rivers proved completely abortive.

A short distance up the Adung, I came upon a delicious sight. At one point a large Alder growing on the edge of the jungle, leaned over till its broad crown shadowed the middle of the river, where it interlocked with the branches of another tree leaning from the opposite bank (Fig. 68). Immediately above and below this span

FIG. 65.—INDO-MALAYAN JUNGLE TREE FERNS AND RHAPHIDOPHORA.

and with a handful of coolies I could establish and ration, a small mountain camp. I therefore decided to wait and see.

When I turned in, on the night of our arrival at the confluence, the wedge of sky to the south, framed between the cliffs of the Nam Tamai, was beautifully inlaid with stars, the red tail-light of Scorpio glowing in the very centre. A few hours later, I awoke, dreaming that someone had summoned the local fire brigade; a stream of water was playing on my head, and a syncopated dripping noise told of other streams directed elsewhere. I soon found that the hut was not really on fire, but that the roof was uncommonly well ventilated, and it was raining very heavily outside; after a brief spell of aquatic sports, directed to protecting my scattered belongings, I returned to bed. Next day temporary repairs were effected, the thick jungle which threatened to overwhelm the hut, cut back, and the starving coolies dismissed.

arch, the river frothed amongst the rocks, which showed their teeth in a grim grin, but beneath the arch it was sleek and smooth, of a deep jade green. From either tree trunk spouted a fountain of Rhododendron blossom, the one pearl-white, the other blush, converting the arch into a natural pergola, and from time to time a pink or white corolla fluttered down like a wounded butterfly and swam away in the smooth stream. This was *R. dendricola*, the commonest species hereabouts, and, indeed, almost the only one. The flowers may be quite white, or definitely flushed pink; I am inclined to think that they change colour with age, opening pink and gradually fading to white; the buds are definitely pink. But it is certainly a variable plant.

Across the Adung, I noticed a large, white-flowered species which might have been *R. Nuttallii*, and near by was an epiphytic species with cream trumpet flowers, possibly *R. Dalhousiae*. It may be noted that in the lower jungle, where Rhododendrons occur at all,

\* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, 1927.

Supplement to the GARDENERS' CHRONICLE.

EUCRYPHIA PINNATIFOLIA.

they are always scattered, and merely an incident in the vegetation, being generally epiphytic. With the exception of *R. indicum*, the only series represented is 'Maddeni.' Even when we came to the next tier, with a

FIG. 66.—LOWLAND RIVER SCENE; HEAD-WATERS OF THE IBRAWADDY.

much more varied representation, the species remain scattered, never forming solid colonies, nor even a considerable proportion of the forest. Their removal would little affect the appearance of the vegetation, though here we find species of

FIG. 67.—CAPT F. KINGDON WARD'S HEAD COOLIE A MING OF THE NAM TAMAI.

the 'Irroratum,' and 'Stamineum' series—all moderate sized trees—besides epiphytes of the 'Maddeni' and 'Vaccinioides' type. It is not till we reach the temperate rain forest at 8,000 to 9,000 feet, with its big-leaved tree 'Grandes,' that we find *Rhododendrons* growing

in a solid phalanx. Here they are no longer incidental, but dominant, and from this point upwards, their proportion is continually increasing, till finally, in the alpine region, they are often the *only* woody plants. Here and there, amongst the rocks, grew clumps of gaudy purple *Impatiens*, a genus represented in this country by a large assortment of species. But so dark and damp was the jungle that hardly anything but Ferns and Moss could grow there; it was only in the river bed, or by the path, or on the edge of cultivation that one saw flowers.

Ferns in particular were extraordinarily abundant and varied, of all sizes and shapes, from the delicate filmy Ferns to the giant birds' nest Ferns, with fronds three feet long, and the much bigger Tree Ferns. They grew on the trees and on the cliffs, on the ground,

happened a few months later. We had fine days and drizzling days, the temperature on one occasion (May 9) rising to 80° in the shade, the lowest temperature recorded being 54° the same morning.

At last, on May 13, fifteen coolies from the Adung valley arrived, and I dispatched them up the Seinghku with stores and rations. They returned the following morning, and made a second trip, and on the 15th I was able to start myself with the remaining kit.

To begin with, the path kept close to the river, and presented no difficulty; but as the gradient increased, we had to climb cliffs, ascending and descending by improvised ladders, or hauling ourselves up by means of roots and cables. Finally we reached a tiny meadow, with a cultivated terrace above. One sensed

FIG. 68.—NATURAL PERGOLA OVER THE ADUNG RIVER; RHODODENDRON DENDRICOLA AS AN EPIPHYTE.

and even amongst the raw boulders in the river bed. Most of them are provided with distinct drip tips, or else are so finely subdivided that they shed water as hair does. Amongst numerous climbing plants I noticed species of *Ficus*, *Smilax*, *Vitis*, *Schizandra* and *Akebia*.

Birds were fairly plentiful, and several, including a plump grey-backed finch were constant visitors. Insect life abounded, and I caught a specimen of the ridiculous, long-necked *Apoderus*, besides many other interesting beetles. Less amusing were the blood-sucking insects which took an interest in us.

Cooped up at the bottom of the valley, we certainly saw life here. One hot afternoon we were treated to a severe earth tremor, and the hut rocked till I thought it must inevitably collapse over my head—as actually

a village here, and the place had a solemn name; actually there were three widely scattered huts, with an effective population of two, the remaining half-dozen being old women and small children.

Two temporary shelters had been built for me, in one of which I put my boxes, while the men lived in the other; I pitched a tent for myself. The coolies, who had done three days' work, had now to disperse, being without food; and once more I was called upon to endure a delay which, with each successive advance, became longer. Altogether, we spent six days (May 16-22) here, while my log hut was being built at the Tibetan village a few miles up the valley. The altitude of this camp was about 5,000 feet, and the mountains were everywhere clothed with thick forests. *F. Kingdon Ward.*

## FARRER'S PLANTS AT EXBURY.

THE recent publication of Mr. Euan Cox's book on *Farrer's Last Expedition* suggests to me that it might be interesting to your readers to have the following account of the plants from that expedition raised at Gunnersbury and now growing at Exbury and elsewhere.

This was the first time that I had anything to do with the raising of plants from Chinese seeds and, although the largest amount of seeds sent to any one individual came to me, I did not realise the difficulty of getting certain kinds to germinate and distributed seeds widely to various friends, many of whom were also unaware of the difficulties of raising Magnolias, for instance, from imported seeds. It must also be remembered that Exbury is a new garden and there is no place there for growing alpine or similar plants which cannot look after themselves, and for this reason the majority of those surviving are hard wood shrubs.

Since Farrer's last expedition many seeds have come to Exbury but I shall always feel a particular affection for the results of this one, which ended so disastrously, and whenever I look at the numerous plants raised from it—now growing so well and giving so much pleasure, I regret that Farrer did not survive to receive our thanks and see the results of his toil.

The numbers preceding the names are Farrer's.

801.—*Rhododendron Mackenzianum*.—Killed in the open at Exbury; 8 feet high in greenhouse. A plant 6 feet high, taken out to New Zealand by Mr. Edgar Stead, was bent over in the case and sprouted throughout its length during the voyage. It bloomed this spring (October), but, "the two mauve, sweetly-scented flowers were slightly malformed."

811.—*R. araiophyllum*.—Killed in the open, 2 feet high in the greenhouse.

812.—*R. tanastylum*.—1-1½ foot in the open, 4 feet in the greenhouse. Like many of the 'Irridiums,' this plant seems to get harder with age, and 18° of frost last year left it untouched, perhaps because it was sprinkled with snow.

813.—*R. cerinum*.—1 foot 10 inches high in the greenhouse. Attractive Buttercup - yellow flowers indoors; a plant in the open has not yet flowered.

814.—*R. heptamerum*.—1½ foot high in the open.

815.—*R. aemulorum*.—2 feet high in the open.

823.—*Primula linnoica*.—This *Primula* flourishes at Exbury and is one of the most attractive grown there; it is of a very attractive lavender-blue colour and of considerably more graceful shape than *P. cashmeriana*. It seems quite perennial and seeds freely and has been distributed to many friends who have admired it; fully open at the end of March or early April.

825.—*Rhodoleia Championii*.—One plant against a wall has survived some five winters and is 4 feet high. Other plants in the wood all succumbed in 1923 and 1924; 6-9 feet high in the greenhouse. At Lanarth there is a good plant growing in the open, 4 feet high by 4 feet wide.

839.—*Gordonia axillaris*.—All plants in the open were killed. Plant in the greenhouse 12 feet high. At Lanarth there is a good plant growing in the open, 5 feet high by 4 feet wide.

842.—*Rhododendron bullatum*.—Some half-a-dozen plants have survived in the open at Exbury, but are only 1 foot 3 inches high; 4 feet high in the greenhouse, where it blooms freely, producing large, sweetly-scented white flowers.

863.—*R. arizelum*.—2 feet 6 inches high in the open.

867.—*Jasminum pubigerum*.—A bush, 6 feet 10 inches high in the open, with scentless, small, yellow flowers. Fruits freely at Exbury.

869.—*Pieris* sp.—3 feet high.

871 and 1,015.—*Clematis Spooneri* (?).—Some 8 feet high, against a wall, and then a tangled mass. Attractive flowers similar to, but larger and of more substance, also of a more ivory-white colour, than those of *C. montana*.

872.—*Rhododendron sidereum*.—1½ feet high in the open.

873.—aff. *R. basilicum*.—2 feet high in the open. Fine foliage.

874.—*R. fulvum*.—2 feet 9 inches in the open.

875.—*R. desquamatum*.—6 feet 6 inches high in the open. Flowered in a greenhouse at Tittenhurst in April, 1925, where I saw some flowers considerably larger than those of *Augustinii*, of a good bluish-mauve. Most attractive.

876.—*R. oulotrichum*.—2 feet 3 inches high in the open.

877.—*R. phoenicodum*.—1 foot high in the open. Good scarlet flower. Rather difficult. Similar to *R. euchaites*.

878 and 1,065.—*R. plebeium*.—3 to 4 feet high in the open. Flowers quite attractive.

887.—*R. glischrum*.—This was originally sent over as *R. habrotrichum*, but all the plants raised from seed of this number at Exbury and elsewhere (including Edinburgh) are *R. glischrum* or very near it. Three feet high in the open.

888.—*R. sperabile*.—2 feet high in the open. Good scarlet, but poor truss and not so fine as *R. haematodes* at Exbury, either in colour or form.

891.—*R. zaleucum*.—2 to 3 feet high in the open.

903.—*Manglietia insignis*.—This plant seems perfectly happy at Exbury. One in the open is 6 feet 6 inches high, and another against a wall is 7 feet 6 inches high, while two plants in the greenhouse are each over 12 feet high.

909.—*Morus indica*.—13 feet high in the open.

918.—*Rhododendron megacalyx*.—6 inches to 10 inches high in the open; in the greenhouse 2 to 3 feet high and flowers freely, having large, white, tubular, sweetly-scented flowers.

926.—*R. aiolosalpinx*.—2 feet high in the open. At Tittenhurst this flowered in a greenhouse; cream with tinge of pink, pink spots.

937.—*R. caloxanthum*.—1½ foot high in the open. Has flowered in the greenhouse; flowers similar to those of *R. campylocarpum*.

952.—*Philadelphus coronarius* var. *tomentosus*.—8 feet high, and flowers freely.

953.—*Rubus biflorus*.—Good white-washed Bramble, 10 to 12 feet high.

959.—*Rhododendron sino-grande*.—3 feet high in the open. Leaves 1½ foot by 8 inches.

968.—*Hypericum Hookerianum*.—2 feet 6 inches high in the open.

975.—*Rubus* sp.—10 feet high in the open, but slightly tender and frequently gets cut back.

976.—*Saxifraga purpurascens*.—9 inches high. Attractive, purple-leaved plant with magenta crimson blossoms.

979.—*Rhododendron, decorum* form, near *R. diaprepes*.—4 feet 6 inches high in the open. Flowered in the open last year.

989.—*Pyrus Vilmorini* vel aff. (?).—This name was supplied by the Royal Botanic Garden, Edinburgh, but my specimen resembles *P. Harroveana*. 2 feet high.

1011.—*Magnolia rostrata*.—6 feet 7 inches high in the open. Three plants were raised and one died, the second went to Cornwall. The plant at Exbury has been out three winters and seems to like its situation. It is a bushy plant with magnificent leaves as large as those of *M. macrophylla*, but so far it has shown no sign of flowering.

1016.—*Rodgersia aesculifolia*.—Most attractive. Sprays of pink flowers 4 feet high. Has been distributed freely from Exbury.

1022.—*Rhododendron facutum*.—2 feet 9 inches in the open, 5 feet high in the greenhouse. Some twenty plants of this are growing in the open at Exbury, and I cannot distinguish it from *R. eriogynum*, which is growing by it, from Forrest's seed. It has set flower buds this year in the greenhouse.

1024.—*R. scyphocalyx*.—1½ foot high in the open.

1030.—*Berberis Wallichiana*, D. C. var.—2 feet 6 inches high.

1034.—*Ilex odorata* var.—Gets killed to the ground in hard winters, is now 6 inches high again in the open. At Caerhays there is a nice plant, 8 feet 4 inches high.

1035.—*Tripterygium Forrestii*.—Some 3 to 4 feet high in the open; in the greenhouse 15 to 20 feet. Fruited last year.

1044.—*Rhododendron crassum*.—6 feet 6 inches high in the greenhouse. At Lanarth there is a fine plant growing in the open, 5 feet by 5 feet, which flowered freely last year, producing particularly fine 'Maddenii' flowers. Neither in flower nor in foliage is this typical *R. crassum*; it is a finer form in every respect.

1045.—*R. calostrotum*.—1½ to 2 feet high in the open. What appears to be a natural hybrid between this and *Trichocladum* series has appeared amongst the plants raised from this batch of seed, some twenty to thirty plants growing much stronger, some 3 to 4 feet high, and with flowers of a pale straw colour.

1046.—*R. myrtilloides*.—1 foot high in the open.

1089.—*Spiraea bella*.—3 to 4 feet high. Not much value.

1096.—*Luculia Pinceana*.—Killed in the open; 4 feet high in the greenhouse.

1098.—*Hedychium coccineum* var.—Was gradually killed in the open; alive in a house.

1122.—*Lilium nepalense* var. *burmanicum*.—Flowered in the greenhouse.

1153.—*Spiraea virgata*.—1½ to 2 feet high in the open. Very attractive, small leaves. Much admired and distributed freely.

1191.—*Gaultheria trichophylla*.—6 inches high 1½ foot across. Very attractive, evergreen with blue berries. Fruits at Exbury.

1238.—*Buddleia Forrestii*.—13 feet high and nearly as much through in the open. Not worth growing in this country, although it flowers at Exbury; dull cream with orange eyes, and sometimes tending towards lilac.

1324.—*Gaultheria laxiflora*.—Sprays of leaves 5 feet long; the black fruits set freely at Exbury.

1325.—*Cotoneaster* aff. *C. Franchetii*.—12 feet high at Exbury. Attractive in fruit.

1399.—*Berberis capillaris* (?).—Fine autumn colouring; good fruit.

1407.—*Juniper*, "Coffin Tree."—6 feet 3 inches high; growing well.

1408.—*Quercus* sp.—Is frequently cut by frost, but continues to grow, nevertheless.

1415.—*Embelia floribunda*.—5 feet high in the greenhouse; 1½ feet high against a wall.

1420.—*Vaccinium Delavayi*.—1 foot in height by 1 foot through.

1428.—*Araliad*.—Three plants over 22 feet high at Exbury, some half-a-dozen others are smaller; has not yet flowered.

1433.—*Viburnum* (?).—2 feet 6 inches high.

1435.—*Picea* sp.—3 feet 2 inches high; growing well.

1442.—*Prunus Persica*.—12 feet by 12 feet through. Has flowered but not fruited yet at Exbury. Retains its leaves until the new year.

1444.—*R. Kyawi* (?).—6 feet high in the greenhouse; killed in the open. I have this *Rhododendron* growing side by side with *R. prophanum*, and cannot distinguish between them although these two are quite distinct from *F. 1022*, *facutum* and *eriogynum* group.

1446.—*Callicarpa*.—Attractive violet fruits; may be a new species. 8 feet high in the greenhouse, nearly as tall against a wall, but has not yet been out long enough to decide on its hardness. *Lionel de Rothschild*.

## NOTICES OF BOOKS.

## A Dutch Year Book\*.

THE 1927 edition of the *Tuinbouw Jaarboek* (Gardening Year-Book) is the second which has been published, the first having proved very successful. It is a useful little publication, with plenty of information in it of a kind which would not be easily accessible elsewhere—for instance, the names, with Secretaries' addresses, of the bewilderingly numerous associations, societies and federations in which horticulturists and land-workers of all kinds in Holland are enrolled. Mr. Ernst H. Krelage contributes a very interesting article on thirty years of experience in horticultural exhibiting, and other articles are included on Fruit Sorting and Packing, Vegetable Growing in the Maastricht District, Tomato Cultivation, etc.

A list of German import duties on fruits and vegetables will no doubt be of great value to Dutch growers, and the list here given appears to be exhaustive and clearly set out. The section on Dutch horticultural education is a revelation of the excellent work which is being done in this way, and which might put to shame many larger and wealthier countries.

## Seed Trays of distinction

Please quote reference H.D.

**GEORGE MONRO LIMITED**

Sundries Department

4 Tavistock Street, London, W.C.2

The G.M.L. mark of seed trays has established something of a reputation within the last few years. They are specially imported Redwood, cut by mills who put defective boards in the furnace. The trays are made up in the same careful fashion as the Monro Tomato Box, and share with this the reputation of "the best on the market."

Quality tells in the long run, even in Seed Trays, and we have contracts for upwards of half-a-million sets—say 3,850 gross—for the present season.

Stock is on hand at Waltham Cross and open to inspection. We are thus in a position to execute orders as soon as received, and before the Tomato season work is needed for the factory plant.

Particulars of standard sizes and prices as follows:—

Inside Dimensions.	Prices per Gross.	
	In sets.	Made up.
14 × 8½ × 2 ... ..	15/-	19/-
14 × 8½ × 2½ ... ..	16/9	20/9
14 × 8½ × 3 ... ..	18/9	22/9

Carriage forward.

We shall be happy to quote prices, carriage paid, by rail or road, on receipt of particulars as to quantity, this having an important bearing on the rates.

Lowest Rates by rail are in force for a 2-ton lot of sets or a truck-load of made-up trays. By rail the made-up trays travel much better in whole truck-loads, of course, as this saves handling and mixing with other consignments.

It should be noted that the dimensions quoted are inside measurements. Add one inch to the length and half-an-inch to the breadth to arrive at 15 in. × 9 in., commonly quoted in the trade. In addition to trays of these dimensions, a large stock is on hand of other sizes up to 4½ in. deep, up to 11½ in. wide, and up to 17 in. long, at proportionate prices.

## ECONOMIC PLANTS OF THE BAY ISLANDS (HONDURAS).

(Continued from p. 118).

### VEGETABLES.

#### CASSAVA.

THE root of the Cassava plant, or Yuca (*Manihot* sp.), family Euphorbiaceae, is one of the most important articles of food in the Bay Islands. This plant reaches a height of five to eight feet, and it has a woody, knotty stem of greenish or red colour, surmounted by palmate leaves consisting of five or seven leaflets.

The Cassava is a native of tropical America and its home is said to be in Brazil, but it was taken from the latter country to other parts of the tropics, and it is now extensively cultivated in Africa. This plant prefers sandy soil, rich in humus, and grows from sea-level to an altitude of 4,000 feet (say, 1,200m.); it may even prosper in higher regions but in them its roots are of inferior quality. This Cassava is propagated by cutting the stem in lengths of about half-a-foot each and sticking these in the ground about five feet apart. It takes nearly a year from the time of planting to complete maturity. By removing the young flowers, the roots are encouraged to grow to a larger size and become richer in starch. When taken from the ground the tubers soon deteriorate, but in the soil they will keep well for a year or even more after maturity.

There are many varieties of Cassava producing roots of white, yellow or reddish colour, and these again differ in size, shape and taste. Common distinction is made only between Sweet and Bitter Cassava. The Sweet Cassava (*M. palmata* Aipi) is generally eaten as a vegetable, but occasionally it is grated and baked in thin, small, circular loaves or cakes, called locally Cassava bread or bammies.

The Bitter Cassava (*M. utilisima*) is the staple food of the Caribs, but is not cultivated at all by the other inhabitants of the Bay Islands. It yields more tubers than Sweet Cassava, and these are made into bread and starch, after squeezing out the milky juice which contains hydrocyanic or prussic acid. The Caribs make use of this juice in cooking, expelling its poisonous qualities by heat.

#### YAM.

Another very important foodstuff of the Bay Islands is the Yam, Name or Yame, the starchy tuberous root of various species of *Dioscorea*. This plant is said to be of African origin, introduced into the New World by negro slaves. Nevertheless, wild species of Yams are found in the neighbouring mainland of Central America, and also in other parts of the lowlands of tropical America. In the Bay Islands they replace the Potato to some extent, but the flesh even of the better varieties is coarser and less palatable. The Ladinos do not cultivate this plant.

The tubers are produced in the ground at the end of a long, slender, climbing vine and reach a weight up to thirty pounds (13.6 kg.) and more. The planting of the Yam is carried out in the following manner. The tuber is cut off close to the top so that a small part is left attached to the vine. This cut-off part is then put back into the ground, covered with soil, and after three to four months a new Yam, known as the head (*cabeza*, *cabo*) is formed. The latter is never eaten, but it is cut up in several pieces, taking care that each one of these divisions is provided with an eye. These parts are then planted in the ground and from them new plants will grow.

There are many varieties of Yams, of which the following are the more common:

The White Yam (*D. alata*), which is the most common variety of all; this has a square stem and large, heart-shaped, opposite leaves.

The Negro Yam (*D. alata* var. or *D. sativa*), is also white, but it has a round stem with very small prickles on the lower part, and it has heart-shaped, alternate leaves. The tuber is somewhat brittle and it does not keep so long as does the White Yam after being dug up.

The Yellow Yam, also called Guinea, Afou, and Afou Yam (*D. aculeata*) has also a round stem with small prickles, and its leaves may be either alternate or opposite. Its yellow tubers

are highly esteemed. These three varieties have very large tubers and heart-shaped leaves.

The Indian Yam, known also locally by the Jamaican name of Yampee, Spanish Yampa (*D. trifida*), has its leaf divided into three leaflets and bears much smaller, round tubers, of very good quality. Two varieties of this are found in the Bay Islands, one bearing white tubers and the other purple; the latter is by far the more common.

#### EDDO AND SWEET POTATO.

Another important vegetable is furnished by the tubers of several plants known locally by the Jamaican name of Coko (*Xanthosoma* sp. and *Colocasia* sp.), and in other parts of the British West Indies as Eddo and Tania. This is the Elephant's Ear of the North Americans. There are many local names in Spanish America, and in Honduras they are called Yautia and Malanga. The plants belong to the genera *Xanthosoma* and *Colocasia*, which are of similar appearance and habit, and few travellers have distinguished between them. The former has the

low altitudes; in Central America it does not do well at an elevation above 3,500 feet (say, 1,000m.). The Sweet Potato is a vine with a trailing stem and purple flowers. As it creeps along it sends down roots from every node resting on the ground, and from these roots develop numerous tubers—the edible part of the plant. *Edouard Conzemijs*, 33, Boulevard des Batignolles, Paris.

(To be continued.)

## THE DUTCH ELM DISEASE.

DURING the past few years a serious disease of the Elm has appeared in several countries in North-west Europe, and in order to prevent the spread of this disease into England, the Ministry of Agriculture has recently issued an Order prohibiting the importation of Elms from Europe into this country.

The disease was first observed in Holland in September, 1919, at Tilburg in North Brabant,

FIG. 69.—TRANSVERSE SECTION OF TRUNK OF A DISEASED ELM.

leaves hastate, that is, the basal lobes are not connected behind the insertion of the stalk, as in *Colocasia*.

There are, locally, two varieties of *Xanthosoma*, one with green and the other with purplish stems; the former has white tubers, while those of the latter are reddish in colour. There is also a slight difference in taste. The large, arrow-shaped leaves may be eaten as Spinach when still young and tender. This vegetable may be grown from sea level to an altitude of 5,000 feet (say 1,500m.), but the best qualities are grown in the lowlands. Propagation is similar to that of the Yam.

The genus *Colocasia* is represented only by a single species, and this is not much cultivated; it is the plant called Taro in the Pacific Islands where it is the staple food.

The Sweet Potato, the Camote of the Honduraneans (*Ipomoea Batatas*), is also an important article of diet in the Bay Islands. It is apparently indigenous of both hemispheres and is cultivated in tropical and semi-tropical countries. It prospers best in moist soil in

and has steadily spread, until at present it is found all over that country. It was recorded over the whole of Belgium in 1921, and in the same year in France, north of the Seine. In 1924, it was found in Germany, in Rhineland, Westphalia, Bremen, Nuremberg, Potsdam and Bonn, and at Aix la Chapelle in 1925. Diseased Elms, showing exactly the same symptoms as those of the Dutch Elm disease were observed in 1926, in Oslo and in a considerable number of localities in eastern Norway, and it is probable that the disease first appeared in that country in 1920. The disease has not yet been observed in Sweden or Denmark. It has not been found in the United States.

Very extensive damage has been caused by the disease in Holland, where Elms are found frequently throughout the country. In some towns, where these trees had been planted along the road sides, the destruction has been very great, and hardly a healthy tree now remains. Several accounts of the disease have appeared in Germany, and recently it has attracted considerable attention in Norway, where a description of the disease and its occur-

ence in the country has recently been published in one of the daily papers at Oslo.

When trees are attacked, a mass of dry twigs and leaves appear in the crown, while the surrounding parts are yet green. The disease then gradually spreads over the whole tree and kills it. In young trees, from fifteen to twenty years old, the process usually takes a few weeks, but in some cases trees may lose their healthy appearance in three days, and the leaves may fall in the course of a week, leaving the tree quite bare. In trees from sixty to eighty years of age the disease spreads more slowly, and death may only take place after the lapse of several years. Such trees bud each year, but the leaf mass is thin and the leaves soon fall. Trees in which the twigs dry up early in the summer may produce fresh shoots, but these, in turn, wither. In winter, diseased trees can be recognised by the curved ends of the small twigs in the crown.

The disease has been found in the nursery where trees of four years and older are attacked. Young plants produced by layering have not been found infected.

In cross section diseased twigs and branches show a ring of brown spots just inside the bark (Fig. 69). These are usually in the outermost annual ring, but in some cases may be found in the second and third ring from the outside. In severely diseased trees, every branch from the thickest to the smallest shows the discoloration of the wood and, in many cases, this may also be seen in the roots. The bark of such trees is almost always riddled by the burrows of bark-beetles.

Almost all species of *Ulmus* appear to be attacked. The disease has been found on *Ulmus campestris latifolia*, *U. c. suberosa*, *U. monumentalis*, *U. hollandica*, *U. nitens* var. *Ruepelli*, *U. americana* and *U. montana*. *U. vegeta* is said to be not attacked in Holland.

Up to the present the cause of the disease has not been definitely determined. No fungal hyphae can be found in the diseased branches, the discoloration being due to the deposition of a dark brown granular substance in the vessels of the wood. Some investigators in Holland believe the disease to be due to the fungus *Graphium ulmi*, which has been obtained along with several other organisms from the diseased branches. Infection experiments with this fungus have, however, all given negative results.

It has also been suggested that the disease is due to physiological causes; especially the dry summer of 1921, and the cold winter of 1923-4, but as the disease is still spreading, this explanation seems inadequate. Recently, Brussoff, working in Germany, has stated that the disease is due to a bacterium, *Micrococcus ulmi*, which he has isolated from diseased trees. He states that he has carried out successful infection experiments with this organism on healthy Elm trees. Within the last year he has stated that the disease also attacks species of *Acer*, *Tilia*, *Populus* and *Fagus*, but he has not performed infection experiments on these trees. Although Brussoff's work does not appear to be altogether satisfactory, and requires confirmation, it is, up to the present, the best explanation that has been given.

As the disease is wide-spread in the four continental countries nearest to Britain, it is possible that, in spite of the prohibition of the importation of Elms, the disease may appear in this country. Any suspicious cases should, therefore, be at once submitted to mycological examination, so that, if the disease proves to be present, steps may be immediately taken to prevent its spread. Owing to its nature the disease is not one that can be easily identified and its presence can only be determined with certainty by a complete and thorough examination of the suspected tree.

In view of its very serious nature the Dutch authorities are now undertaking an extensive investigation of the disease in all its aspects. The block from which the illustration shown in Fig. 69 is taken has been kindly supplied by Miss Dina Spierenburg of the Dutch Phytopathological Service who has already published the results of an important investigation into the disease. *Malcolm Wilson, Mycological Department, University of Edinburgh.*

## NURSERY NOTES.

### PRIMULAS AT FOREST HILL.

In winter, when the out-door garden is drab and uninviting, a warm greenhouse or conservatory is a great asset, for such a house enables the owner to enjoy the beauty of flowering and foliage plants at a time when they are most appreciated. Probably the two most popular indoor winter-flowering plants in private gardens are Primulas and Cyclamens, for they are serviceable, easily grown and most attractive; of the two the Primula is supreme.

Messrs. James Carter and Co. have long specialised in these beautiful flowers, and they grow large batches of all the best varieties at their nursery at Forest Hill for the special purpose of seed-production.

The Chinese Primula may be used for many purposes, and the modern varieties reach a high standard of perfection. There is a feeling of delight in entering a glasshouse filled with bright plants, such as Primulas, in winter, for, apart from the interest of the plants themselves, there is pleasure in the genial atmosphere and even in the smell of the house, for few flowers are without perfume, and even many foliage plants emit a pleasant odour; those who know the Temperate House at Kew Gardens will remember the peculiar fragrance which always seems to pervade the place, said to be due to the roots of the Acacias grown there.

In the old days *Mimulus moschata*, the Musk, filled the greenhouse with its fragrance, summer and winter, but this plant has lost its sweet perfume and the Musk-laden atmosphere of our plant houses remains only a memory. This is a distinct loss, but modern gardeners have their compensations in the greater wealth of beautiful flowering plants for indoor cultivation in winter, and vastly improved varieties and types over those of old times. The evolution of the stellata type of Primula marked an advance so great that the Star Primulas are preferred by many, because of their lightness and better adaptability for association with other subjects than the giant forms.

Those who wish to see Primulas growing to perfection should visit Messrs. Carter's Forest Hill Nursery in the near future, for the plants have never been more beautiful than they are this season, indeed, so good were they, we asked the manager to give us some details of their cultivation. He informed us that the seeds were sown at the end of May and germinated in a temperature of about 50°. The seedlings were pricked out into boxes and when they were of a suitable size, transferred to sixty-sized pots and kept in cold frames until October. From that date they were potted into forty-eight-sized pots and taken into the glasshouses, which were kept quite cool. As the plants require very careful watering at all stages of their growth, plenty of drainage is necessary, and very porous soil should be used. The compost employed at Forest Hill consisted of three parts loam and one part leaf-mould, mixed with a liberal quantity of old mortar rubble, some sand and rotted manure. If the plants are grown well and kept perfectly hardy they are not likely to be attacked by insect pests, but fly is sometimes troublesome and if this appears the houses should be lightly fumigated, XL ALL being employed at Forest Hill for the purpose.

As Messrs. Carter's plants are grown for seed production, they are not required to flower until the turn of the year, when the days become brighter and the conditions generally more suited to seed-production than in mid-winter. If, however, the plants are required to bloom early, say from November onwards, the seeds should be sown in March and the plants grown on in slightly more heat during October and November. As the latest batches will carry on the succession of blooming until April it is an easy matter to have these Primulas in bloom for six months of the year.

With regard to varieties, it is very difficult to state which would be awarded the Palm, but, in our opinion, it would rest between

*Stellata White* and *Princess May*, which is an old, but still unsurpassed variety, having the largest flowers of its family, of a light coral-pink colour set off by beautiful, light green foliage, and borne in big trusses on strong stems; some of the individual flowers measure so much as two-and-a-half inches across. The *Duchess*, which is one of the most distinct of all Primulas, is represented at Forest Hill by an improved strain with very big flowers. It was interesting to note that of the many dozens of this variety every specimen appeared to be an exact counterpart of the others, and all were of perfectly compact habit. The *Duchess* originally crossed with *Stellata White*, gave the well-known *Fairy Queen*, which in turn produced a beautiful pink form known as *Fairy Queen Pink*.

It is interesting to notice the difference in the type of foliage to be found in these Primulas. *Elaine* is a Fern-leaved variety, but most of them have palmate foliage. There are other differences: certain sorts develop several secondary shoots around the main inflorescence, such as in *Crimson King*, and these make very profuse flowering plants; the inflorescences also vary in height, some of the giant forms, such as *Giant White*, having such tall spikes as to suggest *Stellata* parentage. The tall truss of this variety bears many very large, pure white blossoms and with the side trusses makes a very floriferous specimen. *Holborn Coral* has also a tall inflorescence of the giant type; the name indicates its colour. The Primula nearest approaching a blue shade is *Holborn Blue*, a variety that forms a compact plant with a well-balanced truss of large, lavender-blue pipe.

One of the choicest of the Star Primulas is *Fairy Queen Improved*, with flowers of the *Duchess* type. The whole growth of the plant is exceptionally strong and it is very free-flowering, the blossoms being well set off by the dark-coloured foliage. *Crimson King Improved* is a superior form of the old variety of this name, with much larger flowers of very rich colour.

These are a few of the varieties that especially appealed to us, but there are many others of great merit, including a series of doubles which come perfectly true from seed. *Prince of Wales* and *Princess of Wales* are both exceptionally good in this section.

The Chinese Primulas are still grown in the old range of houses at Forest Hill; the new range contains other plants of interest, and among them a big batch of *P. malacoides*, outstanding varieties of this species being *Princess Mary*, a beautiful mauvy-pink form with bigger flowers than those of *King Albert*, and *Princess Patricia*, a very light and elegant plant bearing beautiful pink blossoms. *P. malacoides Golden Eye*, for which Messrs. Carter's obtained an Award of Merit at the R.H.S. meeting on April 11, 1925, is represented by a fine stock, and just now the plants are in the perfection of beauty.

One of the new plant-houses is almost filled with a collection of seedling *Lachenalias*; others contain *Cinerarias*, greenhouse *Calceolarias* and similar plants which will be included in the firm's exhibits at Chelsea and elsewhere.

## PUBLIC PARKS AND GARDENS.

DAGENHAM Urban District Council has decided to ask the London County Council if it is prepared to hand over to the Council Parsloes Park for use as a public recreation ground.

BLACKPOOL Parks Committee has approved plans for the construction of recreation grounds at the Gynn, Watson's Road and Layton.

MIDDLESEX County Council has received the sanction of the Ministry of Health to borrow £2,607 as a contribution towards the cost of acquiring land in Lampton Road, Hounslow, by the Heston and Isleworth Urban District Council, for a recreation ground.

## VEGETABLE GARDEN.

## SPINACH AND SOME SPINACH SUBSTITUTES.

Most private establishments demand a supply of Spinach, or one of its substitutes, at almost all periods of the year.

Although it is a fairly easy matter to grow these vegetables, hot soils are not suitable for summer production, whilst wet land is inimical to winter cultivation. In both cases steps may be taken to improve these unfavourable conditions.

Spinach is divided into two main sections, summer and winter Spinach. For supplies of the former the round-seeded varieties are used, and the prickly-seeded kinds were invariably used for winter cropping. It has now been established that the round-seeded varieties, which are usually more bulky in leaf, may also be grown successfully in many localities as a winter crop.

Spinach will grow successfully in most kinds of soil provided it is not deficient in lime, but the ground should be worked deeply and receive generous supplies of humus for the summer crop, which is very liable to run to seed prematurely, much depending upon conditions favouring quick growth to bring this crop to perfection.

Spinach is frequently grown as an intercrop between early Peas, and the method of preparing the ground for Peas suits it.

Make the first sowing towards the end of February and continue to sow at fortnightly intervals until about June, or so long as the soil conditions are favourable to its development, choosing a cool situation as the season advances. The rows should be from fifteen inches to eighteen inches apart. Thin the seedlings in the first instance to four inches, and later take out every alternate plant when it has attained a usable size. Constant hoeing and the application of a quick-acting fertiliser, should this be necessary, is the only additional treatment required. Victoria and Long-Standing Round are both good varieties for sowing at this period. To provide pickings from October to May, make two or three sowings from about the beginning of August to the middle of September, according to the locality and requirements. Choice of position and soil are important factors for this crop, for it will not succeed on low-lying, badly-drained ground. If necessary the land should be made up into slightly raised beds. Sow the seeds in drills made twelve inches to fifteen inches apart, and when the plants are large enough, thin them to four or six inches asunder. Where it is possible to rely on the round-seeded varieties, Broad Flanders and Thick-leaved Round will be found suitable. In districts where the round-seeded type is not a success a good stock of Prickly or Winter Spinach should be sown. It is a good plan to choose for the late sowing a variety that is slow in running to seed in the spring, and King of Denmark is excellent.

Other kinds of plants are used as a substitute for the true Spinach, chief amongst these being the Spinach Beet, or Perpetual Spinach as it is frequently called. This is grown in the same way as the ordinary Beet except that the soil should be richer, as in this case it is the leaves that are required. Sow the seeds in April and again in July for later supplies, in rows made fifteen inches to eighteen inches apart, thinning to ten inches from plant to plant. So soon as the leaves are large enough they should be gathered, even if not required for use.

For the hottest part of the year, especially on dry soils, New Zealand Spinach will be found useful, and should revel under these conditions. It is a rather tender plant during its early growth and it is not advisable to sow the seeds in the open before the end of April or early in May. The rows should be three feet apart. Place the seeds in little clumps at intervals of two feet, and thin the seedlings to one in each position. The plant requires a good space in which to develop as it makes many side-growths, often forming a dense carpet. When it is desirable to produce this crop earlier, seeds

may be sown under glass in April and the seedlings planted out when they are hardened suitably.

The young, tender shoots are the parts used. *Chenopodium Bonus-Henricus*, commonly called Good King Henry, is well-known as a Spinach substitute, especially in the cold north-east districts of England. Of perennial habit, it may be raised from seeds, and it grows quite well in fairly good soil in any odd sunny corner of the garden. When once established it requires very little attention beyond keeping the ground free from weeds and top-dressing the plants with rotted manure during the winter. J. Wilson, Wisley.

## HOME CORRESPONDENCE.

**Citrus Fruits at Porlock.**—After the wonderful exhibit of Citrus fruits from La Mortola arranged at the Royal Horticultural Show on Tuesday, January 25, it may interest those who were at the show to know that in our garden at West Porlock House, a few days ago, I ate a sweet Orange from a tree in a tub standing on the flags outside the sitting room window; the Orange was delicious, sweet and juicy. All through this last autumn we have eaten Tangerines picked from trees in tubs standing out-of-doors. I notice they have no pips and are much more strongly scented than those one buys. In the spring we put the Orange trees into a cold house to avoid the worst storms, and there they remain for a month or two. The bitter Oranges we have planted at the foot of the garden walls; several bushes are fruiting and the fruits are colouring well. Last June my cook turned seventy-five of our bitter Oranges into very good marmalade, and again on November 20, I picked thirty-one good fruits which gave us 16 lb of marmalade. We have a Citron trained on the wall, and this is well-set with fruit; there was also a Lemon which did fairly well until a mouse ate the bark near the ground and the tree died. Mrs. G. Blathwayt, West Porlock House, Somerset.

**Virburnum fragrans.**—This delightful shrub, collected by Farrer in China, deserves to be more generally planted. Its flowers, freely produced in the open during January and February, are of a rosy-white hue, and as the name suggests, they are wonderfully fragrant. It has a neat, erect habit, which gives it an attractive appearance during the summer months. *V. fragrans* requires no particular soil or conditions, but undoubtedly prefers the drier part of the garden. S. R. D.

**Promise and Performance.**—Sir William Lawrence's notes (p. 69) are of considerable interest, and underlying them is the basis for certain reforms in the nursery trade; but with the stern competition existing therein, the cutting of prices which results, and the necessity of "making a living out of it," I doubt if it is possible to attain the ideal suggested. Undoubtedly, nurserymen should rely more closely upon the Kew nomenclature, so that their customers may avoid the pitfall of purchasing a plant which they already have, and do not desire to repeat, but which attracts them by appearing under an out-of-the-way synonym. The shrewd hit at the fancy varietal names deserves every attention, for some of these appellations are as far-fetched as can well be imagined. The heights of plants are already given by some nurserymen, but appeal to the writer as being often inefficient, and likely to cause customers more heartburning than if they were omitted, unless used solely for contrast between different batches of the same subject. For example, supposing the tradesman offered plants from six to ten feet high and his customer, owing to a late order, received examples of the small size, would he not probably be more disappointed than if he had not known the probable measurement? Cultural hints and notes as to hardiness, habitat, soils and positions for growing might well be increased in catalogues, to the benefit of the nurseryman who adopts this idea, especially where a plant is regarded as being tender in any locality, but I am afraid that the suggestion of adding

this to the *pro forma* invoice is impossible, for the man in the trade will ask: "Who is going to pay for all this?" In these days of high costs I am afraid the trade would not be able to support the added cost, and the customer would not desire it to be passed on to him. One interested.

**Deep Trenching.**—I desire to express my appreciation of the courteous tenor of your correspondent G. D. (p. 73) in his remarks anent my recent notes on this subject; it is a pleasure to read such a criticism. Particularly do I thank him for drawing attention to a point on which I might have been a little more lucid in the first place. This is with regard to the blanks shown in the picture of the plants on the untrenched ground (Fig. 216, Vol. LXXX). These gaps were, unquestionably caused solely by the lack of attention to the preparation of the ground, necessitated by economic considerations at the moment, for the soil, not being trenched, had a hard pan of clay which collected the water and left the top soil completely waterlogged, with a result that the plants failed to restart after their check during moving, and subsequently died, leaving the vacant spaces shown. The other Broccoli, which were planted only a trifle later, had not this obstacle to their development, for the ground was open and water did not remain near the surface; they made headway and afforded a marked contrast to those on the untrenched area. This pan of clay affects adversely both newly-planted and established plants, because in spells of drought it hardens and prevents the roots going down in search of the necessary moisture at a time when they most need it. I do not preach what I have never practised. Only too well can I recall the labour I experienced in trenching, especially in my youth; and having gained my experience on various soils, such as chalk, sand, gravel, loam and clay, I am the more convinced that it is of enormous benefit to trench to a good depth all kinds of ground, and if your correspondent will only have some of his tenacious red soil broken up and brought to the surface, and compare results then obtained with those on untrenched ground he will, I feel sure, see exactly what I mean. It is a heavy task, I know, but where all the ground cannot be trenched at once, then my plea is for as much to be trenched as can be managed. My first acquaintance with trenching was when, as a youth, working with my father, he insisted on a heavy chalk subsoil being brought to the surface. Despite my boyish groans and protests, this was carried out, and the main reason was his fondness for exhibiting. As an exhibitor, he was admirable, but had not met with the success he desired to attain, especially with root crops, such as Parsnips, with the result that he adopted the deep-trenching method, and from that time he never looked back, but reached the level of success which impressed me with the efficacy of the system. I have nothing to gain in advocating deep trenching, but recommend it for the benefit of the whole community, for I sincerely believe that if carried out in this country as it should be, it would result in an increase of our production by so much as seventy-five per cent., not only in horticulture, but agriculture, for I still urge that this deep working of the soil, whatever its character, is of benefit to practically all forms of plant life in the British Isles. I cannot, of course, locate your correspondent from his initials, but suggest that if he is within reach of Aldenham, or likely to be near here at any time, I should like him to come and see our results, and in addition to the pleasure of meeting him, I should be able to demonstrate the character and disadvantages of our soil and how we cope with them. E. Beckett, Aldenham Gardens, Elstree.

**Salvia virgata nemorosa.**—This *Salvia*, referred to on p. 116, should be much more widely known by gardeners. It is quite hardy and grows to a height of two-and-a-half feet. The flowers are blue, and after the lower bracts have fallen there is quite a distinct purple colour that enhances the effectiveness of the plants. The flowering period is from July to November. This *Salvia* is seen to advantage

ence in the country has recently been published in one of the daily papers at Oslo.

When trees are attacked, a mass of dry twigs and leaves appear in the crown, while the surrounding parts are yet green. The disease then gradually spreads over the whole tree and kills it. In young trees, from fifteen to twenty years old, the process usually takes a few weeks, but in some cases trees may lose their healthy appearance in three days, and the leaves may fall in the course of a week, leaving the tree quite bare. In trees from sixty to eighty years of age the disease spreads more slowly, and death may only take place after the lapse of several years. Such trees bud each year, but the leaf mass is thin and the leaves soon fall. Trees in which the twigs dry up early in the summer may produce fresh shoots, but these, in turn, wither. In winter, diseased trees can be recognised by the curved ends of the small twigs in the crown.

The disease has been found in the nursery where trees of four years and older are attacked. Young plants produced by layering have not been found infected.

In cross section diseased twigs and branches show a ring of brown spots just inside the bark (Fig. 69). These are usually in the outermost annual ring, but in some cases may be found in the second and third ring from the outside. In severely diseased trees, every branch from the thickest to the smallest shows the discoloration of the wood and, in many cases, this may also be seen in the roots. The bark of such trees is almost always riddled by the burrows of bark-beetles.

Almost all species of *Ulmus* appear to be attacked. The disease has been found on *Ulmus campestris latifolia*, *U. c. suberosa*, *U. monumentalis*, *U. hollandica*, *U. nitens* var. *Ruepellii*, *U. americana* and *U. montana*. *U. vegeta* is said to be not attacked in Holland.

Up to the present the cause of the disease has not been definitely determined. No fungal hyphae can be found in the diseased branches, the discoloration being due to the deposition of a dark brown granular substance in the vessels of the wood. Some investigators in Holland believe the disease to be due to the fungus *Graphium ulmi*, which has been obtained along with several other organisms from the diseased branches. Infection experiments with this fungus have, however, all given negative results.

It has also been suggested that the disease is due to physiological causes, especially the dry summer of 1921, and the cold winter of 1923-4, but as the disease is still spreading, this explanation seems inadequate. Recently, Brusoff, working in Germany, has stated that the disease is due to a bacterium, *Micrococcus ulmi*, which he has isolated from diseased trees. He states that he has carried out successful infection experiments with this organism on healthy Elm trees. Within the last year he has stated that the disease also attacks species of *Acer*, *Tilia*, *Populus* and *Fagus*, but he has not performed infection experiments on these trees. Although Brusoff's work does not appear to be altogether satisfactory, and requires confirmation, it is, up to the present, the best explanation that has been given.

As the disease is wide-spread in the four continental countries nearest to Britain, it is possible that, in spite of the prohibition of the importation of Elms, the disease may appear in this country. Any suspicious cases should, therefore, be at once submitted to mycological examination, so that, if the disease proves to be present, steps may be immediately taken to prevent its spread. Owing to its nature the disease is not one that can be easily identified and its presence can only be determined with certainty by a complete and thorough examination of the suspected tree.

In view of its very serious nature the Dutch authorities are now undertaking an extensive investigation of the disease in all its aspects. The block from which the illustration shown in Fig. 69 is taken has been kindly supplied by Miss Dina Spierenburg of the Dutch Phytopathological Service who has already published the results of an important investigation into the disease. *Malcolm Wilson, Mycological Department, University of Edinburgh.*

## NURSERY NOTES.

### PRIMULAS AT FOREST HILL.

IN winter, when the out-door garden is drab and uninviting, a warm greenhouse or conservatory is a great asset, for such a house enables the owner to enjoy the beauty of flowering and foliage plants at a time when they are most appreciated. Probably the two most popular indoor winter-flowering plants in private gardens are Primulas and Cyclamens, for they are serviceable, easily grown and most attractive; of the two the Primula is supreme.

Messrs. James Carter and Co. have long specialised in these beautiful flowers, and they grow large batches of all the best varieties at their nursery at Forest Hill for the special purpose of seed-production.

The Chinese Primula may be used for many purposes, and the modern varieties reach a high standard of perfection. There is a feeling of delight in entering a glasshouse filled with bright plants, such as Primulas, in winter, for, apart from the interest of the plants themselves, there is pleasure in the genial atmosphere and even in the smell of the house, for few flowers are without perfume, and even many foliage plants emit a pleasant odour; those who know the Temperate House at Kew Gardens will remember the peculiar fragrance which always seems to pervade the place, said to be due to the roots of the Acacias grown there.

In the old days *Mimulus moschata*, the Musk, filled the greenhouse with its fragrance, summer and winter, but this plant has lost its sweet perfume and the Musk-laden atmosphere of our plant houses remains only a memory. This is a distinct loss, but modern gardeners have their compensations in the greater wealth of beautiful flowering plants for indoor cultivation in winter, and vastly improved varieties and types over those of old times. The evolution of the stellata type of Primula marked an advance so great that the Star Primulas are preferred by many, because of their lightness and better adaptability for association with other subjects than the giant forms.

Those who wish to see Primulas growing to perfection should visit Messrs. Carter's Forest Hill Nursery in the near future, for the plants have never been more beautiful than they are this season, indeed, so good were they, we asked the manager to give us some details of their cultivation. He informed us that the seeds were sown at the end of May and germinated in a temperature of about 50°. The seedlings were pricked out into boxes and when they were of a suitable size, transferred to sixty-sized pots and kept in cold frames until October. From that date they were potted into forty-eight-sized pots and taken into the glasshouses, which were kept quite cool. As the plants require very careful watering at all stages of their growth, plenty of drainage is necessary, and very porous soil should be used. The compost employed at Forest Hill consisted of three parts loam and one part leaf-mould, mixed with a liberal quantity of old mortar rubble, some sand and rotted manure. If the plants are grown well and kept perfectly hardy they are not likely to be attacked by insect pests, but fly is sometimes troublesome and if this appears the houses should be lightly fumigated, XL ALL being employed at Forest Hill for the purpose.

As Messrs. Carter's plants are grown for seed production, they are not required to flower until the turn of the year, when the days become brighter and the conditions generally more suited to seed-production than in mid-winter. If, however, the plants are required to bloom early, say from November onwards, the seeds should be sown in March and the plants grown on in slightly more heat during October and November. As the latest batches will carry on the succession of blooming until April it is an easy matter to have these Primulas in bloom for six months of the year.

With regard to varieties, it is very difficult to state which would be awarded the Palm, but, in our opinion, it would rest between

*Stellata White* and *Princess May*, which is an old, but still unsurpassed variety, having the largest flowers of its family, of a light coral-pink colour set off by beautiful, light green foliage, and borne in big trusses on strong stems; some of the individual flowers measure so much as two-and-a-half inches across. The *Duchess*, which is one of the most distinct of all Primulas, is represented at Forest Hill by an improved strain with very big flowers. It was interesting to note that of the many dozens of this variety every specimen appeared to be an exact counterpart of the others, and all were of perfectly compact habit. The *Duchess* originally crossed with *Stellata White*, gave the well-known *Fairy Queen*, which in turn produced a beautiful pink form known as *Fairy Queen Pink*.

It is interesting to notice the difference in the type of foliage to be found in these Primulas. *Elaine* is a Fern-leaved variety, but most of them have palmate foliage. There are other differences: certain sorts develop several secondary shoots around the main inflorescence, such as in *Crimson King*, and these make very profuse flowering plants; the inflorescences also vary in height, some of the giant forms, such as *Giant White*, having such tall spikes as to suggest *Stellata* parentage. The tall truss of this variety bears many very large, pure white blossoms and with the side trusses makes a very floriferous specimen. *Holborn Coral* has also a tall inflorescence of the giant type; the name indicates its colour. The Primula nearest approaching a blue shade is *Holborn Blue*, a variety that forms a compact plant with a well-balanced truss of large, lavender-blue pips.

One of the choicest of the Star Primulas is *Fairy Queen Improved*, with flowers of the *Duchess* type. The whole growth of the plant is exceptionally strong and it is very free-flowering, the blossoms being well set off by the dark-coloured foliage. *Crimson King Improved* is a superior form of the old variety of this name, with much larger flowers of very rich colour.

These are a few of the varieties that especially appealed to us, but there are many others of great merit, including a series of doubles which come perfectly true from seed. *Prince of Wales* and *Princess of Wales* are both exceptionally good in this section.

The Chinese Primulas are still grown in the old range of houses at Forest Hill; the new range contains other plants of interest, and among them a big batch of *P. malacoides*, outstanding varieties of this species being *Princess Mary*, a beautiful mauvy-pink form with bigger flowers than those of *King Albert*, and *Princess Patricia*, a very light and elegant plant bearing beautiful pink blossoms. *P. malacoides Golden Eye*, for which Messrs. Carter's obtained an Award of Merit at the R.H.S. meeting on April 11, 1925, is represented by a fine stock, and just now the plants are in the perfection of beauty.

One of the new plant-houses is almost filled with a collection of seedling *Lachenalias*; others contain *Cinerarias*, greenhouse *Calceolarias* and similar plants which will be included in the firm's exhibits at Chelsea and elsewhere.

## PUBLIC PARKS AND GARDENS.

DAGENHAM Urban District Council has decided to ask the London County Council if it is prepared to hand over to the Council *Paraloes Park* for use as a public recreation ground.

BLACKPOOL Parks Committee has approved plans for the construction of recreation grounds at the Gynn, Watson's Road and Layton.

MIDDLESEX County Council has received the sanction of the Ministry of Health to borrow £2,607 as a contribution towards the cost of acquiring land in Lampton Road, Hounslow, by the Heston and Isleworth Urban District Council, for a recreation ground.

## VEGETABLE GARDEN.

## SPINACH AND SOME SPINACH SUBSTITUTES.

Most private establishments demand a supply of Spinach, or one of its substitutes, at almost all periods of the year.

Although it is a fairly easy matter to grow these vegetables, hot soils are not suitable for summer production, whilst wet land is inimical to winter cultivation. In both cases steps may be taken to improve these unfavourable conditions.

Spinach is divided into two main sections, summer and winter Spinach. For supplies of the former the round-seeded varieties are used, and the prickly-seeded kinds were invariably used for winter cropping. It has now been established that the round-seeded varieties, which are usually more bulky in leaf, may also be grown successfully in many localities as a winter crop.

Spinach will grow successfully in most kinds of soil provided it is not deficient in lime, but the ground should be worked deeply and receive generous supplies of humus for the summer crop, which is very liable to run to seed prematurely, much depending upon conditions favouring quick growth to bring this crop to perfection.

Spinach is frequently grown as an intercrop between early Peas, and the method of preparing the ground for Peas suits it.

Make the first sowing towards the end of February and continue to sow at fortnightly intervals until about June, or so long as the soil conditions are favourable to its development, choosing a cool situation as the season advances. The rows should be from fifteen inches to eighteen inches apart. Thin the seedlings in the first instance to four inches, and later take out every alternate plant when it has attained a usable size. Constant hoeing and the application of a quick-acting fertiliser, should this be necessary, is the only additional treatment required. Victoria and Long-Standing Round are both good varieties for sowing at this period. To provide pickings from October to May, make two or three sowings from about the beginning of August to the middle of September, according to the locality and requirements. Choice of position and soil are important factors for this crop, for it will not succeed on low-lying, badly-drained ground. If necessary the land should be made up into slightly raised beds. Sow the seeds in drills made twelve inches to fifteen inches apart, and when the plants are large enough, thin them to four or six inches asunder. Where it is possible to rely on the round-seeded varieties, Broad Flanders and Thick-leaved Round will be found suitable. In districts where the round-seeded type is not a success a good stock of Prickly or Winter Spinach should be sown. It is a good plan to choose for the late sowing a variety that is slow in running to seed in the spring, and King of Denmark is excellent.

Other kinds of plants are used as a substitute for the true Spinach, chief amongst these being the Spinach Beet, or Perpetual Spinach as it is frequently called. This is grown in the same way as the ordinary Beet except that the soil should be richer, as in this case it is the leaves that are required. Sow the seeds in April and again in July for later supplies, in rows made fifteen inches to eighteen inches apart, thinning to ten inches from plant to plant. So soon as the leaves are large enough they should be gathered, even if not required for use.

For the hottest part of the year, especially on dry soils, New Zealand Spinach will be found useful, and should be sown under these conditions. It is a rather tender plant during its early growth and it is not advisable to sow the seeds in the open before the end of April or early in May. The rows should be three feet apart. Place the seeds in little clumps at intervals of two feet, and thin the seedlings to one in each position. The plant requires a good space in which to develop as it makes many side-growths, often forming a dense carpet. When it is desirable to produce this crop earlier, seeds

may be sown under glass in April and the seedlings planted out when they are hardened suitably.

The young, tender shoots are the parts used. *Chenopodium Bonus-Henricus*, commonly called Good King Henry, is well-known as a Spinach substitute, especially in the cold north-east districts of England. Of perennial habit, it may be raised from seeds, and it grows quite well in fairly good soil in any odd sunny corner of the garden. When once established it requires very little attention beyond keeping the ground free from weeds and top-dressing the plants with rotted manure during the winter. J. Wilson, Wisley.

## HOME CORRESPONDENCE.

**Citrus Fruits at Porlock.**—After the wonderful exhibit of Citrus fruits from La Mortola arranged at the Royal Horticultural Show on Tuesday, January 25, it may interest those who were at the show to know that in our garden at West Porlock House, a few days ago, I ate a sweet Orange from a tree in a tub standing on the flags outside the sitting room window; the Orange was delicious, sweet and juicy. Cultural hints and notes as to hardiness, habitat, soils and positions for growing might well be increased in catalogues, to the benefit of the nurseryman who adopts this idea, especially where a plant is regarded as being tender in any locality, but I am afraid that the suggestion of adding

this to the *pro forma* invoice is impossible, for the man in the trade will ask: "Who is going to pay for all this?" In these days of high costs I am afraid the trade would not be able to support the added cost, and the customer would not desire it to be passed on to him. One interested.

**Deep Trenching.**—I desire to express my appreciation of the courteous tenor of your correspondent G. D. (p. 73) in his remarks anent my recent notes on this subject; it is a pleasure to read such a criticism. Particularly do I thank him for drawing attention to a point on which I might have been a little more lucid in the first place. This is with regard to the blanks shown in the picture of the plants on the untrenched ground (Fig. 216, Vol. LXXX). These gaps were, unquestionably caused solely by the lack of attention to the preparation of the ground, necessitated by economic considerations at the moment, for the soil, not being trenched, had a hard pan of clay which collected the water and left the top soil completely water-logged, with a result that the plants failed to restart after their check during moving, and subsequently died, leaving the vacant spaces shown. The other Broccoli, which were planted only a trifle later, had not this obstacle to their development, for the ground was open and water did not remain near the surface; they made headway and afforded a marked contrast to those on the untrenched area. This pan of clay affects adversely both newly-planted and established plants, because in spells of drought it hardens and prevents the roots going down in search of the necessary moisture at a time when they most need it. I do not preach what I have never practised. Only too well can I recall the labour I experienced in trenching, especially in my youth; and having gained my experience on various soils, such as chalk, sand, gravel, loam and clay, I am the more convinced that it is of enormous benefit to trench to a good depth all kinds of ground, and if your correspondent will only have some of his tenacious red soil broken up and brought to the surface, and compare results then obtained with those on untrenched ground he will, I feel sure, see exactly what I mean. It is a heavy task, I know, but where all the ground cannot be trenched at once, then my plea is for as much to be trenched as can be managed. My first acquaintance with trenching was when, as a youth, working with my father, he insisted on a heavy chalk subsoil being brought to the surface. Despite my boyish groans and protests, this was carried out, and the main reason was his fondness for exhibiting. As an exhibitor, he was admirable, but had not met with the success he desired to attain, especially with root crops, such as Parsnips, with the result that he adopted the deep-trenching method, and from that time he never looked back, but reached the level of success which impressed me with the efficacy of the system. I have nothing to gain in advocating deep trenching, but recommend it for the benefit of the whole community, for I sincerely believe that if carried out in this country as it should be, it would result in an increase of our production by so much as seventy-five per cent., not only in horticulture, but agriculture, for I still urge that this deep working of the soil, whatever its character, is of benefit to practically all forms of plant life in the British Isles. I cannot, of course, locate your correspondent from his initials, but suggest that if he is within reach of Aldenham, or likely to be near here at any time, I should like him to come and see our results, and in addition to the pleasure of meeting him, I should be able to demonstrate the character and disadvantages of our soil and how we cope with them. E. Beckett, Aldenham Gardens, Elstree.

**Salvia virgata nemorosa.**—This *Salvia*, referred to on p. 115, should be much more widely known by gardeners. It is quite hardy and grows to a height of two-and-a-half feet. The flowers are blue, and after the lower bracts have fallen there is quite a distinct purple colour that enhances the effectiveness of the plants. The flowering period is from July to November. This *Salvia* is seen to advantage

when planted two feet apart in large beds. Cuttings that were propagated last August are now ready for potting into 60's, and this work is being carried out now, there being a batch of three thousand to pot. Our largest bed is a round one, forty-eight feet in diameter, and all last season was a blaze of colour and greatly admired by those who saw it. Goodwood and Lowther Castle are the only other two places which I know where *Salvia virgata nemorosa* is grown by the thousand, and I feel sure Mr. Jeffery, of Lowther Castle Gardens, agrees with me that *Salvia virgata nemorosa* makes a grand display. *Arthur Allardice, Burwarton Hall Gardens, Bridgnorth.*

#### The Destruction of Rats with Calcium Cyanide.

—I was interested to read in one of the late issues of *The Gardeners' Chronicle* how to destroy rats with calcium cyanide. It is very easy indeed to get rid of these pests. In one corner of the pleasure grounds here we have a lot of old soil, tree stumps and rock, where a great number of rat holes exist. I placed two tablespoonfuls of the cyanide in different holes filling the rest in and treading all firmly. The holes in which the cyanide was placed were also filled in. I advise this to be done on a calm day. I observed that when the ground was covered with snow for three days not one hole had been opened by the rats and no traces of them have been seen, so I think we have effectually destroyed the pests. *G. Moore, Brackenburgh Tower Gardens, Carlisle.*

**Lathyrus tuberosus.**—Mr. Briscoe gives an interesting account of the above wild plant in *The Gardeners' Chronicle* of January 22. He seeks information as to whether it has been found in other parts of the country than Essex, and states that it was found growing wild last season in a field near Ledbury Park, Cheptow, and staged at a local show in a collection of wild flowers. This plant is pretty well known through the Wye Valley, around Monmouth and the Forest of Dean, and I have seen it exhibited at many local shows in children's classes of wild flowers. As Mr. Briscoe suggests introducing it into the garden, I may state that I have had experience in this matter, but found it very difficult to establish. If an attempt is made, the roots should be marked when found and moved when growth is completed, otherwise a good turf should be taken up, keeping the roots intact. *L. tuberosus* is certainly all that Mr. Briscoe considers it, and there is no reason why good use should not be made of it for hybridising purposes. Another plant that grows wild around the above-mentioned district is *Saponaria officinalis*, both in single and double form; this is an ideal subject for the wild and woodland gardens. *W. E. Wright, Tregarth Gardens, Creigiau, Near Cardiff.*

#### Buddleia Forrestii and B. Fallowiana.

The thanks of the shrub-loving section of the horticultural world are due to *The Gardeners' Chronicle* for having through its columns, by the publication of letters and illustration, indicated the widespread confusion of these two plants, and it is to be hoped that all distributors will take note that the plant they have been sending out as *B. Forrestii* is henceforth to be known as *B. Fallowiana*. The original plant in our collection was received from the Royal Horticultural Society's garden at Wisley several years ago as part of their annual distribution of surplus plants, and the probability is, that from this source alone, many hundreds of the erroneously-named plant have found their way into the widely-scattered gardens of Fellows, who would never for a moment doubt the correctness of any name supplied from these famous gardens. If this should be the case, it might be advisable to insert a correction in the next issue of the R.H.S.'s *Journal*, as by so doing, a great number of the recipients of the wrongly named plants would be reached. Personally, I was delighted to see the splendid reproduction of this plant in Vol. LXXX, page 489, and recognised at a glance the woolly leaves and branching habit of the plant, as it flowered here the previous autumn, and which had already found a hearty welcome under the name of *B. Forrestii*. *A. T. Harrison, Culzean Castle Gardens.*

## SOCIETIES.

### GUILDFORD CHRYSANTHEMUM.

At the annual meeting of this Society, held on Monday, January 24, Mr. F. W. Westlake presided in the unavoidable absence of the President, Alderman F. F. Smallpeice.

The annual report, presented by the Secretary, Mr. W. J. Miles, stated that the thirty-fourth annual exhibition held in November last, was not quite up to the previous standard in regard to the number of exhibits, the decline being in the fruit classes and due to the poor season.

The statement of accounts, presented by Alderman W. T. Patrick, showed total receipts, including the balance brought forward, of £255 7s. 4d.; expenditure, £151 4s. 1d., leaving a credit balance of £104 3s. 3d.

Alderman Smallpeice was re-elected President, and Messrs. Patrick, Miles and A. H. Olds, re-elected to the respective offices of Treasurer, Secretary and Auditor. Owing to the death of Mr. G. J. Nichols, there was a vacancy on the Committee to which Mr. Lampard of Holmbury-St.-Mary was elected. The other members were re-elected.

### MANCHESTER AND NORTH OF ENGLAND ORCHID.

THURSDAY, FEBRUARY 3, 1927.—*Committee present:* Mr. J. B. Adamson (in the chair), Mr. R. Ashworth, Mr. C. Branch, Mr. A. Burns, Mr. A. Coningsby, Mr. D. A. Cowan, Mr. J. Cypher, Mr. J. Evans, Mr. A. Keeling, Mr. D. Losh-Thorpe, Mr. D. McLeod and Mr. H. Arthur (Secretary).

#### FIRST CLASS CERTIFICATES.

*Brasso-Laelio-Cattleya Amber var. G. V. Llewelyn (B.-L.-C. The Baroness × C. aurea).*—A fine flower with rich yellow sepals and petals; lip rose-lilac with yellow marks.

*Cattleya Clotho var. G. V. Llewelyn (Enid superba × Trianae Edgar Knight).*—Flower of perfect shape, broad, deep mauve sepals, with a stripe of reddish-purple at the tips; large lip, reddish purple. Both these were from G. V. LLEWELYN, Esq.

*Odontoglossum Crispum-Solon var. Prince Albert.*—A flower of perfect shape; all the segments are heavily blotched with reddish-brown, with white margins; lip flat, white at the base. From J. B. ADAMSON, Esq.

*Cypripedium Christo-biades (Christopher Grand Duke Nicholas × Eurybiades).*—A large flower of Christopher type, dorsal sepal white with green base, heavily spotted in the centre with reddish-purple spots. From S. GRATRIX, Esq.

#### AWARDS OF MERIT.

*Odontoglossum L'Aiglon var. Tracery, Odontoglossum Dryad, and Brasso-Cattleya var. Mrs. Ernest Wood.*—From G. V. LLEWELYN, Esq.

*Odontioda Joiceyi var. Royal George.*—From J. B. ADAMSON, Esq.

#### CULTURAL CERTIFICATES.

To Mr. C. BRANCH, for *Odontioda var. Viscount Lascelles*, and to Mr. A. BURNS, for *Platyclinis uncata*.

#### GROUPS.

J. B. ADAMSON, Esq., Blackpool (gr. Mr. J. Howes), staged a group to which a Gold Medal was awarded. *Odontoglossums* included *O. Crispum-Solon var. Prince Albert*, *O. L'Aiglon var. Tracery*, *O. Dryad* and *O. crispum Baron Renfrew*; *Odontioda Joiceyi var. Royal George*, *O. Chanticleer* and *O. Beryl var. Margaret*; *Cypripediums* and *Cattleyas* in variety were also shown.

S. GRATRIX, Esq., West Point (gr. Mr. C. Branch), was also awarded a Gold Medal for a group that contained *Cypripediums* in great variety, including *C. Robert Paterson*; *Odontoglossum ardentissimum McBean's var.*, *O. Tharo*, *O. Arabic*, *O. Llewelyn* and plants of the *O. crispum* section, besides many good *Odontiodas*.

Mrs. BRUCE and Miss WRIGLEY, Bury (gr.

Mr. A. Burns), staged a group to which a Large Silver-gilt Medal was awarded. This included a fine batch of *Laelia Gouldiana*, and several well-flowered examples of *Platychinis uncata*. G. V. LLEWELYN, Esq., Southport, staged *Cattleya Clotho var. G. V. Llewelyn*, *B.-L.-C. Amber var. G. V. Llewelyn*, *B.-C. British Queen var. Mrs. Ernest Wood* and *Cypripedium Curtisii exquisitum*.

Messrs. J. CYPHER and SONS, Cheltenham, were awarded a Silver-gilt Medal for a group containing *Cypripedium Alabaster*, *C. Ballet Girl*, *C. Cupid*, *C. Bridgei* and *C. insigne var. Snow Queen*; *Cymbidium Albatross*, *C. Alexanderi* and *C. eburneo-Lowianum*; *Dendrobium Juno*, *D. Ainsworthii*, *D. aureum*, *D. Cassiope* and *D. nobile*. Messrs. A. J. KEELING and SONS, Bradford, staged *Cypripediums*, and Mrs. JOHN EVANS, Colwyn Bay, exhibited *Cypripedium Memoria F. M. Ogilvie var. The King*.

### ORCHID CLUB.

At the meeting of the Orchid Club, held on the 11th inst., *Dendrobiums*, *Cymbidiums* and *Lycastes* were fine features in some beautiful groups. The well-flowered plants of *Dendrobium Tyntesfield*, shown by Mrs. FRED HARDY, were greatly admired.

#### DIPLOMAS OF MERIT.

*Dendrobium Discus (D. Tyntesfield × D. Cybele).*—A large flower of perfect shape; the broad sepals and petals are white at the base, the outer half being bright crimson. The large open lip has a rich, velvety maroon mask and a marginal white band, the tip being crimson. A new seedling of great promise and free-flowering, the beautiful flowers being well displayed by the erect habit of the trusses. From Dr. CRAVEN MOORE.

*Odontoglossum crispum var. Cedric.*—A hybrid white crispum having flowers three-and-a-half inches across, of perfect shape and good habit, the only colour being some crimson spots on the lip. From Dr. CRAVEN MOORE.

*Odontoglossum Pyramus var. Conyngham.*—A well-shaped flower, three-and-a-quarter inches across; the sepals and petals are bright crimson-red, slightly broken with white, the lip being flat, well-displayed, white with crimson blotches. From Dr. CRAVEN MOORE.

#### CERTIFICATE OF CULTURAL COMMENDATION.

To *Haemaria discolor*.—A beautiful plant in a ten-inch pan, carrying twenty-three full spikes of white flowers. From B. T. BECKTON, Esq.

#### GROUPS.

B. J. BECKTON, Esq. (gr. Mr. Stewart), exhibited a large group containing some twenty *Cypripediums* of fine quality and merit, of which the exquisitely-coloured *C. Fairville*, *C. Caracacus var. Paraseve*, *C. Hermeville* and *C. The Chairman*, were especially good. The remaining forty plants included several good varieties of *Lycaste Skinneri*, and a wide selection of interesting and beautiful species, among which the unique plant of *Haemaria discolor* and fine types of *Sophranitis grandiflora*, *Masdevallias* and *Miltonia* were conspicuous.

Mrs. FRED HARDY exhibited six large, freely-flowered plants of the beautiful *Dendrobium Tyntesfield (D. nobile Hardyana × t.)*. A. T. CUSSENS, Esq. (gr. Mr. Dalgleish), staged a group in which *Cypripediums* and *Cymbidiums* were conspicuous, *Cymbidium Schlegelii var. Kervall*, and *C. Pauwelsii* being in beautiful form.

Dr. CRAVEN MOORE (gr. Mr. Golden), exhibited a large group of fine *Odontoglossums* and *Cymbidiums*. Of the former there were many fine varieties of *O. armainvillierense xanthotes*, and *xanthotic crispums*; with hybrid crispums of fine quality, and among the coloured hybrids, excellent forms of *O. Dietune*, *O. Marathon*, *O. Pyramus* and *O. Migueleto*. The *Cymbidiums* included *C. Castor var. The King*, *C. Coningsblanum*, of exceptional merit, and a fine variety of *C. albanense*. Two fine plants of *Dendrobium Lady Colman* and two of the new *Dendrobium Discus* were included in the group.

Mrs. STOCKWELL (gr. Mr. Weaver), exhibited a small group of *Cypripediums* and *Odontoglossums*, including *C. Alcibiades*, *C. Vashti*, *C. Maudiae* and *C. Maudiae coloratum*, and *O. Gladys* var. *Conyngham*—a specially fine form of this pretty *O. cirrhosum* hybrid; and some good white forms of *O. crispum*. F. T. PAUL, Esq., showed some beautiful flowers of *Laelio-Cattleya Schroderae*, *Brasso-Cattleya Thorntonii*, and various *Cypripediums*, including *C. Lady Evelyn James*, *C. Leyburnense* and seedlings.

### ROYAL GARDENERS' ORPHAN FUND.

THE Annual General Meeting of the subscribers of this horticultural charity was held on Wednesday last at Simpson's Restaurant, Strand, Mr. David Ingamells, Chairman of Committee, presided, and others present were Mr. J. F. McLeod, Mr. Peter R. Barr, Mr. John Gregory, Mr. Geo. F. Tinley, Mr. W. Howe, Mr. R. B. Leech, Mr. C. H. Curtis, Mr. D. Swain, Mr. John Cull, Mr. J. N. Bridgeford, Mr. D. Campbell, Mr. A. Dawkins and Mr. J. Linford.

After the Secretary had read the notice convening the meeting, and the minutes of the last annual meeting had been read and signed, the annual report of the committee for 1926 was submitted to the meeting.

### EXTRACTS FROM THE REPORT OF THE EXECUTIVE COMMITTEE.

In presenting their thirty-ninth Annual Report, your committee tender grateful thanks to all the subscribers for their continued support which enables them to extend relief to the orphan children of gardeners and others in allied callings, who have met with the great misfortune of losing their fathers. Your committee has been enabled, through this generous support, to grant extended allowances for several children whose work at school has shown great promise. Many of these children have won scholarships, and your Committee feel that the further education thus obtained will be of great value to the children and to the country generally in fitting them for their work later in life. In these instances the headmasters of the schools have given their pupils excellent reports.

In view of the greatly reduced purchasing value of money, your Committee has, for some years past, desired to recommend an increase in the amounts of the weekly allowances made to the children. A special sub-committee most carefully investigated the matter, but regretfully reported that the available income of the Fund was not sufficient to enable them to recommend any increase at present.

The total income of the Fund, from all sources, during the past year amounted to £3,807 6s. In continuance of its financial policy, your Committee has made a further contribution towards restoring the Invested Funds to their pre-war position.

The Annual Festival Dinner, which was held at the Hotel Victoria on July 14 last, was again the means of very materially augmenting the Fund's income. Your Committee would offer the Fund's sincere thanks to Mr. George J. Nicholls, C.C., F.R.C.I., who kindly presided and worked wholeheartedly for the success of the Dinner. In addition to devoting a deal of valuable time to the arrangements, Mr. Nicholls generously made a gift of sufficient shares in his business to form a fund to provide for one orphan in perpetuity.

Your Committee are most pleased to be able to report that Sir Henry Whitehead, of Stagenoe Park, Welwyn, has kindly promised to preside at the next Dinner, which has been arranged for May 20, 1927.

Your Committee again wish to acknowledge, with heartfelt thanks, the valued contributions from gardening associations during the past year.

Considerable amounts were also collected by Mr. W. Auton, Pyrford Court Gardens, Woking; Mr. T. H. Cook of the Royal Gardens, Sandringham; Mr. Joseph Lytle, Garden Supplies Co., Liverpool; Mr. T. Pateman, Brocket Hall Gardens, Hatfield; Mr. Wm. Rowe, Squerres Court Gardens, Westerham; Mr. P. O. Knowles, Head Gardener to Sir Percival Victor, Bt., at Friar Park, Henley-on-Thames; Mr. C. Nippard, Bournemouth; Mr. A. H. Fulker, Reading; Mr. Wm. Austin (of Glasgow), Harrogate; Messrs. Wm. Thomson and Sons, Clovenfords, and the Rev. A. Lowe, Rangemore Vicarage, Burton-on-Trent, chiefly by means of concerts and other entertainments. Your Committee desire to record their great appreciation of the work thus done on behalf of the Fund.

It is with deep regret that your Committee have to record the loss the Fund has sustained, during the past year, by the deaths of valued supporters of the Fund. Mr. T. W. Sanders, late Editor of *Amateur Gardening*, and Mr. G. Reynolds, of Gunnersbury Park Gardens, were for many years, until medical reasons compelled their retirement, regular in their attendance at committee meetings and untiring in their efforts for the Fund. Through the deaths of Mr. F. W. Curry and Mr. T. H. Windle, the Fund has also lost valued supporters, and your Committee express their deep sympathy with the relatives.

The members of the Committee who retire by rotation are Messrs. D. Ingamells, R. B. Leech, J. F. McLeod, A. W. Metcalfe, T. Pateman, D. Swain, G. F. Tinley and John Wort, who, being eligible, offer themselves for re-election. For the vacancy caused by the death of Mr. G. Reynolds your Committee wish to nominate Mr. W. G. Penton, of Warren House Gardens, Kingston Hill, Surrey.

The Chairman, in moving the adoption of the report, stated it was so very full of information that it left little for him to say, but he would

like to offer the thanks of the Committee publicly to all who have supported the Fund during the past year. The adoption of the report was seconded by Mr. C. H. Curtis, who stated the report paid a happy tribute to the many friends who had helped the Fund during the past twelve months, and he hoped the example of those who had assisted by holding concerts, etc., would be copied by others, for it was one of the best means by which gardeners and others living in quiet, country places could render assistance. Although all were pleased to know that there were so few orphans forthcoming, he thought this was one of the reasons why the Fund had suffered in loss of income, but he had no doubt that when there were more orphans there would be more support. The report was adopted without further comment.

Mr. Peter R. Barr presented the cash statement for 1926. He stated that the accounts had been very carefully audited by Mr. Witty and himself and he complimented the Secretary on the manner in which the books were kept. He stated that subscriptions, including those from local secretaries, amounted to £288 10s. 8d.; donations (general) to £289 18s. 6d., and donations from local secretaries, £48 14s. 6d., making a total of £338 13s. 0d. The proceeds of the annual festival dinner amounted to £440 3s. 2d., whilst the revenue from advertisements was £14 5s. 6d., and dividends came to £467 15s. 9d. These sums, together with a balance from the last account amounted to £3,807 6s. 0d. Payments included children's allowances, £894 10s., which, together with various grants, involved total payments to the orphans of £956 7s. 6d.; the Secretary's salary amounted to £195 16s. 8d.; rent, insurance, firing, etc., £78 14s. 1d.; printing and stationery, £57 1s. 0d.; and printing and posting list of subscribers, £61 6s. 8d. These amounts, with other small sums, made total payments of £1,380 4s. 0d. Mr. Barr said the Fund had purchased five per cent. War Stock at a cost of £1,515 4s. 0d., and the cash at the bank, on deposit and in hand, amounted to £911 18s. 0d. A considerable amount of the balance was required to meet payment of the children's allowances on the 1st January. Mr. Barr stated that the receipts were down last year in comparison with 1925, for there was a reduction in the donations, and the proceeds of the annual dinner. The cost of printing had also increased. On the other hand, payments to the children, including grants, were down, and the cost of the postages also was lower.

Mr. Cull asked for the reason of the rather heavy payments for printing the List of Subscribers and for the printing generally; he was informed that the printing had been done for the annual dinner, when the latter had to be cancelled owing to the strike, and the printing had all to be done again. The Secretary also stated that the printing included a new register book, which lasted five years, and posters which were to be used for advertising the Fund, both of which expenses would not be recurring.

On the motion of Mr. McLeod it was proposed to send a hearty vote of thanks to Mr. George J. Nicholls for presiding at the annual festival dinner, and Mr. Nicholls was elected a Vice-President of the Fund.

Mr. Edward Sherwood was re-elected Hon. Treasurer, and the retiring members of Committee, Messrs. D. Ingamells, R. B. Leech, J. F. McLeod, A. W. Metcalfe, T. Pateman, D. Swain, G. F. Tinley and John Wort, were all re-elected, and Mr. W. G. Penton, Warren House Gardens, Kingston Hill, Surrey, was elected to the vacancy caused by the death of Mr. G. Reynolds. The retiring Auditor, Mr. Peter R. Barr, was re-elected, and thanked, for his services.

On the motion of the Chairman, Mr. A. C. Bartlett was re-elected Secretary of the Fund. Mr. Ingamells stated that Mr. Bartlett had carried out his duties to the satisfaction of himself and the Committee, and he had much pleasure in proposing his re-election. The motion was seconded by Mr. McLeod and carried unanimously. The next business of the meeting was the election of orphans, and there being no necessity for a poll, three candidates, approved

by the Committee, were elected by resolution. They were Barbara Malcolm Macnaughton, aged eight months, daughter of Malcolm MacNaughton, late gardener to the Earl of Mansfield, Scone Palace, Perth, who died on March 1, 1926; Peggy Ruth Vert, aged ten years and two months, daughter of Frederick John Vert, late nursery foreman to Messrs. James Vert and Sons, Saffron Walden, and Peter Charles Vert, aged seven years and one month, brother of the last.

The Chairman stated that he had a distressing case brought to his notice that morning; a gardener's two young children who had been deprived of both parents on the same day. The father was Mr. G. F. Waller, gardener at The Syen, Hayling Island, Havant, Hampshire; both Mr. Waller and his wife died on February 8, the day after Mr. Waller's father was buried. The two children are aged sixteen months and four-and-a-half years, respectively.

Mr. Leech proposed that "this Annual General Meeting, having heard the available particulars concerning Dorothy Eileen Waller and George Waller, orphan children of the late Mr. G. F. Waller, lately head gardener to The Syen, Hayling Island, Havant, Hampshire, do hereby authorise the Executive Committee to deal with applications concerning the children as they may see fit." The motion was seconded by Mr. C. H. Curtis and carried unanimously.

The Chairman stated that if the children were eligible for the benefits of the Fund the Committee would do the utmost it could to help them.

A vote of thanks to the Chairman, proposed by Mr. Barr, brought the proceedings to a close.

### WATFORD HORTICULTURAL.

THE first meeting of the Watford Horticultural Society since its enlargement was held at the Council Chamber on Monday, January 31. Mr. Armand Blackley (Chairman of the Bushey, Bushey Heath and District Horticultural Society) presided.

Mr. W. E. Cheeseman (Hon. Secretary) said that the present meeting was the outcome of a meeting held in November last, when a committee was elected to formulate an enlarged society. That committee met on November 19 and December 4, and, as a result, a sub-committee formulated plans for an enlarged society. Then the question of finance arose. He was glad to say that in that direction they had met with a fair amount of success; the *Watford Observer* had offered a silver challenge cup and also a replica to be won each year; also, through the good offices of Mr. F. E. Steward, Mr. Pierpont Morgan had offered a donation of £25 and a challenge cup worth £20; Colonel V. Lane, of Berkhamsted, had offered a cup worth £20 and a silver and a bronze medal. They had also received a letter from Miss E. E. R. Bradford, wishing the Society success, and enclosing a cheque for two guineas, which she hoped to double as a regular subscription.

Lord Clarendon, who had intimated his willingness to remain as President, was unanimously elected to that office.

Mr. W. E. Cheeseman was elected Hon. Secretary, and Mr. Fowler, Hon. Treasurer, after Mr. E. S. Theobald, who has held that position since 1911, had intimated his desire to retire.

It was decided to have a committee of twenty-five with power to co-opt. It was decided to ask the Borough Treasurer to become Hon. Auditor.

The Hon. Secretary read the appeal proposed to be circulated, and it was approved. The appeal asks for a sum of £1,000 for a prize list, expenses, etc.

It was decided to recommend the committee to hold a show in September of this year, and to leave it to the committee to decide whether a summer outdoor show or an autumn indoor show should be held.

At a subsequent meeting of the committee it was decided to hold a show in Cassiobury Park, on Tuesday and Wednesday, July 26 and 27.

## ASSOCIATION OF ECONOMIC BIOLOGISTS.

THE annual general meeting of this Association was held at the Imperial College of Science on January 28. After the business of the meeting was concluded the following demonstrations and exhibits of biological interest were shown:—Insects intercepted in miscellaneous imports, by Mr. J. C. Fryer; Intermediates in the Bean Aphis, by Dr. J. Davidson; Long-horn beetles, pin-hole borers, powder-dust beetles and furniture beetles, by The Forest Products Research Laboratory; An unusual form of parasitism of an Anthomyid Fly, by Dr. K. M. Smith; A specimen of Potato tubers arising on true roots, and specimens of the progeny from such root tubers, by Mr. W. A. Roach; Cochineal insects and plants, Camphor wood and products, Lac and lac insects, from the Royal Botanic Gardens, Kew; the physiology and genetics of Smut-Fungi, by Mr. S. Dickinson; infection of immune varieties of Potatoes by *Synchytrium endobioticum*, by Miss M. D. Glynne; Some cultures of *Armillaria mellea*, by Mr. K. St. G. Cartwright; Damage done by *Collemboles*, by Dr. A. D. Imms and Mr. W. M. Davies; Cultures of Tropical Fungi, by the Imperial Bureau of Mycology; and *Pyrethrum* grown in England, by Mr. R. Stenton.

## GLASGOW AND WEST OF SCOTLAND.

MR. JOSEPH DOBSON presided over a largely attended meeting of the Glasgow and West of Scotland Horticultural Society on Wednesday, the 9th inst., when Mr. John Highgate, Dankeith, Kilmarnock, delivered a lecture on "Herbaceous Plants." Mr. Highgate dealt with his subject in a comprehensive and able manner.

## Obituary.

**John Horton.**—At the advanced age of eighty-three years, Mr. John Horton, of Woodend, Cuckney, passed away on Sunday, February 6. Mr. Horton was employed for many years on the Duke of Portland's estate at Welbeck, where he held the position of outside foreman until in 1887, on the death of Mr. Carr, he was appointed gardener. He retired in 1897 and went to live at Woodend. He will be remembered by many gardeners who obtained part of their experience at Welbeck, and these, in addition to many friends, will deeply regret the loss his family of five daughters has sustained.

**Dr. Müller-Thurgau.**—We regret to learn of the death, at the age of seventy-seven, on the 18th January, of Dr. Müller-Thurgau, the Director for many years of the German-Swiss Experimental Station at Wädenswil, in Switzerland. The institution was created in 1890, and served also as a college for the study of fruit and vine-growing and gardening. In 1925, Dr. Müller-Thurgau retired from active Direction of the Station, but retained his interest in it and acted still as "Working Director." He retained all his faculties to the last, and, as his father had lived to a great age, Dr. Müller-Thurgau's sudden death came as a great shock to his many friends and to the students, both past and present, who had passed through his hands.

**Mrs. Francis Robinson.**—On the 1st inst., there passed away at "Arnside," Prestwich Park, Manchester, after a short illness, Mrs. Robinson, wife of Mr. Francis Robinson, senior partner of Messrs. Dickson and Robinson, of that city. A lady of happy disposition, full of vigour despite advancing years, one whose cheerful presence was always a help and welcomed, she will be grievously missed. The interment took place at Prestwich Parish Church on the 4th. Much sympathy is felt for Mr. Robinson who, owing to indisposition from which he is just recovering, was unable to attend the funeral. Four of the firm's heads of departments paid their last respect to this lady, whom everyone held in great regard. Many beautiful floral tributes were sent.

## ANSWERS TO CORRESPONDENTS.

**BELL-BINE IN AN ALLOTMENT.**—H. H. W. We are afraid that trenching the ground would not rid you of this troublesome weed, but if, when you trench, you took care to remove every portion of the curled underground stems, you would do much towards clearing the land of this weed, every portion of which seems to grow. Another way is to exhaust the vitality of the plant by constantly hoeing it off as it appears through the surface. This, of course, is a long and tedious method of getting rid of the plant.

**CATS IN A GARDEN.**—J. S. It is an old problem how to keep cats out of gardens, and one that has never been solved. You could do something to make access to the garden more difficult by placing tall netting along the fences.

**CELERY DISEASED.**—G. H. We cannot tell from the portion of Celery sent what is the cause of the trouble. If you will send us a plant with the leaves and roots attached, we will do our best to identify the disease.

## MANAGEMENT OF WINTER-FLOWERING BEGONIAS.

—S. T. B. These Begonias require very careful management during their resting period, and should be grown in a temperature of about 55°. They should be stood on a bench near to the roof-glass, and it is an advantage if the bench is a solid one covered with ashes, or similar moisture-holding material, as this greatly helps to retain the foliage on the plants until they commence to develop fresh growth from their bases. The plants should never be dried off; at the same time, water should be afforded the roots very carefully, giving just sufficient moisture to retain the foliage in a healthy condition, and this will be greatly helped by spraying between the pots, so that moist conditions are maintained on the stage on which they are standing. When the plants commence to make fresh growth from the base they may be afforded more water. The young growths should be secured as cuttings when they are three or four inches long. The best single varieties include Optima, Emita, Exquisite, Fascination, Mrs. Heal, Orange King, Her Majesty and Clibrans' Red; good double- and semi-double-flowered varieties are Pink Perfection, Altrincham Pink, Emily Clibran, Clibran's Pink, Flambeau, Scarlet Beauty, Eclipse and Sunrise.

**NAMES OF FRUITS.**—S. J. R. Apple Imperial. G. T. F. Apple New Bess Pool.

**NAMES OF PLANTS.**—D. L. D. 1, Flowers faded, Begonia coccinea; 2 B. Corbille de Feu; 3, B. Haageana.

**PALM LEAF DYING.**—M. L. The Palm leaf sent did not exhibit any signs of organic disease, but had every appearance of having suffered a severe check through either cold or inattention in watering. Too little or an excess of moisture at this season is harmful to Palms, and the danger from overwatering is greater if the plants are growing in a house where very little fire-heat is used. If, however, the atmosphere of the house was kept very warm and dry the plant would dry out quickly, and if not watered frequently the leaves would shrivel as in your case. Perhaps you were unable to obtain an adequate amount of fuel during the time of the coal strike to keep the house sufficiently warm.

**SPRAYING ROSES WITH COPPER SULPHATE.**—P. L. Copper sulphate is usually applied to dormant plants at the rate of three-quarters-of-an-ounce to one gallon of water, but as Roses are already showing signs of growth you should apply the weaker solution, viz., one ounce to two gallons of water. Even then there is a risk of injury to the opening buds. You could use with safety potassium sulphide or liver of sulphur in the following proportions: Potassium sulphide, one ounce; soft soap, three ounces; water two gallons. The soft soap is not essential but renders the specific more adhesive.

**Communications Received.**—G. D.—W. H. M.—D. J.—H. N.—C. C. R.—W. A. W.—E. B.—D. M.—W. E. H. H.—W. K.—H. G. L.—N. E. B.—E. J. B.—J. P.—G. M.

## NEW HORTICULTURAL INVENTIONS.

THESE particulars of new patents, of interest to readers, have been selected from the Official Journal of Patents, and are published by special permission of the Controller of H.M. Stationery Office.

## LATEST PATENT APPLICATIONS.

- 1,195.—Lindsay, R.—Machines for harvesting root-crops. January 14.  
653.—Orbell, H. J.—Flexible fences. January 10.  
719.—Pettigrew, A. W.—Agricultural Device. January 10.  
873.—Pond, S.—Crop-stacking Machines, etc. January 11.  
786.—Provan, D.—Treatment of Bowling greens, etc. January 11.

## SPECIFICATIONS PUBLISHED.

- 263,963.—Howard, Ltd., J. and F., and Steinmetz, A. B. S.—Implements for lifting or digging Beet or other root crops.  
263,591.—Nielsen, C. A.—Steering devices for cultivating implements.  
263,595.—Owen, B. J.—Artificial drying of crops.  
263,597.—Watson and Sons, Ltd., H., and Watson, E.—Electrically-driven lawn-mowers.  
263,635.—Harris, W. G.—Travelling green-houses.

Printed copies of the full Published Specifications may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at the uniform price of 1s. each.

## Abstract Published.

## Chip Baskets.

Patent No. 262,032.

A new pattern of "chip" Strawberry basket enables these receptacles to be nested in each other quite easily so that a good deal of space is saved in storage. The inventor is Mr. J. G. Pratt, of 250, Crownpoint Road, Glasgow. The basket is formed with sharp tapered corners, the side and end portions being formed from two scored strips which are interlaced with other lateral and longitudinal strips to form the body. A pivoted handle adapted to be turned down to rest on the bottom, is provided.

## THE LATEST TRADE MARKS.

THIS list of Trade Marks, of interest to readers, has been selected from the Official Trade Marks Journal and is published by permission of the Controller of H.M. Stationery Office.

## EVERSEAL.

- 473,228.—A preparation in powder or liquid form for protecting plant life against insect and other pests.—Everseal Products, Ltd., Newton Works, Goldsmith Street, London, W.C.2. January 19.

## ANTIS.

- 474,695.—Disinfectants, germicides and vermin destroying preparations in class 2.—William Thomas, trading as H. S. Lovell and Co., 81, Rosebery Avenue, London, E.C.1. January 19.

## CARDIAZOL BRAND.

- 475,657.—Chemical substances used for agricultural, horticultural, veterinary and sanitary purposes.—H. R. Napp, Limited, 3 and 4, Clements Inn, Kingsway, London, W.C.2. January 19.

## CORMORANT.

- 472,803.—Decorticating machines, being agricultural machinery in class 7.—The firm trading as Kingston Industrial Works, 1, Darling Street, Kingston, Jamaica January 19.

REMARKS.—Flowers from home-growers are similar in price to those of last week. Daffodils, Narcissus and Tulips remain firm in price. There is a good selection of Tulips,

both single and double varieties, and more Darwin sorts have been on offer during the past week, Rosy Red being very fine in quality. Lilium longiflorum is slightly firmer in price again. Narcissus ornatus meets with a good demand and some very fine blooms of Narcissus Elvira are available. The quantities of Single Violets and Snowdrops exceed the demand. Increased supplies of Iris tingitana have been on sale during the past week. The newest subjects in this department are a few red Roses of the new crop, which are soon disposed of at high prices. The supplies from the Channel Islands and Cornwall are increasing rapidly; they include Daffodils Golden Spur, princeps, Henry Irving and Orange Phoenix; Narcissus Grand Primo, N. Soleil d'Or, N. Gloriosa and N. Paper White. A few Wallflowers have been received from Cornwall, also a large supply of Snowdrops and Single Violets. Maidenhair Fern is the shortest of all foliage at the present time. Asparagus plumosus and A. Sprengeri is in good demand. Smilax from Guernsey is arriving in good condition. In the French department there is little change to note from last week. Business is fairly brisk for white Narcissus, White Stock, Acacia (Mimosa), Violets, Anemones and Violets.

## GLASGOW.

Supplies of cut flowers continue to show a decline in the quantity of blooms, as many small growers have given up the cultivation of Tulips owing to the unremunerative prices obtained in recent years. Prices, in consequence, keep very steady at the following quotations: Farncombe Sanders, William Pitt and Le Notre, 1.3 to 1.7 (6's), Bartigon, Rosini, Rose Tendre, Flamingo and Ibis, 1.2 to 1.6; Couronne d'Or, 1.2 to 1.4; William Copland, 9d. to 1.3; Prince of Austria, 10d. to 1.2; Murillo, 9d. to 1.1; special, 1.1 to 1.2; double yellow, 1.4 to 1.7; and Lucetia, 1.3 to 1.6. Prices for Daffodils were firm. Sir Watkin and Golden Spur made 1.2 to 1.4 per dozen; King Alfred, 2 to 2.3; Pheasant Eye, 9d. to 10d. Narcissus realised 4.6 to 6 per dozen bunches. Carnations were worth 3 to 4 per dozen. Lily-of-the-Valley, 1.6 to 1.9 per bunch; Lilac, 1.3 to 1.9; Lilium longiflorum, 12 to 14; Mimosa, 4 to 6 per cane. English Violets, 1 per dozen; Snowdrops, 1 to 2 per dozen bunches; Smilax, 9d. to 1.3 per bunch; and Asparagus, 9d. to 1.6.

In the fruit market Apples are becoming scarcer, and buyers have to concede advanced prices. Newtown Pippin ranged from 11.6 to 16 per case; Winesap, 13 to 16; Spitzbergen, 10.6 to 14; and Jonathan, 14 to 16; while Greening advanced to 35 per barrel, and York Imperial made from 15 to 32. Despite the good imports of Jaffa and Murcia fruit, prices of Oranges made a further upward movement. Valencia 360's fluctuated between 15 and 20; 300's, 16 to 24; ordinary, 420's, 25 to 32; and extra large, 34 to 38. Jaffa (144's), 1 and 2 chalks, 16 to 17.6; 3 chalks, 13 to 18; 240's and 250's, 1 and 2 chalks, 18.6 to 19.6; 3 chalks, 16; Murcia Oranges Blue Anchor, 300's and 420's, 35; 240's, 38; and large ditto, 42. Mandarin, 420's, 10 to 12.6. Grape Fruits were worth 28 to 30; Lemons, 12 to 13.6 per box and 16 to 18 per case. English Gros Colmar Grapes realised from 4.3 to 5 per lb.

First consignments of new Potatoes from Algiers realised 4d. per lb. Cucumbers were worth 2.6 to 3 each. French Beans (Madeira) sold for 12 per box; Radishes, 4 per dozen bunches; table Celery, 1.6 to 1.9 per bunch; Lettuces, 6 per crate of 4 dozen indoor, and 8 per crate of 2 dozen outdoor. Rhubarb was worth 34 to 36 per cwt. Tomatoes realised 20 to 30 per bundle.

## TRADE NOTES.

THE following two Standing Committees have been appointed under the Merchandise Marks Act 1926:—(1) For enquiries relating to agricultural and horticultural produce and the produce of any fishing industry: (Chairman) Mr. Edward A. Mitchell Innes, C.B.E., K.C., Mr. George W. Currie, and Sir Basil Mayhew, K.B.E., F.C.A.; with Mr. H. J. Johns, Ministry of Agriculture and Fisheries, as Secretary. (2) For enquiries relating to other goods: (Chairman) Sir H. Llewellyn Smith, G.C.B. (who is about to retire from his position in the Civil Service); the Right Hon. George N. Barnes, C.H., and Mr. F. R. Davenport, with Mr. E. W. Reardon, Board of Trade, as Secretary.

In the Chemical Section of the British Industries Fair at the White City, the dominating feature will be the stand of the Imperial Chemical Industries, Ltd. The agriculturist and horticulturist may not at once see the relationship between chemicals and the plough or the spade, but associated with Imperial Chemical Industries is Nitram, Limited, the newly-formed company acting as sole agents not only for the British Sulphate of Ammonia Federation, Ltd., but also, we understand, for other fertilisers, etc. This concern will have an attractive display on the Imperial Chemical Industries stand, showing the use of chemicals in the production of food-stuffs and cereals of all kinds, as well as

vegetables, while the indirect effect chemicals have through fertilising meadowland upon butter, milk and meat production will be shown.

YET another new garden label has been brought to our notice, and this is entitled the "Helichrysa," which has been patented by the Permanent Garden Label and Holder Co. The label is cheap, lasting and eligible, the standard consisting of a bent wire with prongs which carry the aluminium name plate, and so arranged that the labels are held firmly in position. A small central disc also helps to keep the prongs in position and is useful when the label is being thrust into the ground. When required for use on trees or shrubs the shaft can be bent like a hook. It is impossible for this label to chip or break like earthenware labels, and the lettering cannot become effaced as in the case of painted wooden labels, while if a plant should happen to die, all that is necessary is to remove the embossed label and provide another one suitable for the new plant. The name plate may be sufficiently large to carry a name containing fourteen letters, but it is possible to place two such labels within the prongs, when it is desired to add the source of the plant, its habitat, or other interesting particulars.

READERS requiring information and advice respecting patents, trade marks or designs, should apply to Messrs. Rayner and Co., Patent Agents, of 5, Chancery Lane, London, who will give free advice to readers mentioning *The Gardeners' Chronicle*.

## THE WEATHER IN JANUARY, 1927.

Air pressure was unusually low, and winds from southerly to westerly directions prevailed almost unceasingly. The weather was, therefore, generally mild, but rather wet and stormy, with much cloud. Somewhat curiously, the evenings were mainly fair. An exceptionally large amount of ozone was present in the atmosphere. The mean temperature was 41.1, or 2.2 above the 55 years' average for the month. Both the daily and monthly ranges of temperature were small. Due westerly winds were nearly twice as frequent as usual. Rain fell on 24 days, an excess of six; and the total quantity was 3.75 inches, or an inch more than the normal. There were only 31 hours of sunshine, the deficiency being 12 hours. Ground frost was restricted to seven nights and only two decided frosts occurred in the shade. Hall, however, fell on so many as eight days, and there were small amounts of snow on five days, the month's total depth of the latter, though, being little more than an inch (unmelted). Gales occurred on six dates, but none was of destructive force. Slight thunderstorms were experienced on the 3rd and 27th. Glazed-frost formed on the roads on the 20th and 21st. Joseph Bazendell, *The Fernley Observatory, Southport*.

## GARDENING APPOINTMENTS.

Mr. Lewis Cave, as gardener to C. H. BRANCKER, Esq., Copford Hall, Colchester.

Mr. A. W. Mansfield, for the past four years gardener at Dencombe, Handcross, as gardener to Col. G. H. LODER, High Beeches, Handcross. (Thanks for 2/- for R.G.O.F. Box.—EDS.)

## SITUATIONS WANTED

Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this specified rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

### SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter, or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or if received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.

## MUNICIPAL AND PUBLIC.

**GENTLEMAN, single, with first-class exper-** ience in all branches of horticulture, specialising in bedding, trees and shrubs and alpine, desires position; highest references, excellent qualifications.—C. V. C., Box 36, 5, Tavistock Street, Covent Garden, W.C.2.

## THE BEST IN THE WORLD

UNEQUALLED FOR:

Purity, Brilliance and Richness of Colour

Size and substance of the flowers

Vigour of growth and freedom of bloom

Earliness and continuance of flower

Upright stems and handsome foliage.

We offer strong, healthy, vigorous young plants with three and four leaves, splendidly rooted, from boxes, ready for potting.

## GOLD MEDAL VEGETABLES

The accompanying illustration shows a small portion of our Exhibit of Vegetables at the Royal Horticultural Society's Hall at Vincent Square, on February 8th last.

The Collection consisted of 120 dishes, and included almost every kind of vegetable grown. **The Exhibit was awarded the Society's Gold Medal.**

This is the second Gold Medal awarded this year to "Sutton's Vegetables" at the Royal Horticultural Society's Meetings—a tribute to the excellence of our strains.

"Sutton's Garden Seed Catalogue for 1927" contains full descriptive lists of the best Vegetable Seeds, Flower Seeds, Lawn Grass Seeds, Horticultural Fertilisers, etc., etc. Post Free.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 40.6°.

ACTUAL TEMPERATURE—  
The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, February 23, 10 a.m. Bar. 30.5. Temp. 46°. Weather, Fine.

SCIENTIFIC "papers" recording original observations are generally so strenuous and so technical that though they often make profitable, they rarely make

pleasurable reading. There are, however, occasional exceptions to this drab rule, and Mr. E. M. Marsden-Jones' paper in the *Journal of the Linnean Society* (vol. XLVII, 316, December 31, 1926) is one of them. Mr. Marsden-Jones has, as it were, trod the Primrose path of dalliance with a light foot and an observant eye. He has watched the Primroses by day and by night, and taken careful stock of the company they keep. Thus it is that Mr. Marsden-Jones is able to decide authoritatively between the controversialists who have long disputed the question of the pollination of the Primrose. One school is all for the view that pollination takes place by day; the other, that it occurs at night. The yellow colour—which, however, does not show up well by night, and the "ratheness" of the Primrose—flowering as it does in the spring—are urged in favour of the latter hypothesis. The observations recorded by

Mr. Marsden-Jones seem to settle the dispute once for all. He finds that whereas during the day bees and other efficient pollenisers visit the flowers with sufficient pertinacity and address to cause them to set plenty of good seeded capsules, such fly-by-nights of the insect world as *do* visit the Primrose—and they are few—are rather marauders, a beetle or two and an earwig, *Forficula auricularia*, which has a fondness for the flavour of the stamens and stigmas. Incidentally, Mr. Marsden-Jones records interesting observations on the efficiency—hateful word—of the pollenising bees. It is pleasant to know that these effective visitors, though they make no considerable showing in numbers, get through their work with an activity and address out-rivalling that of afternoon callers making their hasty rounds. *Bombylius discolor* for example, was seen to pay visits to twenty-four Primrose flowers in the course of three minutes. The bee began at a great rate, leaving in the first minute an everlasting record of his business on fourteen flowers; slowing down thereafter to a rate of four in the second, and recovering a little to six visits in his third minute. This record is all the more remarkable in view of the counter attractions in the form and colour of other flowers—which would have distracted any less intent on his work than was our *Bombylius*. Discriminating, too, are pollenising visitors, the same *Bombylius* refusing to call on two flowers, the anthers of which had been eaten by slugs. Not content with observations only, Mr. Marsden-Jones determined to clinch the matter by experiment. He so arranged matters that two lots of Primroses in an orchard—fifty each—were covered, the one from 6 o'clock in the morning till sundown, and the other from nightfall to 6 o'clock in the morning. The result was decisive. On the day-covered plants, not one big capsule ripened, and only five small ones with a few seeds in each. On the night-covered plants there were finally 241 large, and 102 small capsules; and so this interesting little problem has been resolved, and we may now be assured that only those insects that work whilst it is day take part in ensuring that year in, year out, Primroses shall blossom at the sides of our woods and on the banks of our fields. It would seem also that the Primroses without the insects, *Bombylius* and other of like kind, would remain almost, if not entirely, without issue, for as has been noted the day-covered plants failed almost completely to bear seed. Mr. Marsden-Jones has done more than solve a pretty little problem; he has shown how anyone with the leisure and a taste for careful observation can add to the pleasant knowledge of the plants of the country side; for surely the end of science is not only to advance knowledge, but also to add to the sum of human happiness, and in the seeking of such knowledge there is "sweet content."

**The "Gladiolus Annual."**—This is the title of the yearly publication of The British Gladiolus Society, one of the latest of the special societies devoted to a particular flower, and as a first issue the Society is to be heartily congratulated, for it is an excellent journal in every respect, and full of informative articles on the Gladiolus. The aims of the Society are to stimulate interest in and promote the cultivation and improvement of the Gladiolus; to publish reports of its activities and other items of interest to Gladiolus growers; to encourage the production and propagation of worthy, new varieties, and to hold a public exhibition annually. Last year the show was held at Burton, and that for 1927 will be held at Taunton, on August 10 and 11, in conjunction with the Taunton Deane Horticultural and Floricultural Society. A good deal of the history

of the flower is given by Mr. James Kelway in a lengthy article entitled "The Gladiolus." He gives the origins of this various sections and the chief raisers, both in this country and on the continent, and refers in detail to the important work of Messrs. Kelway and Son, and especially of his namesake, James Kelway. Mr. A. J. Macself writes with his usual first-hand knowledge of the Gladiolus of the past and present, and gives good advice as to what should be done by the Society besides holding shows. The list of varieties which figured in the first prize exhibits will be valuable to those making a selection for planting, but probably the most useful of all the contributions is Mr. Amos' Flowering Table, showing the number of days from the time of planting until the first flower opened. Apparently the quickest to bloom was Orillon, in eighty days, and other precocious flowerers were Picton, eighty-eight days; Dr. Horsford, eighty-nine days, and Hermione ninety days; Vesuvius ninety-one days, Geminus, ninety-three days, and Modia, ninety-four days. Compared with these, Evelyn Kirtland was not in bloom under 141 days; and other tardy ones were, Chris, 140 days, Red Canna, 138 days, and Owl, 135 days. The Hon. Secretary of the Society is Mr. A. E. Amos, 10, Bergholt Road, Colchester.

**Horticultural Wedding.**—Mr. Frank Rogers Durham, C.B.E., M.C., Secretary of the Royal Horticultural Society, was married on the 16th inst. to Dorothy Jessie, only daughter of Madame Ellis Browne, of Calgary, Alberta. The wedding was solemnised at St. Anne's, Kew. The staff at Vincent Square made Mr. Durham a presentation of a Crown Derby Coffee Set, and the staff at Wisley, a China Bowl. We understand the honeymoon is being spent in Northern Italy. Our readers will join with us in offering Mr. Durham and his bride hearty congratulations.

**The Humanising Influence of Gardening.**—Mr. H. L. Cancellor, the Marlborough Street Magistrate, stated, before the members of the Publicity Club of London on the 14th inst., that a home had been established at Basingstoke, to which 313 boys, who had been in trouble, had been sent from London. The institution was started nine years ago by a local grower of fruits and vegetables. Of the boys, fifty-seven had gone into the army, four into the navy, forty-five had become gardeners, forty-six were in situations near Basingstoke and eight were on farms. All the boys had found employment. He said that gardening was an industry especially suited to London lads who had been tempted to steal, for it was so different to what they had been accustomed to do in their earlier boyhood. It took them into fresh surroundings, brought them into contact with older men, and had a most humanising influence. In view of the beneficial effect which gardening has been found to exert on youths, he had made enquiries whether something of the same sort might not be done for young women. At Biarritz, he said the French had a large garden colony to which they sent even very long-term women prisoners. The results obtained there were found to be absolutely wonderful.

**Fruit Survey of Scotland.**—In connection with the fruit survey which has been undertaken by the staffs of the three agricultural colleges in Scotland, Mr. Alex. D. Harrison, son of our coadjutor, Mr. A. T. Harrison, Culzean Castle Gardens, has been appointed assistant to Mr. Dudley Howells of the West of Scotland College.

**Orchis praetermissa under Cultivation.**—At a recent meeting of the Linnean Society, Dr. G. Claridge Druce exhibited the original specimens of *Orchis praetermissa*, Druce, together with an example which Mr. B. S. Ogle of Steeple Ashton succeeded in growing from seed and flowering, and also a seedling from the second generation which flowered this year in Oxfordshire—an unique example of a British Orchid being grown from seed for two generations. The progeny in essential features are identical with the grandparents. The species hybridises with *O. maculata*, *O. fusca* and *O. incarnata*. It is widely distributed through Britain and

Ireland, but in the north usually is represented by var. *pulchella*, Druce. *O. praetermissa* is found in France, Belgium and Holland. During the discussion, Mr. H. W. Pugsley suggested that Swedish plants of *O. praetermissa* were probably named *O. incarnata*. Dr. Druce considered this likely as it had now been recorded from France, Belgium, Holland and Denmark. Mr. A. J. Wilmott said that there is a note on St. Brody's specimen in the British Museum Herbarium, stating that he never collected or possessed a continental specimen. The name *rutaceum*, Swartz, used by British botanists should be replaced by *ramosum*, Aschers., as it had been shown that Swartz knew only *B. Matricariae*, Spreng.

**A Herb Shop.**—Under the management of Mrs. C. F. Leyel, the Society of Herbalists, Ltd., has revived an old industry by opening a shop at Culpeper House, Baker Street, W.1, for the sale of medicinal, culinary and cosmetic herbs.

**Trees to Commemorate William Curtis.**—The Bermondsey authorities have planted trees in Crimacott Street, Bermondsey, for the purpose of commemorating William Curtis, the founder of *The Botanical Magazine*. Before moving to Lambeth Marsh—the address given in the early volumes of the *Bot. Mag.*—William Curtis held a plot of ground in Bermondsey, which he purchased, and where he cultivated his first collection of plants; Crimacott Street is considered to be the site of this garden. According to the late Dr. Botting Hemsley, in his "History of The Botanical Magazine" (largely reprinted from *The Gardeners' Chronicle*) which forms the introduction to the *Index to the Botanical Magazine*, published in 1906, Grange Road, Bermondsey, was the site of Curtis's first garden; possibly Crimacott Street of 1927 approximates to the Grange Road of about 1775. William Curtis was appointed Botanic Demonstrator to the Society of Apothecaries, at Chelsea, in 1773; soon after this date he became a public lecturer on botany and horticulture, and established his botanic garden in Bermondsey for the purpose of enabling him "to give a practical turn to his teaching."

**Cigarette Machines in London Parks.**—We are glad to learn that the London County Council Parks Committee has refused to grant a licence to provide automatic machines for the sale of cigarettes in their parks and open spaces. Already too much damage is done by smokers in the public parks, especially in dry weather, to say nothing of the litter created by the paper wrappers being thrown on the ground.

**Ideal Home Exhibition.**—One of the most pleasing features of the eleventh Ideal Home Exhibition, to be opened at Olympia, London, on March 1, will be the gardens arranged in the annexe by leading nurserymen and landscape gardeners. In other parts of the exhibition the art and craft of gardening will be demonstrated, notably in The Village, where the little stream, margined with flowers, will provide a scene of rural charm.

**The "Kew Bulletin."**—The larger part of the new issue of the *Bulletin of Miscellaneous Information* (Part I, 1927) is occupied by an enumeration and descriptions of the Grasses of the Fiji Islands, while the "Flora of the Nearer East" (Part III) fills about eleven pages. The most interesting article is that dealing with the Afforestation of the Falkland Islands, with illustrations. Notwithstanding many failures and disappointments, the work of afforesting the Falkland Islands appears now to have reached a point whence a certain measure of success seems certain. It is of interest to note that Scots Pine and Sitka Spruce give promising results, that *Phormium tenax* has been established, *Nothofagus antarctica* is growing well, and Poplars have suckered freely and provided ready means of increase; that Gorse makes excellent shelter hedges, and that although raising various trees and shrubs from seeds is attended with success, the planting of imported seedlings and young plants is rarely successful. Mr. W. Taylor contributes an all-too-short note on the Prince of Monaco's

wonderful garden, near Monte Carlo, and a few interesting short notes on other subjects are given in the concluding pages.

**Mr. W. Besant.**—On Thursday of last week, the Glasgow City Council confirmed the recommendation of its Parks Committee by appointing Mr. W. Besant successor to Mr. E. Matthews, as Director of its Parks, Botanic Gardens and Open Spaces. Mr. W. Besant comes of a good gardening stock, as his father was gardener to Lady Armitstead, at Castle Huntley, for thirty-five years, and he was born at Castle Huntley. His two brothers occupy important positions in the horticultural world, Mr. John W. Besant being in charge of the famous Glasnevin Botanic Gardens, Dublin, and Mr. James Besant, Superintendent of the Parks at Harrogate. After an apprenticeship at Errol Park, Perthshire, Mr. W. Besant gained experience as journeyman and foreman at the Marquis of Linlithgow's gardens at Hopetoun House; at the Earl of Stair's beautiful place at Castle Kennedy; and at Queen's Park, Glasgow. From this

MR. W. BESANT.

experience at Glasgow, Mr. Besant went to Kew, where he stayed two-and-a-half years, eventually becoming sub-foreman, before becoming Assistant Manager at the Tully Nursery, Kildare, Ireland. Two years later, he became gardener to Sir Harry Greer, at Curragh Grange, Kildare, a delightful Irish garden. In search of further knowledge and wider experience he obtained an appointment with Messrs. R. Wallace and Co., then of Colchester, in their landscape gardening department; this post entailed the supervision of works in various parts of the country over a period of several years. He then accepted the important position of gardener to Gerard C. Sellar, Esq., at Ardornish, Argyllshire—one of the most famous and beautiful gardens in the Highlands of Scotland. Here he remained for six years, carrying out many alterations and extensions. Public service, however, proved an irresistible attraction, and so Mr. Besant's next position was that of Curator of Kelvingrove Park, under the Glasgow Corporation; two years later, in 1923, he was appointed Assistant Director of Parks and Botanic Gardens and now he becomes the Chief Officer, a position of great responsibility and importance, but one for which his energy and wide experience eminently fit him.

**Gardeners' Royal Benevolent Institution, Worcester and District Auxiliary.**—This local branch of the Gardeners' Royal Benevolent Institution has forwarded the sum of £100 to the parent Institution as the result of last year's

efforts. The thirty-second annual meeting of the subscribers was held on Saturday, January 15, at the Farmers' Club, Worcester, when the Rt. Hon. the Earl Beauchamp, K.G., was again elected President, Mr. John White, Rupert Villa, Lower Wick, Worcester, Hon. Treasurer, and Mr. Percy G. White, 51, Broad Street, Worcester, Hon. Secretary.

**A New Tsuga.**—Among the many plants sent to America from Yunnan, China, by Mr. J. F. Rock, is an unnamed species of *Tsuga* which forms a tree eighty feet or more in height with a trunk about five feet in diameter. It has spreading branches and grows at an altitude of 10,000 feet on the eastern slopes of the Likiang Snow Range, in dense forests where there is a heavy rainfall. The needles are dark green, and the rather large, ovoid cones pale brown. Mr. Rock considers this the finest of all the *Tsugas*.

**King's Walden Bury Flower Show.**—The King's Walden Bury Horticultural Society will hold its next exhibition on Wednesday, August 3, in King's Walden Bury Park. Last year the successful local exhibition and gardens were visited by no fewer than 2,500 people. The Secretaries are Mr. A. J. Hartless, The Gardens, King's Walden Bury, Hitchin, and Mr. W. G. P. Clark, York Road, Hitchin.

**Captain Smith's Botanical Library and Herbarium.**—Some twenty years ago the valuable Botanical Library and Herbarium of Captain John Donnel Smith were presented to the Smithsonian Institution, Washington, U.S.A., but have only recently been deposited with the Institution. The library comprises some 1,600 beautifully bound volumes, and the plant collection embraces more than 100,000 specimens. Some of the books are very rare, and many are descriptive of tropical America, especially of Central America. The herbarium was, at the time it was presented, the finest in existence in Central America, and includes many type forms. Besides American plants, it includes many from China, Tibet, Central Asia, India, Australia, Africa, and other parts of the globe.

**Museum of Economic Botany at Reading.**—The Museum of Economic Botany referred to in our appreciation of Dr. J. B. Hurry (p. 108) was presented to the Reading Town Council and not to the Reading University. In asking us to correct this clerical error, Dr. Hurry writes: "I have been for many years a great admirer of your journal and appreciate the immense services you are rendering to horticulturists."

**Scottish Honey Crop.**—At the annual meeting of the Scottish Bee-keepers Association, held at Perth, reports from the various district committees showed that the honey crop during the past season was up to the average. Crops of 80lb, 100lb and 150lb were common, and one "take" consisted of 232lb of section and extracted honey.

**The Old Vineyard at Bury St. Edmunds.**—Some interesting reminiscences of St. Peter's Vineyard, Bury St. Edmunds, were published in the *Suffolk Free Press* of February 3. It appears that the old vineyard has almost entirely disappeared, and offices and shops now occupy a large part of the site. There still remains a large glasshouse which was formerly included in the vineyard. An account of this old vineyard was given in *Gard. Chron.*, December 22, 1866, where it is stated that the vines were planted out-of-doors and under the protection of a tall wall were grown as cordons near the ground or tied up to stakes a yard high, with standards in more open positions. The "standards averaged twenty compact bunches apiece and a more beautiful sight could seldom be seen in England than some hundreds of them heavily weighted with their luscious burdens. A gentleman who had seen large tracts of Swiss and French vineyards this season stated that he saw nothing that exceeded the health and fruitfulness of those at Bury." We learn that the former owner, Mr. John Darkin, still lives in Southgate Street, Bury St. Edmunds, and a tablet on the wall bears the inscription

"John Darkin, 1849," whilst in the vinery is another mural tablet inscribed "W. D. 1832." An old house still exists, in the cellars of which are the remains of some of the wine presses used in connection with the vineyard. About a ton of Grapes were harvested in 1869, and some of the bunches were of very large size; one, weighing 2lb 11oz., of the Royal Muscadine variety, was forwarded to the Editor of *The Gardeners' Chronicle* by Mr. Darkin.

**Presentation to Mr. J. F. McLeod.**—At the annual dinner of the Wickford and District Branch of the Essex County Farmers' Union, held at Wickford on the 15th inst., Mr. J. F. McLeod (formerly of Dover House Gardens, Roehampton) was presented with a silver salver, and Miss McLeod with a clock and volume of Wagner. Mr. McLeod was Chairman of the branch for some years, but resigned the office on his removal to Ware. The salver was inscribed "Presented to James Findlay McLeod, Esq., C.C., by the members of the Wickford and District Branch of the Essex County Farmers' Union as a token of their appreciation of his services as their Chairman, and of the kindly interest he has always shown in their general welfare." Mr. Gill, in making the presentation, said that in him (Mr. McLeod) they had enjoyed as good a Chairman as any branch could possibly have, and they counted it a great pleasure to have had Miss F. McLeod at their dinners for so many years, when she kindly gave her services as accompanist. He had never had an easier task than when collecting the money for that presentation; everybody gave and was delighted to do so. Mr. McLeod, in acknowledging the gift, said it was twelve years since he came among them, and three years since they asked him to become Chairman of the branch. He said he hoped he was not severing his connection with those present, whom he would always be pleased to see.

**M. Florent Claes.**—We are glad to learn that M. Florent Claes, the well-known Orchid grower of Brussels, has been promoted to the rank of Officier de l'Ordre de la Couronne. M. Claes suffered considerably in consequence of the German occupation of Belgium during the war, but he took formerly a prominent place in Belgian horticulture, and created some very beautiful gardens. He visited Colombia in the last quarter of the nineteenth century in search of Orchids for the famous firm of Linden, and several Orchids bear his name.

**Market Drayton Gardeners.**—Gardeners in the Market Drayton district—which embraces portions of Shropshire, Staffordshire and Cheshire—have come together more during the past few months than ever before. The chief reason for this has been a proposal, brought up by the local Tradesmen's Association, to form a horticultural section of the important agricultural show. This idea has not reached fruition in time for the 1927 show, but there seems little doubt that it will mature next year. A prominent member of the Market Drayton Tradesmen's Association, Mr. G. B. Hubank, suggested that the gardeners of the district, although not belonging to any association, should join together at a little social function. The idea grew, and on Thursday, February 17, a large number of gardeners from a wide area dined at the Corbett Arms Hotel, Market Drayton. It was a coincidence that the Chairman, Mr. Mills, gardener at Shavington Hall, should be the 1926 winner of *The Gardeners' Chronicle* Medal, and that Mr. Catt, the 1925 winner, was also present. "Success to Horticulture" was proposed by Mr. G. B. Hubank, and responded to by Mr. Birch, a well-known member of the Shrewsbury Show and a highly-respected gardener. Mr. Birch considered the time was approaching when the good, all-round, practical gardener would be recognised as a very valuable person and as important as any high-class mechanic. They had to live for their work if they wished to be successful gardeners, and by doing so they gained the confidence of their employers.

**Appointments for the Ensuing Week.**—**MONDAY, FEBRUARY 28:** Harrogate and District Horticultural Association's meeting. **TUESDAY,**

**MARCH 1:** Bolton Horticultural Society's lecture; Royal Caledonian Horticultural Society's meeting. **WEDNESDAY, MARCH 2:** Nottingham and Notts. Chrysanthemum Society's meeting. **THURSDAY, MARCH 3:** Manchester and North of England Orchid Society's meeting; Western Commercial Horticultural Society's show (two days). **FRIDAY, MARCH 4:** Post Office Savings-Bank Horticultural Society's lecture; Accrington and District Chrysanthemum Society's meeting; Dundee Horticultural Society's lecture. **SATURDAY, MARCH 5:** Blackburn and District Horticultural Society's meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Acacia dealbata*.—Of all hardy winter-blooming plants with which I am acquainted, this is by far the best. In order to give some idea of its beauty, I may state that it is handsomer, both in flower and foliage, than the well-known *Acacia armata*. The plant here proves that in the neighbourhood of London, at least,

## FLOWER GARDEN.

### KNIPHOFIA UVARIA VAR. SAUNDERSII.

The illustration reproduced in Fig. 75, showing a portion of the Kniphofia garden at Kew, serves to demonstrate the decorative value of some of the best species and varieties of Kniphofia when grown in generous masses. The fine bed in the foreground contains *K. Uvaria* var. *Saundersii*, by no means one of the newer varieties, but still one of the best for planting on a large scale, as it is a good grower and produces its scarlet and yellow flowers in wonderful profusion over a long period. This particular bed was replanted during March of 1926—March being the best time for replanting when this operation becomes necessary. The old clumps were pulled to pieces and strong, single growths with roots attached were selected for replanting; they were planted in groups of threes and fours,

FIG. 70.—THE "THREEPENNY-BIT" ROSE (FARRER 774).

(see p. 147).

it is perfectly hardy; it has been planted twenty years, and now it covers eighteen square feet of wall; it is literally one mass of bloom from top to bottom, and is so conspicuous that it may be seen a quarter of a mile off. I usually take the precaution to nail it close to the wall in autumn—and in case of a continuance of more than 15° of frost, a woollen net is thrown over it; its blooming this year is not an exception; for it has only missed flowering two years since it was planted, and these mishaps were occasioned by the young shoots being cut back by the frost. Every one knows what soil *Acacias* require; but remember, ground for them must be thoroughly drained. *J. Rust, gardener to W. Everett, Esq., Enfield. Gard. Chron., February 28, 1852.*

**Publications Received.**—*The Cultivation of Citrus Fruits*, by H. Harold Hume, Price 21/-. —*A Treatise on Viticulture*, by A. I. Perold; price 25/-. Both published by Macmillan and Co., Ltd., St. Martin's Street, W.C.—*A Garden in Wales*, by A. T. Johnson; Edward Arnold and Co., 41, Maddox Street, W.; price 16/- net.

about six inches apart, the groups being two and-a-half feet apart all over the bed.

For all the strong-growing species and varieties I am certain this is the correct method of cultivation, for if they are divided in the ordinary way and planted back as large clumps, sooner or later the old rootstocks decay, disease sets in and may spread quickly right through a bed, or even through the whole collection.

Kniphofias like to be high and dry during the winter, and our damp winter conditions render it very difficult to keep some of the species in the open safely all the year round; in the south some of the more tender species will withstand our winters if planted at the foot of a warm wall. Although dry conditions at the roots are essential during winter, Kniphofias enjoy copious supplies of water during the growing season.

Kniphofias are often known as Tritomas in gardens; they are especially valuable because of their late-flowering and constitute some of the most attractive subjects in the garden when winter is approaching. The imposing spikes of flowers are mostly of scarlet colour, but there are a few sorts of yellow and lemon-yellow shades. *J. Coult, Kew.*

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Phaio-Calanthes.**—The members of this race of bi-generic hybrids are semi-deciduous, and do not need such a decided rest as *Calanthes*. As the plants pass the flowering stage they should be placed in a dry position in a Cattleya-house temperature, and only receive sufficient water to maintain the growth in a plump condition. After a few weeks rest the plants will commence to grow again, when any that need fresh rooting-material may receive attention.

**Management of the Houses.**—As the days lengthen, the cold may strengthen, and we may also expect bright, sunny days, which will be of great benefit to the various inmates of the different houses. The amount of sunshine will certainly increase appreciably daily, and with the bright spells after cold nights, so often experienced at this season of the year, every attention must be given to the different departments that there is no drastic fluctuation in the temperature or atmospheric humidity. The plants should not be hastened into growth unduly by an excess of artificial warmth and moisture, but allowed to develop according to their natural seasons. During the periods referred to, it is advisable, when it is necessary, to use more fire-heat to maintain the temperatures, to be a little more liberal as regards the damping of floors, stages and paths to counteract a dry, stuffy atmosphere. In ventilating the houses every care must be taken to guard against admitting cold draughts, as these are highly injurious to the plants.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WYVERTREE, Horsley Hall, Gresford, N. Wales.

**Cucumbers.**—Where a suitable temperature can be provided, sow Cucumber seeds singly in small pots. The soil should consist of equal parts of good loam and Oak or Beech leaf-mould. The seeds will germinate quickly if the pots are plunged in a hot-bed, or over bottom-heat of about 80°. So soon as the young plants commence to grow, place them near to the roof-glass to keep them sturdy. Maintain a humid atmosphere in the house, and a minimum temperature of 65°. Prepare soil composed of two parts fibrous loam, one part leaf-mould, one part old Mushroom-bed manure, and a little mortar rubble. The compost should be placed in mounds on a hot-bed or over bottom-heat, in readiness for setting out the young plants so soon as they are sufficiently strong. Take full advantage of sun heat, but open the ventilators slightly when the temperature rises above 83°, and close them again early in the day to conserve as much natural warmth as possible.

**Turnips.**—To obtain roots early, sow seeds either in cold frames or on a very gentle hot-bed. Choose a quick-growing variety, also one with a small top, such as White Gem or Early White Milan. Sow the seeds thinly in rows made about one foot apart, and thin the seedlings at an early stage. The soil should be similar to that recommended for Lettuces in a previous calendar. Ventilate the frame freely on all favourable occasions.

**Early Celery.**—Where Celery is required very early in the season, a small sowing should be made now. Sow the seeds thinly in boxes or pans; water the soil carefully and germinate the seeds in a temperature of about 55°. So soon as the seedlings appear, place them near to the glass, and never allow them to suffer a check at any time.

**Seed Beds.**—Advantage should be taken of all favourable opportunities, when the ground is sufficiently dry, to fork over the plots which are intended for sowing Onions, Parsnips, Carrots and other crops. If this is done now, the soil will have settled by the time it is required to sow the various crops. It also allows the weather to act on the rough lumps of soil and assists generally in obtaining a good tilth. Should soil pests have previously been troublesome a proved soil fumigant may be applied at this time and forked into the ground.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brockett Hall, Hertfordshire.

**Perpetual Carnations.**—Plants that were raised from cuttings in November last should now be ready for transferring to larger receptacles. Pots three-and-a-half inches in diameter are a suitable size at this stage of growth. The compost may consist chiefly of loam, to which may be added some old material from a spent Mushroom-bed (after being passed through a coarse sieve), bone-meal and silver sand. The young plants should be potted fairly firmly and grown on in a cool temperature of about 50°; this amount of warmth is suitable in dull, sunless weather, but the temperature may be allowed to rise during sunny days and the extra sun warmth will prove beneficial to the plants. Watering needs to be done carefully as Carnations resent stagnant conditions at the roots. Air should be admitted to the house freely whenever the outside conditions are favourable, and unless severe frost is likely to occur at night, the top ventilators should never be tightly closed. At this potting choose varieties best suited to the requirements of the establishment, for while certain sorts of Carnations will thrive in some localities they are a failure in others. This is probably due to a difference in atmospheric conditions, either the house not suiting some or the neighbourhood being unfavourable. Continue to insert cuttings of the varieties most needed as they become obtainable; they will soon develop roots if treated as previously advised.

**Pelargoniums.**—Old plants of Pelargoniums that were cut back last October and shifted into smaller receptacles than those in which they were grown last year, may now be transferred to their flowering pots. These plants will thrive in quite ordinary soil, but much leaf-mould is not to be recommended for the final potting. Rather use a small amount of old Mushroom-bed manure and sand to render the compost porous. When the plants are established in the new soil all growths should then be stopped to promote a bushy plant. Rooted cuttings that have been placed singly in small pots and have had their tops removed to favour a stocky growth, may be transferred to their flowering pots as they become ready. Grow the plants near the roof-glass in a moderately cool house.

**General Remarks.**—Continue to introduce bulbs and flowering shrubs into a warm house in sufficient quantities to meet the demand of the establishment, always bearing in mind that fresh flowers will last much longer than those that have been open for some time before they are used. Bulbs and shrubs that have passed out of flower should be stood in a cool house; the bulbs may be planted out later in grass for naturalising.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to THE EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Strawberries.**—To cultivate these plants satisfactorily they should not be grown in loose soil. They delight in a firm rooting-medium from the time they are planted, and for this reason the ground intended for their reception should be well-trenched and manured liberally some weeks previous to setting out the runners, to allow time for it to become consolidated for planting. When trenching the land break up the bottom spit to ensure water draining

away freely in very wet weather. Mix the manure thoroughly with the soil as the work of trenching proceeds. Healthy, young plants usually produce the best results. Plants which have been forced, duly hardened, and subsequently planted in suitably prepared soil, will yield very heavy crops of large fruits the following year. Those who intend to make a bed from forced plants when the time arrives should have the site prepared in readiness for their reception.

**Established Beds.**—Beds in bearing should be kept free from weeds, and if not mulched, the surface soil should be pricked up lightly with a fork and enriched with a liberal dressing of well-decomposed manure. Failing this, apply a good dressing of soot, bone-meal, or artificial manure.

**Quince and Medlar.**—The pruning of these fruits is very similar to that adopted for Apples. The heads should be thinned more or less each year, crowded heads relieved of some of their ill-placed branches, and old, useless sprays removed so that light and air may reach the interior of the tree. Select a warm, sunny position for these fruits and a sweet, rather moist soil. The fruits of both kinds are usually in demand. Both the Apple and Pear-shaped Quinces are dependable varieties, and the Nottingham is one of the best Medlars.

### THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic  
Gardens, Kew.

**Iris unguicularis (syn. stylosa).**—It is surprising that this beautiful Iris is not more generally cultivated, for it has a long flowering season, and produces a large number of flowers which are deliciously fragrant. One often hears complaints that this Iris transplants badly, which is quite true if it is done at the wrong time, but if this operation is performed about the middle of March it presents no difficulty. As this plant is a native of Algeria it requires a hot, sunny situation and poor, stony ground, for if given a rich root-run it develops too much foliage at the expense of flowering. In situations where it grows too luxuriantly the leaves should be shortened about half during the summer; this treatment has no injurious effect on the plants and induces freedom of flowering. As this Iris flowers throughout the winter and early spring, some protection is necessary for the spikes, even during times of slight frost. It is important that the flowers be pulled out at the base, and not cut, as what appears to be the flower stem is really the long, flower tube; it is also best to pick them in bud, as the open flowers are very fragile and easily damaged. In cold districts this Iris is certainly worth the shelter of a cold frame. There are several varieties, including a white one, but although all are beautiful, I consider the type plant is as useful as any where large quantities of cut flowers are required.

**Annuals in the Wild Garden.**—Hardy annuals may often be used in a very effective manner in fairly open spaces in the less-dressed portion of the garden, and especially on the fringe of the dressed and wilder parts. Where ground has been cleared of trees or shrubs it is a good plan to sow at least a portion of the site with suitable hardy annuals. Some of the annual Poppies are excellent for this purpose, including the many single and double varieties of *Papaver somniferum*, the Opium Poppy, also the many varieties, including the Shirley strain, of *Papaver Rhoeas*, our common field Poppy; *P. pavonium* and *P. umbrosum* are also very suitable for the purpose. *Callistephus chinensis*, the common China Aster, is very effective in such places during the autumn. Cornflowers, *Chrysanthemum carinatum*, *Calendula officinalis*, *Godetias* and many other subjects will readily suggest themselves. Employ the larger-growing plants for producing big effects. Where there is space, this method of growing annuals is capable of being a very pleasing phase of gardening.

## FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Early Permanent Vines.**—Stopping, tying, and regulating the shoots and removing superfluous bunches, leaving one only on each shoot, will now call for daily attention. Having maintained a low temperature in dull, sunless weather, especially at night, the grower should now increase the temperature of the house gradually until a minimum of 60° to 65° is reached, with 10° higher by day, by the time the first flowers open. Reduce the amount of atmospheric moisture slightly, as Grapes, set best in a brisk temperature with the air in circulation. Successional vineries containing a mixed collection of varieties may be syringed with warm water two or three times daily, according to the state of the weather. Let the temperature of the house be 55° at night and 60° by day until the bunches are prominent, then discontinue direct syringing, but damp the floors and other available spaces and allow the temperature to rise considerably on sunny days to draw out the bunches.

**Strawberries.**—The earliest plants will be in various stages of development, some throwing up their flower stems and others swelling their fruits. Remove the plants as they come into flower and place them widely apart in the lightest part of the house where fresh, warm air can circulate freely amongst them. A number of the smaller blooms may be pinched off before they open with advantage to the remainder. When the berries have set, complete the thinning to six or eight fruits on each plant. Syringe the latter well and remove them to shelves close to the roof-glass in a house having a temperature of 60° to 65°; the temperature for those in bloom should be kept as near 55° as possible. Pollenate the blooms by means of a rabbit's tail at midday. Feed the roots freely until the berries show signs of developing colour, then use only clear water, reducing the amount of moisture gradually when the berries are well coloured. If the plants are placed in a warm, dry house for a day or two when the berries are ripe the flavour will be improved.

**Successional Plants.**—Fresh batches of Strawberries should be placed in light pits according to the demand of the establishment. Stand them well up to the glass, and keep the temperature of 45° to 50° on mild nights and a few degrees higher by day. On no account should the growth of the plants be hurried. Admit air freely when the weather is favourable and remove the most promising plants to fill up the shelves in the houses as they become vacant.

## FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Pricking Out Seedlings.**—This important work will now occupy considerable time, and must be attended to before the seedlings become crowded in the seed-pans. If the necessary number of boxes is prepared in advance and filled with compost to suit the various plants, the work will be more expeditiously carried out. A careful calculation of the numbers of each subject likely to be needed will be useful in reducing the work to actual requirements, always allowing a margin for possible losses. The aim of the cultivator should be to get the maximum number of plants into each box or pan, while giving them sufficient space to develop. Very small seedlings, such as Begonias, may be pricked out about one inch apart at the first operation, and when they have increased in size so as to be almost touching each other, transferred to other boxes and given more room. Seedlings of Lobelia need not be pricked out singly unless the numbers required are very numerous, but do well if small tufts containing three or four seedlings are pricked off together. These may be divided later, and their numbers doubled at the second operation.

**Dahlia Tubers.**—Where additional stock is required, Dahlia tubers will be best started in the propagating house, in a fairly high tempera-

ture, in order to induce them to start into growth early. So soon as the young shoots are from three to four inches long they may be detached and inserted as cuttings. Where a large stock of tubers of such popular bedding varieties as Coltness Gem and Dunecht Yellow has been retained from last season, it will be sufficient if the tubers are now placed in boxes of sand and leaf-mould and set in any house from which frost can be excluded. These tubers will start into growth naturally as the season advances, and may be divided and repotted in preparation for planting out in June. Old plants treated in this manner are well adapted to filling large beds, and they will give a tremendous crop of flowers, far surpassing the younger plants raised annually from cuttings, although the latter make the best material for retaining the following winter.

## ALPINE GARDEN.

## GENTIANAS.

FROM the tiny, turf-studding Gentians of the Alps, through many and various intermediate shapes and forms, to the stately spires of *G. lutea*, the genus *Gentiana* presents a fascinating study to the specialist of alpine flowers, and the popularity of the plant seems to be increasing by leaps and bounds, especially since the introduction of some notable Asiatic forms within recent years. They are, however, not all good and a timely warning may be of service to the inexperienced for *G. Crucjata*, *G. tibetica*, *G. phlogifolia*, *G. Przewalskii* and *G. punctata* are among those large, leafy and dingy-flowered

FIG. 71.—GENTIANA PURDOMII.

(see p. 144.)

**Perpetual Carnations.**—Cuttings of these Carnations, inserted last month, are now well-rooted and should be placed singly in thumb pots. A sandy loam passed through a half-inch sieve and heated to the same temperature as the house in which the plants are growing, should be used, and every care taken that the young plants do not receive a check while they are being potted. This work may be carried out by erecting a temporary bench and doing the work in the house in which the plants are growing, returning the newly-potted plants to the same site previously occupied, and ensuring them a growing temperature of 55° to 60°. So soon as it becomes evident that they have rooted in the new soil, and before there is any tendency of their becoming drawn, they should be removed to a cooler house, and afterwards grown on as hardily as possible. The labelling of a large collection of Carnations takes considerable time, but must be attended to, as few plants are less easily recognised from their foliage alone.

species which are not worth garden room, except where a representative collection is desired.

The two outstanding members of recent Asiatic introductions are *G. sino-ornata* and *G. Farreri*, both so often and well described as to be well-known to those even who do not already possess them.

*G. sino-ornata* seems to have become quite at home already, and has shown us quite plainly what it requires in the way of successful culture, namely, plenty of leaf-mould and silver sand, and full sun. Given these conditions it thrives and multiplies and produces an autumn show of unequalled splendour. *G. Farreri* is not quite so easy, and for one garden where it is really happy, there are a dozen where it simply exists, and sometimes not even that for long. I know of one patch, planted in precisely similar conditions to *G. sino-ornata*, that is all that could be wished. It is growing not two miles from my garden, yet my plants, although treated likewise,

just dwindled, and so far, the best success I have attained with this species has been by planting it in almost pure fibrous loam, where it is at least mildly contented, which is something, and a step in the right direction. It is readily increased from seeds, and so is *G. sino-ornata*, when it is possible to procure any, but this species flowers very late in the season, and my plants never set seeds. I think mine must be an especially late-flowering form, as up to December 1st, I had several plants still in bloom. Cuttings of *G. Farreri* root very easily, but they should be inserted in the autumn as there seems to be a surprising mortality among spring cuttings after they have been struck and potted, why, I do not know.

Almost all of the tiny, high alpine species

it, unless it be a solid sheet of *G. acaulis* at its best, than which I am sure nothing could be more lovely.

*Gentiana amoena* is apparently a gem of gems, though not in cultivation. It is a native of Sikkim, at about 17,000 feet, and forms a shining tuft of less than two inches high. The flower is a big blue bell with upright lobes. The description inspires me with the feeling that I shall never be truly happy until I can gloat over my plant (or plants) of *G. amoena*. *G. pyrenaica*, though both tiny and precious, is not a genuine aristocrat of the high Alps, but forms comfortable masses in turfy places, either damp or dry. It occurs in the Pyrenees, whence it gets its name, in the Carpathians, and in Western Asia. In cultivation it does

Gentian bed or scree, but it greatly resents root disturbance, as, indeed, do most of the Gentians.

A species, the merits of which seem not yet to be fully realised, is *G. Purdomii* (see Fig. 71). Until last year, I had not seen it at its best, and the plant that I did see was a revelation to me. It is of rather loose-growing habit, with longish, narrow leaves, and radiating from the centre are numbers of trailing flower stems, each with several upborne flowers of a fine, rich blue. I am convinced that a mass of this Gentian in full flower would be a sight to rival almost any other Gentian. I cannot yet state from personal experience what soil and aspect it requires, but I believe it does well in a fairly rich, free medium and in full exposure to sun.

Of *G. Kurroo* I would write with enthusiasm, but my attempts to obtain the true plant have been so numerous and so vain, that I am at last getting disheartened, and am beginning to wonder if it can be obtained at all. One gets *G. Purdomii*, *G. Kesselringii*, *G. Prezwalskii* and heaps of others, but *G. Kurroo* remains conspicuous solely by its absence. Farrer terms it "A Gentian beautiful among all other beautiful Gentians," and further states that it forms a tuft of long, narrow leaves, glossy and dark green, from which in late summer proceed several smooth stems which trail for four or five inches and then rise gracefully to show their three or four wide open cups of pure, rich blue, with lighter markings in the throat.

*G. hexaphylla* (Arethusae), I am afraid has rather disappointed me; it is rare, and the foliage is very distinct and characteristic, but the flowers are a rather poor colour, and they do not open very wide, yet it is a plant of great interest. It is one of the Asiatic species, and answers well to the conditions required by the other members of that group.

I had intended, on commencing these notes, to keep more or less to the order of the groups, but I find myself much happier describing varieties more or less as they come to mind, so I will now take a far leap and come to the stately *G. lutea*, the vast and glorious yellow Gentian of the Alps, which, alas, is rapidly becoming rare in many districts, as the natives have discovered the value of its huge, medicinal root. With its large, corrugated leaves and towering spikes of golden flowers in dense whorls, rising to a height of four feet or even more, it is a noble sight in the alpine hayfields. The large and deep-delving roots render it almost hopeless to collect with any chance of success, but the seeds germinate very rapidly, and though the seedling takes some years to arrive at flowering size, it is well worth waiting for. It grows best in a deep, rich loam, and may be naturalised in meadow land.

Another of the taller Gentians that may be called indispensable is *G. asclepiadea*, or the Willow Gentian, a native of moist woods and damp fields of sub-alpine regions. It should be planted in deep, cool beds, where it will develop its graceful three-foot stems, studded along their upper half with the sapphire blue trumpets tucked in the axils of the dark, oval leaves. There is an extremely rare and very beautiful white form in existence, which is free from the dinginess of so many of the albino Gentians.

The larger Gentians do not appeal to me so much as the tiny species, but I certainly must admit their grace and garden value where space allows them to be planted, not in twos and threes, but in sufficient quantities to repay their willing efforts to give an imposing display.

There are many others that I could enumerate, but I will terminate these notes with a plea, if any Gentian lover more fortunate than myself should have any of the following varieties to spare, and be willing to exchange, I should be enchanted if he would communicate with me:—*G. altaica* (true), *G. amoena*, *G. barbellata*, *G. bellidifolia*, *G. Boissieri*, *G. Boryi*, *G. calycosa*, *G. coronata*, *G. depressa* and *G. Favratii*. Will Inghersen, *The Birch, Sharpthorne, Sussex*.

FIG. 72.—NARCISSUS TELAMONIUS PLENUS, SHOWING FLORAL DEGENERATION DUE TO POOR "STRAIN."

(see p. 145).

answer best to scree treatment; they seem fairly indifferent whether the scree be composed of limestone, granite or sandstone, the main thing is that it be gritty enough and well-drained. Underground water is an advantage if it can conveniently be arranged, but I find the plants do perfectly well without it.

*G. verna* must be placed first among the species as it is the best known, and I am inclined to think, the most beautiful, though this I can never quite settle satisfactorily in my own mind, especially when standing before a well-flowered plant of *G. bavarica*, or *G. terglowiensis* (syn. *imbricata*), but a really good *angulosa* form of *G. verna* covered with its wide-open, intensely blue flowers, always reduces me to the silence of adoration, and I feel that nothing can surpass

well in sandy peat, and a sunny, moist situation, though I have had it thriving happily in pure limestone scree, against all precedent, but I should not advise this treatment as a general rule. It makes dense carpets of tiny shoots, clothed in glossy, sharp-pointed leaves, and the long, narrow calyces, expanding into dusky violet stars, appear in May and June. The plant is a great favourite of mine, though the colour, is not popular with everyone.

*G. Froelichii* is too seldom seen in gardens, for it is a little treasure, and presents no great difficulty as regards culture. It throws its two inch-high stems above tufts of pale green, narrow-grooved leaves, each stem carrying a single flower of clear pale blue. The species should be placed in the choicer part of the

## IMPORTANT NOTICE to GARDENERS

Messrs. Geo. Monro Ltd. beg to announce that the services of their Advisory Department are open to all professional or amateur gardeners and that their enquiries will be welcomed. The Department is situated at Waltham Cross, and the laboratories are staffed with qualified assistants who deal with all enquiries relating to plant diseases, insect pests, manurial requirements, cultural difficulties, and all matters relating to the practice of Horticulture. No charge is made for this advice, the object of the Department being to give service.

In addition to this free service, chemical and mechanical analyses of soils are made (a fee of £3 3s. is charged for a full analysis) and a report sent on manurial requirements of the soil, together with any operations which should be taken to increase its productiveness. By this means a great saving is accomplished because of the unnecessary expenditure sometimes resulting from injudicious application of manure.

All enquiries should be addressed to Technical Adviser

BERKHAMSTED, Herts.

## Stephens' Outdoor Ink

A NEW INK for writing  
with ordinary pens on  
SHINY SURFACES. Writings  
made with it on many METALS,  
on CELLULOID, PAINTED  
WOOD, etc., are unfading  
and waterproof. On glass they  
are unfading but not waterproof.

## For Garden Labels

etc., which have to stand  
exposure OUT-OF-DOORS it is  
the most serviceable Ink.

Indelible pencil writings  
"run"; other fluids fade or  
dissolve in the rain unless pro-  
tected by glass slides, etc.  
STEPHENS' OUTDOOR INK  
neither runs nor fades.

Sold only in 6d. Bottles by  
Seedsmen, Stationers, &c., or  
post free 9d. from

**HENRY C. STEPHENS, Ltd.,**  
57, Aldersgate Street, LONDON, E.C.1.

## IMPORTANCE OF "STRAIN" IN COMMERCIAL VARIETIES OF DAFFODILS.

MANY growers of Daffodils, more particularly amateur growers, when purchasing bulbs for spring flowering, make a practice of comparing the catalogue prices of certain varieties, and place their orders with the tradesman whose prices are the lowest. In any ordinary sphere of commerce the criterion of price in connection with a named or proprietary article is a reasonably safe one, but this does not apply with similar exactness to the purchase of bulbs. I do not think it is generally known that after a bulb has passed its initial stages of growth the stocks subsequently created from offsets are likely to vary to an increasing degree until, within the course of a few years, the progeny may become almost, if not entirely, unrecognisable as the same variety.

For this reason alone the price paid for bulbs of any given variety should not wholly influence the purchase. Under ordinary circumstances where dealers do not grow their own stocks, comparative prices for bulbs of similar size and of the same variety, form a reasonably good guide to the economy of the purchase, for the simple reason that large growers of commercial stocks seldom make any selection beyond grading the size of the bulbs sold. These will provide, in due course, progeny of both of the classes of stock referred to. A moment's consideration of the above facts will show that the bulbs of rapid increase will quickly outnumber those of slower progression, and as a result it takes but a few years for an unselected stock to exhibit wide variations in the size, substance and general quality of the flowers.

A secondary line of variation in bulbs is the tendency for offsets to vary from the parent in type. This is more marked in some

ately, all too common where increase of stock has been the first consideration for any length of time.

The accompanying photographs illustrate the above argument. Figure 73 represents a series of flowers from a healthy, commercial stock of Golden Spur. At first sight and to the casual observer, a group of these flowers would be regarded as similar, but closer examination shows that under identical conditions of culture, not only are there variations in size, but also in form. Trumpets are nearly parallel in some instances, and widely-mouthed in others; perianths vary in texture, colour, size and character. Some of the flowers closely approach those of *N. obvallaris*; others might easily be mistaken for Henry Irving.

Figure 72, reproduced on p. 144, is a further illustration of the variation in *N. Telamonius plenus*. Some bulbs produce flower which split badly, while others exhibit a well-defined substantial and flat perianth, with a

FIG. 73.—NARCISSUS GOLDEN SPUR, SHOWING BAD AND GOOD "STRAINS."

This does not apply only to the *Narcissus* family; but to widen the reference beyond this species is outside the scope of the present article. The variation proceeds along two well-defined lines.

On lifting a stock of bulbs at the conclusion of a season's growth it will be found that under exactly the same conditions of culture a proportion of the bulbs have produced one or two offsets, while others will be found surrounded by a large number of smaller offsets. At first sight these latter will be regarded as the better bulbs, but such is not the case, as the vitality of the individual offsets is substantially less than where a smaller number of offsets has been produced. If stocks are bred by selection from these two classes of bulbs the flowers in the course of no more than a year or two will show a very marked difference in stamina. In the one case (large offsets) the features of the original parent will be maintained, and by careful marking and selection at flowering time may be improved, while in the other case degeneration will be progressive.

varieties than in others. Close examination of the flowers produced from any given number of bulbs of the same variety will show a small percentage of variation in intensity of colouring, flatness or twist of perianth, expansion and shape of the crown, etc. It will be found that if the bulbs exhibiting these characteristics are marked and selected the peculiarities will, in most instances, be reproduced and may be intensified in the progeny.

Stocks of bulbs which have been forced and allowed to recuperate and forced again over a period of years, rapidly lose stamina. Apart from the disappointing quality of the flowers ultimately produced, they are, like every other order of vegetable and animal creation which has been subjected to unnatural conditions, liable to become hosts to every form of disease. It is seldom, indeed, that we find eelworm or any other complaint in the long-established, "overcrowded" clumps of *Narcissi* which are to be found growing untended in shrubberies and cottage gardens throughout the country, but such complaints are, unfortun-

beautiful central rosette, the colour of which again varies from pale yellow to orange. It is of passing interest in connection with this variety, commonly known as "Van Sion," or "Von Sion," that Parkinson, writing in 1629, refers to it as having been introduced by one Vincent Sion, "dwelling on the Banks side in his lives time, but now dead; an industrious and worthy lover of faire flowers." From which record it would appear that the process of years has brought an unauthorised variation in name to add to the variations in the structure of the flower.

To bring the subject to a conclusion, too much stress cannot be laid upon the necessity for constant selection and re-selection from year to year in order to maintain the stamina and true character of any given variety of *Narcissus*.

From a purchaser's point of view, this constant selection is reflected in the relative cost of similar varieties offered for sale by different growers. Herbert G. Longford, Abingdon, Berkshire.

## EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

Letters for Publication as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Urgent Communications.—If sent by telegraph, these should be addressed "Gard. Chron., Rand; or by telephone, to Gerrard, 1543.

Editors and Publisher.—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

Special Notice to Correspondents.—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

Illustrations.—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

## ADONIS GARDENS IN SCRIPTURE.

(Concluded from page 82.)

ALTHOUGH other interpretations have been suggested and are possible, it is usual to regard the Adonis story as a Solar myth, and speak of Adonis as the Sun-god. He is slain by the Winter, who is represented as a wild boar, lamented by Aphrodite or Venus, and in response to her pleadings allowed to return to earth during a certain period of the year. The variants show that the story is composite. We have now, however, to try and discover the meaning of Isaiah's phrase "pleasant plants, plants of Naaman, or Gardens of Adonis." Professor Cheyne remarks on the passage (*Isaiah*, XVII, 10) that "Classical students will of themselves compare Isaiah's phrase with the 'Gardens of Adonis' (pots or baskets filled with herbs, which soon withered in the sun as Adonis was killed by the boar), the proverbial phrase for something which arises quickly but does not last." The Hebrews have forsaken the enduring rock of salvation for the fading flower. They have turned away from the living fountain that they may visit the broken cistern. They have turned their backs on Jehovah and their faces on Adonis.

"There is, I think (continues Cheyne), a similar proverbial application of the Hebrew phrase included in the meaning here. 'How quickly the Adonis Gardens fade! So quickly shall the devotion of the Israelites to false gods end in disappointment!' Such appears to be the thought of the prophet."

But since we are not all classical students, the question will naturally arise: Where can we learn something of these Gardens of Adonis which the Jews, in imitation of their polytheistic neighbours, had learned to plant? To rewrite the story in detail from the notices which are scattered up and down the literature of the past would be a task too lengthy and exacting. I will therefore select a few of the most salient facts. Many plants have borne the name of Adonis. Thus, the Pheasant's Eye, the red Anemone, the Argemone, the red Chamomile and the Rose are among the flowers named Flos Adonis. But in Hesychius we find it stated that the Lettuce was occasionally termed Adonias. The earliest classical reference which I have found is from the lips of Socrates: "Will a sensible husbandman (he asks, in the

*Phaedrus*) plant the seeds which he cares for, and wishes to bear fruit, in summer time, hurriedly, in the Gardens of Adonis, and then exult at seeing them sprout up finely within eight days? Or will he not rather, if he plant such seeds at all, do it for the sake of amusement or a festival? While that which he is in earnest about, he sows according to the rules of agriculture in a suitable soil, and is content if he sees it reaching its prime in eight months?"

From this allusion, apparently, sprang the proverbial expression—Gardens of Adonis—as a byword for anything which quickly flourishes and as quickly dies. To Theocritus, one of the Greek poets, we owe an allusion to these tender or delicate gardens which sometimes flourished in golden baskets—recalling the "Apples of gold in pictures of silver," of the Old Testament—placed by Berenice beside the image of Adonis. Archdeacon Hare thinks that Pliny misunderstood the nature of these pots of herbs when he mentioned the Gardens of Adonis along with those of the Hesperides and of Alcinous, as objects of great admiration among the ancients. In this surmise, however, the venerable Archdeacon may be wrong, since

intended as symbols of the life and death of Adonis. But when we find the Alexandrians using meal in the place of flowers and herbs we seem to see another proof of the composite character of the legend. Frazer holds that Adonis was a Corn-spirit, and if so, he would be rightly served with meal and grain, with honey and oil.

In our own poets are found evidences of familiarity with this subject.

"Divinest creature, *Astraea's* daughter, how shall I honour thee for this success? The promises are like Adonis' gardens, that one day bloomed, and fruitful were the next." So says Charles to Pucelle in the first part of *King Henry VI*, showing that, to Shakespeare, these gardens spoke of rapid fruition. Spenser, too, when recounting the origin of fays and elves, mentions them as the spot where the first elfe and the first faye met. In the *Faerie Queene* (iii, 6) there is a description of the gardens which cannot here be quoted.

We naturally expect to find in our classical-minded Milton an allusion to this subject, and we are not disappointed, except that, like Pliny, he links together what to many

FIG. 74.—PINUS MONTANA MUGHUS VAR. SLAVINII.

(see p. 147).

Domitian is known to have planted, near his Stadium in Rome, gardens in honour of Adonis; and since Pliny and Domitian were contemporaries, we must assume that the writer of the famous *Natural History* used the expression discreetly and with full knowledge of its different uses. More than one description has come down to us, and our own poets, such as Shakespeare, Spenser and Milton have not been slow to use the allusion for their own ends.

Gardens of Adonis are generally described as quick-growing plants reared in pots or baskets, and carried by worshippers at the festival of the god. Among the plants so grown were Lettuce, Fennel, Cress and the like, and not merely cut herbs, as some writers would lead us to suppose. The custom varied, indeed, and varied widely in different places. Thus, at Alexandria, Adonis Gardens were sometimes baskets of silver, sometimes golden boxes or jars, while Myrrh, cakes made of honey, oil and meal in the likeness of things which creep or fly, were employed. The use of Myrrh was in allusion to one form of the legend which made Adonis the offspring of Myrrha or Smyrna. In the Athenian festival small pots of flowers which faded rapidly were in vogue. They were

will seem inappropriate allusions. To him Eden is:

Spot more delicious than those gardens feign'd  
Or of reviv'd Adonis, or renown'd  
Alcinous, host of old Laertes' son.

I find, indeed, that Bentley has raised an objection to the passage, but cannot help thinking that this is due to the fact that the term Gardens of Adonis was thought to apply only to pots of herbs or baskets of flowers, whereas it had a wider application.

There is a point of peculiar interest to gardeners arising out of this subject. Some hold that the festival of Adonis was celebrated in winter and that in order to obtain the plants necessary for the observance strong natural and artificial heat was used in the room in which the pots were placed to hasten the growth of the plants. That raises the question: When were conservatories, hothouses and artificial heat first employed? The reader interested in the subject may find it discussed with all his usual learning by Humboldt in his *Cosmos* (English Translation, Bohn, ii. 450). He follows Boeckh in the opinion that the Adonis Gardens consisted of plants in small pots, such as Lettuce, Fennel, Barley and Wheat, but not variegated flowers

or Mignonette, which were intended to represent the garden where Aphrodite met Adonis—symbol of the quickly-fading bloom of youth, of luxuriant growth and of rapid decay.

Since festivals, known as Adonia, were from very early times celebrated annually at Alexandria, Athens, Byblus and elsewhere in memory of the death of Adonis and his return to life (as some variants affirm), so it was inevitable that the Jews, who were in touch with these places, and always exhibited a marked weakness for such observances, should become familiar therewith, and wish, in times of relapse from the sterner monotheism of the prophets, to adopt the same. Indeed, when we learn that the women of Sidon mourned for Adonis we readily understand the Tammuz cult of the lapsed Israelites and the Adonis Gardens of the idolatrous Jews.

Much more might be written respecting the Gardens of Adonis in their biblical associations, but the study must be brought to a close. Since the field, however, is extensive, and some of the details are unfamiliar, it may be well

## PLANTS NEW OR NOTEWORTHY.

### FARRER'S THREEPENNY-BIT ROSE.

THIS Rose appeared as a distinct seedling in a pot of young Roses raised from seeds sent home by the late Mr. Reginald Farrer. It differed so widely from its companions that we planted it out separately and unwisely trusted to memory for the number under which the seeds came. I believe it should be "F.774, a small, thorny bushlet from the northern foothills of the Da-Ba-Say," and that the others in the pot have proved to be varying forms of *R. graciliflora* (Rehder and Wilson). So far as I can learn, nothing exactly resembling the plant shown in the accompanying illustration (Fig. 70) was raised by others who had a share in these seeds from Farrer.

It is not represented among dried material sent to Edinburgh by Farrer. Thus it still lacks a specific name, and is known to those who have admired it here and carried away plants

the plant demands a position in the open, where it may form a specimen at least twelve feet in diameter. *E. A. Bowles, Myddelton House.*

### PINUS MONTANA VAR. MUGHUS, WILLK., FORMA SLAVINII.

FROM seed-beds of the dwarf varieties of *Pinus montana* one may frequently select some exceptionally compact or slow-growing form that is suitable for the rock garden. These are usually obtained from *P. montana* var. *pumilio*, Willk., and one occasionally meets in cultivation forms of this which have not exceeded three feet or four feet in height, but Mr. B. H. Slavin, Superintendent of the Parks at Rochester, New York, has found a form which was raised from imported Bulgarian seed of the variety *P. m. Mughus*, which is so distinct in habit that it is worth recording. This variety—*P. m. Mughus* forma *Slavini*—has made a prostrate mat only eight inches to twelve inches in height, with a present diameter of

FIG. 75.—KNIPHOFIA UVARIA VAR. SAUNDERSII AT THE ROYAL GARDENS, KEW.  
(see p. 141).

to conclude with a brief summary of the main points which have come under review.

In early ages every country had its solar myth. In Babylon it centred around Dumuzi and Ishtar; in Egypt around Osiris; and in Phoenicia and Greece, around Aphrodite or Venus and Adonis. They represented the decay of Nature, and, as the people of these lands intermixed, their legends were compared and assimilated. Thus Tammuz became one with Osiris and Adonis, and the festivals of one were celebrated as were those of another. At these festivals, symbols of the fleeting character of things, under the title of Adonis Gardens, consisting of flowers, herbs and vegetables, cereals and even cakes made of meal, honey and oil, were used. When the Jews departed from the strict Semitic worship they adopted that of Tammuz or Adonis. They wailed and lamented for the dead god. Thus Ezekiel sets forth his vision of the women weeping for Tammuz, Jeremiah warns against lamenting for Adonis and his lady, and Isaiah shows the folly of turning to the Gardens of Adonis as a substitute for "the Rock of our Salvation." *Hilderie Friend.*

as the "Threepenny-Bit Rose." A sixpence well represents the size of the flowers of *R. graciliflora* in the majority of its forms, and the lesser coin fits those of this smaller species.

It is a remarkable plant at all seasons. The young shoots are so densely covered with prickles and setae that they remind one of some furry caterpillar with a waxy-grey body and rose-coloured hair. Before the flower buds open the whole bush seems set with coral beads. The open flowers are of a peculiarly soft, warm pink, which the light golden anthers cause to glow in the same way as in the larger flowers of that beautiful old Briar, *Rosa Andersonii*. The leaves are so small and delicate in outline that the bush has a dainty, finished look peculiarly its own, not only when the grey-green of young leaves sets off the salmon-pink flowers, but again, when touches of purple and crimson appear in autumn along with the brilliant coral-red of the tiny hips.

At first, I hoped this Rose would remain dwarf and be suitable for a good place in a rock garden. It has, however, thrown up strong shoots that arch out above my head; and to do it justice

over four feet. The photograph (Fig. 74) was taken in 1920, when the plant was fifteen years old and three feet in diameter. *Murray Hornibrook.*

## NOTES FROM KEW.

THE weather conditions have been by no means favourable at Kew for early flowers out-of-doors since the first week in January. *Rhododendron mucronulatum* was at that time covered with a few open flowers and very many flower buds, but frosts, snow and biting north-east winds have frustrated several subsequent attempts of the later flowers to open. Protected by a glass frame and a mat at night, a bush of the white form of *R. moupinense* is flowering freely in a sheltered position near King William's Temple. Though well set with flower buds, *R. Nobleanum* is later than usual this year. Just a few half-developed flower trusses were showing colour a month

ago, several of the more forward were damaged and the remainder held in check by the cold.

The most showy Witch Hazel at the time of writing is *Hamamelis japonica* var. *Zuccariniana*. Several trees seven to eight feet high are covered with the pale lemon-yellow blossoms, forming a pleasing contrast to the rich yellow flowers of *H. mollis*, *H. japonica* and *H. j.* var. *arborea*.

On a wall, and in the open border, *Garrya elliptica* is attractive, laden with large numbers of greyish-green catkins up to five inches or six inches long on the male plants, and about half as long on female bushes. This *Garrya* is a very useful evergreen shrub, apparently hardier than is generally supposed, or is it that during recent years the winters have not proved so trying for this, and other Californian plants? Not being easy subjects to transplant, it is desirable to cultivate small *Garrya* plants in pots until ready for planting in their permanent positions.

It is questionable if we value fully as an evergreen bush the *Laurustinus* (*Viburnum Tinus*) in its numerous varieties. Free in growth and valuable for half-shaded positions, it is not only useful in the shrubbery border, but is one of the best evergreen shrubs to plant beneath deciduous trees. In the open the *Laurustinus* is a valuable winter-flowering bush, lasting in beauty more or less from November to March. It is worthy of consideration as a hedge of a not too formal character. Few shrubs are more readily propagated by cuttings inserted in late summer or early autumn under the shelter of a west wall, and covered with a hand-light or cloche.

Several of the evergreen Chinese Barberries are proving valuable and distinct additions to our pleasure ground beds and borders. Among them the neat, upright habit of *Berberis Gagnepainii* singles out this species for planting as a hedge when one of moderate size and distinctive habit is required. Its compact growth, rich dark green leaves with undulated margins, and abundant spines, are singularly attractive. For the rock garden and groups in the foreground of beds and borders the dwarf evergreen *B. candidula* is deserving of note. Some three feet in height and more in diameter, the bushes are close and compact in habit, with dark shining green leaves, conspicuously blue-white beneath. This distinctive colour was no doubt responsible for the title of *B. Wallichiana* var. *hypoleuca*, the name by which we first grew it. The bush, however, is sufficiently distinct from that species to merit the distinctive name of *B. candidula* given by Schneider. Quite the opposite in point of growth is the tall, loose habit of *Berberis Veitchii*. The lance-shaped, spiny leaves, up to six inches long, are among the largest of the true evergreen Barberries. It was first introduced by Messrs. James Veitch and Sons as *B. acuminata*, a species collected by Delavay in Central China in 1882, and named by Franchet. Schneider, however, considers Wilson's plant, collected in Western Hupeh in 1900, as quite distinct, and described it as *B. Veitchii*. Another new Chinese species, *B. atrocarpa*, has light green leaves, one-and-a-half to three inches long, the spreading bushes five feet to six feet tall and pleasing in appearance.

The hybrid varieties of the Swiss Heath, *Erica carnea*, furnish, perhaps, the brightest colour in the out-door garden, for frost, snow, wind and rain cannot dim their dainty blossoms. From December to March the rosy-red blossoms on the compact little bushes are delightful. From six to nine inches high, the plants spread with age to a width of eighteen inches or more, though when they attain this size they are inclined to become ragged and are better replaced by young plants. Described as Potter's Hybrids or Backhouse's Hybrids, the best of the dozen or more named sorts are King George V, *præcox rubra* and Mrs. Sam Doncaster.

Two Chinese *Pyracanthas* are very attractive by reason of their highly-coloured fruits. *P. Gibbsii* var. *yunnanensis*, being perfectly hardy, is the more valuable. The fruits are light red in colour, not quite so large as those of *P. Lalandii*, but very freely produced. Flowering some three weeks later than that species the fruits are much later in ripening, and usually hang on the bushes untouched by birds until

March. Except in the south and west, the protection of a wall is desirable for the less hardy *Pyracantha angustifolia*. In this case, the fruits are rich orange and very attractive, disposed freely among the evergreen leaves.

Being evergreen, the *Pyracanthas* are not easy to transplant in the open ground. For this reason it is desirable to cultivate the plants in pots until ready for planting in their permanent positions. *A. Osborn.*

## ORCHID NOTES AND CLEANINGS.

### CALANTHES AT NETHER WARDEN.

THE late Mr. Norman Cookson and Mrs. Cookson, of Oakwood, Wylam, probably did more than any one else to develop the cultivation of *Calanthes*. Their success as hybridists is well-known and need not be recounted, except for a brief reference to the two last hybrids raised in that collection, i.e., *C. Angela*, in which the whole of the flower, excepting the white disc on the labellum, is a rich purple, and *C. Ruby* var. *Cooksoniae*, a pure white variety which is considered the finest in substance and form of its race. Each of these was awarded a First Class Certificate when exhibited at the meetings of the Royal Horticultural Society at a time when *Calanthes* were not altogether in favour.

Last year I had the privilege of sending *The Gardeners' Chronicle* a few notes on Mr. Clive Cookson's garden at Nether Warden, Hexham, and stated then that many seedling *Calanthes* were flowering for the first time. I have been able to see the plants again in a more vigorous state, and was so impressed that I thought a further note desirable. Mr. James O'Brien recently recorded *C. Hexham* Pet (*C. Angela* × *C. Bryan*). There were some two dozen plants of this cross in flower, and they are a most remarkable set. In most cases the flowers resemble those of glorified varieties of *C. Bryan* and *C. Wm. Murray*, in form and colour; others were of pink shades suffused with rose: in only one instance was the colouring of *C. Angela* at all evident. This hybrid may best be described as a purple *C. Bryan*. The larger, deep rosy-purple flowers have their petals reflexed as in that variety; the sepals are of a lighter shade, and the lip is rich plum-purple altogether darker than the colouring seen in *C. Angela*.

The second hybrid Mr. O'Brien recorded was *C. Hexham* Lad (*burfordiense* × *Angela*). It is the variety *C. Hexham* Lad var. *Richard* which is of the greatest interest, for this is a plant carrying fifteen flowers which are in every way superior to those of *C. Angela* in colour, while the individual blooms are about the size of those of *C. Ruby* var. *Cooksoniae*. The flat lip is deep blood-red, excepting the white disk. The sepals are of similar colour and the petals slightly redder and of good form. This is the finest *Calanthe* I have seen, and I congratulate Mr. Clive Cookson and his gardener, Mr. Stables, on their success. *H. J. C.*

## INDOOR PLANTS.

### JASMINUM PRIMULINUM.

THIS Chinese Jessamine is a very valuable winter-flowering subject for the cool greenhouse. A native of Yunnan, it thrives out-of-doors in very sheltered gardens of the south and west, but otherwise can only be considered a greenhouse plant, being insufficiently hardy for cultivation on a warm wall in the London district.

It is, perhaps, seen to the best advantage trained to the pillars of a large greenhouse or conservatory. Close pruning at the end of March each year, after flowering, induces the production of vigorous, young shoots. These grow to a length of several feet, and if well-ripened, are wreathed in a succession of large, yellow blossoms from Christmas to March.

Where space permits, it is surprising how attractive *J. primulinum* is growing in a hanging basket. A specimen in the Temperate House

at Kew, hanging in one of the octagons, is an object of great beauty. Hard pruning each year after flowering induces the production of many new shoots which, at the present time, clothe the basket and are festooned with yellow blossoms. *A. Osborn.*

### ACOKANTHERA SPECTABILIS.

THIS *Acokanthera* is an excellent subject for the intermediate or stove house. It is a native of the western regions of South Africa and was first flowered in this country in 1872.

The plant is of a shrubby habit and bears elliptic leaves of deep green colour and is quite glabrous except for a slight hairiness of the inflorescence.

The flowers appear in January or early February and possess a delicious fragrance, very much resembling that of Lilac. They are borne in dense, axillary, branched cymes, and are pure white, somewhat resembling in appearance the inflorescence of *Ixora*.

This plant has very poisonous properties, being very closely related to *A. venenata*, the "Gift-boom" or "Bushman's Poison" of the South African settlers. From this latter plant the natives extract a substance for poisoning their arrows. *Acokanthera spectabilis* is figured in *Bot. Mag.*, tab. 6359. *T. H. Everett.*

## TREES AND SHRUBS.

### SHRUBS FOR LARGE LAWN BEDS.

MANY kinds of shrubs are ideal for filling large, or even small, lawn beds, and it is surprising how this class of plant has been neglected for such purpose; too often they are jumbled with other plants in a mixed border, where they have no opportunity of showing their full beauty.

Given space to develop, many shrubs make fine individual specimens for the lawn, and should be grown as such where there is no space to plant beds of them. *Forsythia suspensa*, *F. intermedia* var. *densiflora* and *F. intermedia* var. *spectabilis* are three beautiful spring-flowering shrubs suitable for the purpose; the last-named being the best.

*Philadelphus Virginalis* is very fine for a large bed, other good varieties being *Bouquet Blanc*, *Rosace*, *Voie Lactee*, and *purpurea-maculatus*, which is worth growing for its spicy fragrance alone. There are many beautiful Barberries of recent introduction from China worthy of a place in any garden, but I doubt whether any of them is so useful or beautiful for the purpose as the older *B. Darwinii* and *B. stenophylla*.

Other good subjects for furnishing large beds are *Buddleia variabilis* var. *magnifica* (syn. *Veitchiana*), *B. globosa*, *Cytisus albus*, *C. præcox*, *C. Dallimorei* and the many beautiful varieties of *C. scoparius*. *Hamamelis arborea* and *H. mollis* should be included for their winter-flowering, the blooms of the latter being deliciously fragrant. Many of the *Magnolias* make fine specimens; *M. stellata* is specially suitable for filling a bed in a sheltered position, as it is very fragrant and flowers so early. *Prunus triloba* fl. pl., often seen trained on a wall is also fine in the open. *Pyrus floribunda* var. *atro-sanguinea*, *P. purpurea*, and *P. Scheideckeri*, are all excellent for planting singly or in large masses. *Rhus cotinoides*, *R. Cotinus* and its variety *atropurpurea*, as well as *R. typhina* and its variety *laciniata*, are all worth planting for their foliage effect. *Ribes sanguineum* var. *splendens*, *Rubus deliciosus*, *Spiraea Aitchisonii*, *S. arborea*, and *S. discolor* (syn. *ariaefolia*), are also useful for the purpose.

*Tamarix pentandra*, which is more generally known as *T. hispida aestivalis*, is very beautiful and should be pruned hard back every spring. *Viburnum Opulus* var. *sterilis*, *V. plicatum* and *V. tomentosum Mariessii* are all handsome shrubs; also some of the better varieties of *Diervilla* (syn. *Weigela*). Planters should make a more intelligent use of this beautiful class of plants which, although seen in many gardens, are seldom displayed to the best advantage. Young specimens of these shrubs may still be planted in carefully prepared sites. *J. Coult.*

## Seed Trays of distinction

Please quote reference H.D.

**GEO. MONRO LIMITED**

Sundries Department

4 Tavistock Street, London, W.C.2

The G.M.L. mark of seed trays has established something of a reputation within the last few years. They are specially imported Redwood, cut by mills who put defective boards in the furnace. The trays are made up in the same careful fashion as the Monro Tomato Box, and share with this the reputation of "the best on the market."

Quality tells in the long run, even in Seed Trays, and we have contracts for upwards of half-a-million sets—say 3,850 gross—for the present season.

Stock is on hand at Waltham Cross and open to inspection. We are thus in a position to execute orders as soon as received, and before the Tomato season work is needed for the factory plant.

Particulars of standard sizes as follows:—

Inside Dimensions.

$14 \times 8\frac{1}{2} \times 2$

$14 \times 8\frac{1}{2} \times 2\frac{1}{2}$

$14 \times 8\frac{1}{2} \times 3$

We shall be happy to quote prices on receipt of particulars as to quantity.

Lowest Rates by rail are in force for a 2-ton lot of sets or a truck-load of made-up trays. By rail the made-up trays travel much better in whole truck-loads, of course, as this saves handling and mixing with other consignments.

It should be noted that the dimensions quoted are inside measurements. Add one inch to the length and half-an-inch to the breadth to arrive at 15 in.  $\times$  9 in., commonly quoted in the trade. In additions to trays of these dimensions, a large stock is on hand of other sizes up to 4 $\frac{1}{2}$  in. deep, up to 11 $\frac{1}{2}$  in. wide, and up to 17 in. long, at proportionate prices.

## FLORISTS' FLOWERS.

### DOUBLE WALLFLOWER EARLY WONDER.

AFTER many years of careful effort, Mr. Ernst Benary, of Erfurt, succeeded in obtaining an annual, double-flowered Wallflower. This interesting variety was exhibited at the meeting of the Royal Horticultural Society on June 29, 1926, when the Floral Committee granted it an Award of Merit. The plants and flowers then shown were described under the title of "Double-flowering Annual Wallflower" in our issue of July 3 of that year, when reference was made to the "rather dingy brown" colour of certain forms. Later, Mr. Benary brought specimens and coloured figures of this new introduction to our office, and these proved that brighter hues were available.

A week or so ago Mr. Benary wrote us stating that "plants raised from seeds sown in July, 1926, commenced to flower in a greenhouse in November, and continued to bloom through the winter. The photograph enclosed (Fig. 76) was taken in one of our greenhouses at Erfurt on February 1 this year."

This new annual double-flowered Wallflower, now named Early Wonder, should prove valuable for the decoration of the warm greenhouse or conservatory during the winter, and if successional batches of plants are raised, the flowering period could be extended indefinitely.

### SWEET PEAS.

If Sweet Peas are required to bloom very early, that is in June and July, the plants should be raised in September and October, wintered in frames or a cold greenhouse, and planted out about the end of March. If required for ordinary summer flowering from, say, the middle of July onwards, it is best to sow the seeds in January or February, and plant out the seedlings after they have been hardened, early in April. Those who, for any reason, such as lack of frames or a cold greenhouse, find it inconvenient to sow the seeds in autumn or in January-February, may sow in the open from the end of March onwards. Successional sowings made at intervals of a fortnight or so, from the middle of April to the end of May, will extend the flowering season well into the autumn up to such time as frost cuts the plants down.

In all cases it is best to sow the seeds in pots or boxes filled with light, porous soil, placing them about one-and-a-quarter-inch deep. Place three seeds, triangular fashion, in a three-inch pot, about an inch apart and the same distance from the side of the pot. When sown in boxes the same procedure should be followed, but in this case it is as well to allow a full two inches between each seed, and a similar distance between each row, allowing two inches also between the sides of the boxes and the nearest seeds.

The practice of chipping Sweet Pea seeds is not to be recommended, except in very special cases. Some of the best Sweet Pea growers of late years emphasise the fact that only very hard-coated seeds should be chipped. If white and wrinkled seeds are chipped it generally means that they rot instead of grow.

It is of the utmost importance that, so long as Sweet Pea seeds remain in their pots or boxes, plenty of air be admitted to the frames or greenhouse; but so soon as the seedlings appear they should be protected from excessive moisture, for with an excess of wet at the roots they will be liable to injury from frost. On no account should germination or growth be hastened by artificial heat. When four pairs of leaves have formed, stop each plant once, and after a little further progress has been made, if specially sturdy or exhibition plants are required, transfer them singly to three-inch pots. It is a good plan, when the seeds are sown in pots, to plunge the latter in soft, friable soil to a depth of two or three inches, in frames, where these are available. This not only keeps the pots steady, but facilitates watering, and also tends to keep the temperature of the soil in the pots more even than where the latter are stood on a hard surface or on the greenhouse bench.

Another very important point in connection with the culture of Sweet Peas is to give due consideration of the site in which the plants are to be grown. An open, sunny situation is always desirable, provided it is not exposed to high winds or driving rain.

Staking is another highly important matter. When the seedlings are transplanted, the plants should be at once supported carefully by small twigs of sufficient height to carry them safely upward to a height of at least twelve to eighteen inches, after which the plants should be sufficiently strong to attach themselves to tall

with green manure and a little fine soil or bonfire ash. In such cases a light dressing of lime may be applied; soils in which Sweet Peas are to be grown should contain at least two per cent of lime. Nitrogenous manures in any form are harmful when applied in excess, and are liable to predispose the plants to disease. Heavy ground may be dressed in the autumn with 7 lb. of basic slag per square rod, and 2 lb. of sulphate of potash in the spring. In the case of light soils, there is no necessity to use basic slag; such land may be dressed in spring with 4 lb. of superphosphate of lime and 2 lb.

FIG. 76.—DOUBLE WALLFLOWER EARLY WONDER.

Pea-sticks. To interweave the long stakes in double rows, so as to really interlace and support one another, is the essence of good and successful staking.

I cannot too forcibly urge the importance of early trenching and the proper preparation of the ground wherein the seedlings will be transplanted. Take out a wide trench and place the top soil on one side. Next, remove and discard the subsoil to a depth of twelve inches, and after breaking up the bottom of the trench with a fork, substitute an equal quantity of short, well-decayed manure, rotted leaves, old potting soil, or any other suitable material that may be available. Finally, return the top soil to its original position. In place of the farmyard manure leaf-mould may be mixed

of sulphate of potash. In many instances, however, it may be found more convenient to use a "complete" fertiliser, prepared expressly for Sweet Peas. A dressing of dry wood-ash, well-raked in the soil a little in advance of planting, is of great value.

Outdoor sowings are often made in August or September where a warm soil and favourable situation can be ensured, but the Sweet Pea is liable to attack from slugs and sparrows, against which special precautions must be taken, not only from the moment the seedlings appear, but even beforehand. Against the slug the usual precautions should be taken, such as the use of ashes, old soot, lime and slug-traps. The sparrow is more difficult to cope with. Half-inch Pea-guards are generally

effective during the earlier stages, if closed at both ends. Black cotton, too, is sometimes useful, but not reliable.

To obtain blooms for exhibition purposes, Sweet Pea plants should be trained as upright cordons on Bamboo canes or tightened cords, all side-shoots being taken out. Leave two strong basal growths on each plant. These, when trained up the supports will produce long, stout stems, mostly carrying four blooms to the spray—a spray being defined, for exhibition purposes, as "the flower scape or stem alone, with no portion of main or lateral growth attached."

It is not always realised what a difference the simple act of cutting Sweet Pea flowers properly or improperly makes in the show of bloom, or longevity of the flowering season. To merely tear or break off the stalks or stems from the haulm does serious injury to the plant. Picking off all seed-pods before they approach maturity is likewise of the utmost importance in regard to lengthening the flowering season, for the simple and obvious reason that the formation of seeds greatly reduces the plant's vitality. An occasional dusting of lime and soot, well mixed in almost equal parts and allowed to stand until the caustic properties of the soot have disappeared, in showery weather, will do much to keep away slugs, improve the colour of the foliage, promote growth generally, and also act as a preventive of mildew.

As early in April as possible, all plants not sown in the open should be placed in their flowering quarters. The exact date will depend on weather conditions. Place a line along each row and mark off every twelve inches by means of twigs or old garden labels. If exhibition flowers are desired, allow eighteen inches. Some growers prefer single rows, but for producing cut blooms for ordinary purposes I have found that a double row is preferable, the plants being put out alternately about nine inches apart. Begin planting by making a hole with a trowel, big enough to take one plant only; turn the pot in which the plant is growing singly, or otherwise, upside down and knock out the ball of soil entire. This may easily be done if the plants are well watered the day before. Place each plant carefully in its hole, with the roots comfortably separated, and fill around the latter with fine, dry, sifted soil, lightened with a fair quantity of fine sand. Fill the hole carefully and press the soil firmly on every side, leaving a slight depression to act as a cup to facilitate an immediate watering when the row is completed. This method of planting has a further advantage in that it enables the gardener to arrange his Sweet Peas tastefully, according to a prearranged colour scheme. When the rows are planted, there should be a decided trough-like depression from end to end, with well-defined banks of earth on each side to retain water when it is supplied in dry weather. In May to June, if the weather is dry, the plants will be greatly benefited by a liberal watering once or twice a week. At the end of May, mulch or top-dress the roots with well-decomposed manure or spent Hops, over which a light dressing of the lime and soot mixture may be added. *E. A. Saunders, Compton, Sussex.*

## A WILT DISEASE OF THE CARNATION.

DURING 1926 some young Carnation plants were received at the Cheshunt Research Station which were attacked by an apparently new disease. No record can be found of its previous occurrence. Up to the present only a little work has been done, and this note is issued so that Carnation growers may be aware of its existence and keep a look out for its appearance.

The plants were about four months from the cutting stage, and showed signs of wilting, generally presenting a stunted appearance. The inside of the wilted stems was brown at the base, infection most probably having taken place below soil level. Both the pith and the wood were diseased, the wood being browned for a considerable distance up the stem.

Two fungi were isolated from the diseased

tissue, but only one proved to be pathogenic, and inoculations into the stems of healthy Carnation plants were always successful. The fungus was easily re-isolated from the diseased tissue following inoculation.

The fungus has not been fully identified, but is probably an *Altenaria* sp.

Young shoots of healthy Carnation plants were inoculated in December, and complete wilting occurred after a period of thirty-six days. When the older stems were inoculated complete wilting took a much longer time, namely, sixty-one days; stunting of the younger and more distal shoots on these inoculated stems was observed after a comparatively short period. Young shoots inoculated in January exhibited complete wilting in twelve days.

When healthy Carnation plants were sprayed with a spore suspension of the fungus and kept in a humid atmosphere for two days, pale, circular, discoloured areas, with black centres, appeared on the younger leaves and stems. These areas have a close resemblance to those caused by *Altenaria Dianthi*, S. and H. In one case a freshly cut stem was exposed to infection by spraying with a spore suspension. The inoculated stem died back and young shoots growing away from the stem became stunted and eventually wilted completely.

Experiments on the rate of growth of the fungus, in pure culture, at different temperatures have been carried out. The optimum temperature appears to lie between 73°F. and 77°F., the fungus, however, grows reasonably fast at 68°F.

It might be supposed that the fungus is *Altenaria Dianthi*, S. and H., but the mode of infection and size of spore are important differences. The size of the spores of *Altenaria Dianthi* is given \*as  $26\mu-123\mu \times 10\mu-20\mu$ , whereas the spores of the fungus in question are  $26\mu-103\mu$ —long and  $13\mu-38\mu$  wide, the latter being shorter and wider. *Wilfred Corbett.*

## MARKET FRUIT GARDEN.

ALTHOUGH the rainfall of January was below the average (2.32 inches at my place), it seemed to be a wet month, because a certain amount of rain fell on all except eight days. The frequent showers, often accompanied by strong wind, made it a bad month for spraying. However, some progress was made with this work, and there is now no doubt that it will be finished in good time. Whenever spraying was impossible, the skilled hands turned to pruning and the rest to the grubbing of overcrowded trees. It has fortunately been possible to keep ahead of spraying with this last job, thus economising wash and facilitating the work. The increased space for getting about amongst the trees with hoses and lances has been much appreciated, and has led to more efficient spraying. The work of grubbing is now drawing to a finish. It has proved rather formidable, not because the trees take long to uproot, but because there is such a lot of wood to clear away. The stems and larger branches are, of course, saleable as firewood; but the smaller stuff is dragged to the nearest headland and burnt on the spot. I have always found that the price realised for faggots is insufficient to pay for the tying up, at any rate, in a district where better faggots are obtainable from the woods. Moreover, it seems safest, in view of the risk of spreading fungous diseases, to get the stuff destroyed promptly.

### PRUNING.

There is still a lot of pruning to be done, and I suppose, as usual, some trees will not receive attention. It is, perhaps, the most trying feature of fruit-growing for market that one cannot afford to have everything in perfect order. So many jobs should have attention at one time, and it is impossible to keep a staff big enough to deal with all. To get all

\* *The Fungi which cause Plant Disease*, by F. L. Stevens. Macmillan, 1913.

my pruning done at the proper time it would be necessary to have six or eight men doing nothing else during the whole dormant period. But this would mean a separate gang of half-a-dozen for spraying and planting. As it is, spraying has to have first claim whenever the weather is suitable, for this must be completed at all costs. It is futile to get the other work done and then to be robbed of a crop by pests and diseases. Pruning has to be carried on until the trees are near blooming and spring work claims attention. The ideal plan would be to get all pruning finished before winter spraying. In a regular fruit-growing district this may be possible, as there are men accustomed to the work who can be taken on temporarily. This is not the case in my locality. Men have to be taught to prune, and by no means have all either the aptitude or the inclination.

Many of my trees are Apples on the free stock. For very many years after the heads were properly formed, they needed nothing beyond thinning out, this being the best way to bring the trees into bearing quickly. Now, however, all except the most vigorous varieties have grown to a stage at which it is necessary to return to more drastic pruning in order to keep them moving. This means leader-tipping, or in some cases more severe heading back, in addition to thinning out; and the extra time needed is surprising. Many of the largest trees take nearly an hour each to prune. There is a great difference in varieties in this respect. Bramley's Seedling gives least trouble, as it seldom needs more than a trifling amount of thinning out, and hardly ever any tipping at all. It notoriously does best when left almost to itself. As a striking contrast there is Allington Pippin, which every year is crowded with shoots which must be spurred or cut back to fruit buds. Even more time, however, is taken by trees which show a lot of diseased wood, as is often the case with Cox's Orange Pippin. This winter I find that this variety and some others have more canker than has been seen for many seasons, whilst the winter stage of scab on the young shoots is unusually prevalent. All canker wounds have to be pared out and painted, and scabby wood cut off and burned.

Young trees are quickly pruned and should, of course, never be neglected; but they call for more skill than older trees if a good foundation is to be built up. Here again the treatment must be modified to suit the variety. One of the most pleasant to prune is Rival, which is naturally shapely, and, in spite of its strong growth, very readily forms natural spurs if not cut too hard. Early Victoria is also easy to prune, though it requires quite different treatment. Owing to its extremely fruitful habit, it may have all the laterals fairly closely spurred every year, whilst the leaders need tipping annually to keep the tree growing. With many varieties, if on the free stock, such pruning would delay bearing almost indefinitely, but not so with Early Victoria. One of the most tiresome to prune is Beauty of Bath, owing to its habit of making an unbalanced head, especially if in an exposed position. This is one of the most tender varieties and seems to be more sensitive than others even to wind. To correct the unbalanced head I find it best to shorten the strong shoots on the taller side of the tree, or even, in extreme cases, head them back to a weaker lateral, and leave the shoots on the weaker side of the head full length. If the pruner follows the old book direction, and cuts the weak shoots more severely than the strong ones, the head becomes more unbalanced than ever. This idea dies hard. Pruning promotes new growth, it is true; but, at the end of the year, the total length of the shoot is greater if it was not pruned than if it was. At one time, when trees began to run away at the tops at the expense of the shoots round the bottom, as some will, I used to prune the latter with the idea of stimulating growth and inducing them to catch up to the top growths which were not pruned. I found, however, that exactly the opposite result was obtained, and the tree rushed upwards more than ever. It has since been shown in pruning experiments that trees which do not have their leaders tipped grow bigger than if they are tipped, at any rate, until the earlier fruiting

induced by non-pruning begins to have a dwarfing effect.

#### PRESSURE IN SPRAYING.

Plenty of pressure is an important point in spraying. Several growers have recorded that they get better results from tar-distillate wash when applied with a power sprayer than when a hand machine is used. I have noticed the same thing. All my older plantations are sprayed with a power outfit, but a good hand sprayer is used for younger trees. The result is not quite so good in the latter case. The control of aphids is complete, but rather more caterpillars survive. I have just had another lesson in the importance of pressure. At the beginning of the spraying season my power sprayer was not giving its full pressure, owing to some defect. The pressure was only round about 100lb per square inch. After a time the man in charge managed to put the matter right, and even got the machine to deliver at higher pressure than it ever has done before, namely, 250lb. As a result the trees were made very much cleaner by the spraying, and the work proceeded at a greater pace, owing to the wide and powerful cone of spray produced. On visiting what is probably the best fruit farm in this country, a few years ago, I was surprised to see a spraying machine working at over 300lb pressure and found that the grower attributed to this fact much of his marked success in controlling pests and diseases. He was able to obtain complete control of aphides by the use of nicotine without the addition of soap, a thing which I have never been able to do. *Market Fruit Grower.*

### VEGETABLE GARDEN.

#### A SUCCESSION OF CAULIFLOWERS.

THE Cauliflower is one of the most important crops of the vegetable garden, and many gardeners are required to produce a constant supply of heads at all seasons of the year.

To ensure a succession all the year round, it is necessary to rely on what are generally termed Broccoli, which are really only hardy varieties of the Cauliflower, the true Broccoli being the Sprouting Broccoli, of which there are both white and purple forms.

The soil for Cauliflowers, both as regards firmness and richness, should vary according to the season when the plants mature; those that do not have to withstand the winter should be planted in fairly rich soil to ensure that the plants make quick growth. On the other hand, varieties required to withstand the winter should be planted in very firm ground, but not too rich, and preferably land from which a crop has just been cleared. No digging is needed or other preparation of the ground, beyond cleaning the surface of weeds.

For the earliest supplies a sowing should be made about the first week in September in the open, the seedlings wintered in frames and planted out about the end of March or early April, or even earlier if some protection can be given the plants until the weather is favourable.

If desirable, a percentage of the plants from this batch may be matured in frames. A valuable variety for this purpose is Feltham Forcing.

Those planted in the open will furnish supplies from early June, the following varieties forming a good succession:—First Crop, an excellent variety requiring very little space to develop, followed by Improved Snowball and Magnum Bonum, for mid-summer, and a little later seeds may be sown under glass early in February and treated as half-hardy annuals, planting out the seedlings when they are thoroughly hardened. Purity and Improved Large Erfurt are suitable for this purpose. During April and early May sowings may be made in the open of the varieties All-the-Year-Round, Eclipse and Autumn Giant, thereby extending the supply well into the autumn. Special mention should be made of the excellent and most reliable variety, All-the-Year-Round.

To continue the sequence, the hardier type is used. These are sown in the open ground at intervals from about mid-March to the

middle of May, according to their season. The varieties Michaelmas White, Veitch's Self-Protecting Autumn and Winter Mammoth will provide heads until Christmas or even a little later, in the order of their names.

For the next three months Early Springtide, Snow's Winter White, Leamington and Knight's Protecting will maintain a succession. It is advisable not to depend on one particular variety for this season, as at this season plants are very slow in forming heads, but much will depend on the weather: frequently Leamington and a few others produce curds over a long period.

Later supplies are much easier to produce, and the heads of these late sorts are much larger and quicker in developing than others. A large number of good varieties may be grown for this purpose, amongst them April, Preston White, Cattell's Eclipse, Edinburgh Market, Edmonton and Late Queen.

Latest supplies may be obtained by growing Methuen's June, which will form the connecting link with the earliest varieties. It does not follow that all these varieties are necessary, or do equally well in all localities, but they offer a selection from a large number grown at Wisley under identical conditions on two separate occasions. It will be noted that a good number are old varieties, which seem to hold their own in competition with those of more recent introduction. *J. Wilson, Wisley.*

### FRUIT REGISTER.

#### PEAR CHARLES ERNEST.

ALTHOUGH this Pear is not quite of the first-class, it is well worth planting, for the somewhat large fruits possess white, melting flesh, are very sweet and well-flavoured, and moreover, the tree is fertile and hardy.

The fruits are large, something after the style of those of Pitmaston Duchess, oval-pyriform in shape, and coloured yellow, with a faint red flush.

Of upright growth, the tree makes an excellent bush, or it may be grown as an espalier or cordon.

This Pear is in season from October to November; it was introduced by a French firm of nurserymen somewhere about 1880.

#### APPLE THE QUEEN.

THIS excellent culinary Apple has much to recommend it: it makes an excellent bush or pyramid on the Paradise stock and is a regular, if not a heavy, cropper.

The fruits are large, flat and extremely handsome; yellow, boldly striped rosy-red. The flesh is white and of rather acid flavour. The variety is in season from October till December. It is an excellent cooking variety and grand for exhibition. It was introduced by Mr. Saltmarsh in 1880 and is often listed as Saltmarsh's Queen. In the year of its introduction it received the First Class Certificate of the Royal Horticultural Society. It makes a very good orchard tree for home purposes, but owing to its soft flesh it is not very valuable for commercial purposes. *Ralph E. Arnold.*

#### PEAR BELLE JULIE.

THIS fine Pear was raised by Van Mons close upon one hundred years ago and named after his granddaughter. The variety is noted for its excellent cropping qualities.

Although its season is October-November and therefore coincides with some of the best varieties, it is, nevertheless, worthy of inclusion in a collection. It was one of the very few varieties that cropped freely at Wisley in 1925, having also cropped the year previously, and it again fruited heavily in 1926. Of upright growth, it makes a good bush. It is rather late to bloom, and the blossom is extremely pretty in the bud stage, being a delicate pink. The fruit is of medium size (rather inclined to come small if not well thinned), oval, even and regularly shaped; the eye is very distinct. The colour is a dull brown russet with a very slight flush.

Of good flavour, this Pear has the merit of rarely rotting in the centre. *J. Wilson, Wisley.*

### HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Deep Trenching.**—Much has been written, and doubtless much more will be written, on the subject of trenching. Various opinions are expressed as to the methods followed by well-known gardeners. To my mind, the reason there are these differences is that there are so many different soils, and to treat all alike would be to court disaster. I have had exceptional experience with soils, and I am of the same opinion as *G. D.*, when he questions Mr. Beckett's advice to bring the subsoil to the top, and I will go so far as to state that Mr. Beckett would not do so in a garden with a subsoil of yellow Sussex clay only a foot from the surface and with very little in the way of manure or leaf-mould at his disposal. I have had charge of a garden with such soil in Sussex and also at Bury St. Edmunds, the subsoil being simply gravel at fifteen inches from the top, and quite useless as top soil. This gravel was so hard that I had to use a pick to break up the bottom; a fork would not enter it. No matter what the subsoil is, it does pay to break it up, but in the great majority of cases it must be left at the bottom. I had a soil at Marks Tey that was the best I have had, with a heavy subsoil, but not clay, as in Sussex. It was possible to grow vegetables on such a soil large enough for any purpose with only ordinary bastard trenching. The soil here, at White Ness, has a chalk subsoil. I am breaking up the subsoil of quite a large piece of ground by bastard trenching, simply to bury rubbish. I think it is wrong to advise all and sundry to bring the subsoil to the top. *W. Parker, White Ness, Broadstairs.*

—I am entirely in agreement with the methods advocated by Mr. Beckett, but would like to add that I would advise further treatment where the subsoil is such as is described by *G. D.* I was previously in charge of a garden where seams of hard, blue clay, exceeded a foot beneath the surface, in fact, the subsoil was of such a nature that if one struck into it with a spade it made little impression. When taking over the appointment, my employer informed me that it had always been a matter of difficulty to get a supply of vegetables sufficient for the establishment. Having inspected the soil, I came to the conclusion that deep trenching, combined with simultaneous cropping was necessary, and accordingly decided to put this into practice, the necessary labour being forthcoming. Every plot was trenched to a depth of two-and-a-half feet to three feet and the subsoil brought to the surface. Lime was applied, also a heavy dressing of ash from the garden bonfire. The treatment was given annually, and every plot was rendered available for growing any vegetable desired. I did not experience a break in the supply after the first year, and the quality of the produce greatly improved. I attributed the success to the application of lime and ashes; everything available was burnt, including as much wood and soil as possible, and the quantity of ashes applied must have amounted to several tons in the course of time. The lime performs a double service, as by its action it not only releases the alkalies, potash and soda, but by rendering the clay more amenable to the fork and rake, ensures a fine tilth for sowing and planting, which otherwise is almost impossible. *G. Robinson, Gannow Hill Hall Gardens, Oswestry.*

**Lathyrus tuberosus.**—The note on this plant by Mr. Briscoe (p. 73) is interesting, as it establishes a new habitat for the plant, which is undoubtedly rare in a wild state in this country. As a garden plant, however, it is not so uncommon. I found a stock of it at Belvoir Castle when I took charge there in 1894, and I left a good stock when I retired in 1917. It is a very graceful plant, and did not travel about in the stiff clay at that place, but was generally admired by all who saw it growing. I do not, however, consider it a suitable plant to place on rockwork. Other species of *Lathyrus* worthy of a place in all herbaceous borders are *L. cyanus*, *L. pubescens*, *L. roseus* and *L. rotundifolius*. *W. H. Divers, V.M.H.*

## SOCIETIES.

### ROYAL HORTICULTURAL.

FEBRUARY 22.—A particularly bright exhibition greeted the Fellows and visitors who attended the Royal Horticultural Society's Hall on this date. Spring flowers were very much in evidence, both Daffodils and Tulips, as well as gently forwarded alpenes and hardy shrubs contributed to the attractions. Cyclamens were particularly well shown, Messrs. SUTTON AND SONS' fine display filling one end of the hall. Carnations provided an attractive feature, as did the Camellias from Devonshire. Orchids, though fewer than at the previous meeting, were shown freely.

Novelties were few in number, the Orchid Committee granting three, and the Floral Committee three Awards of Merit.

We were glad to notice that one table had been set aside for the display of rare and interesting plants amateurs may like to show. We hope advantage will be taken of this opportunity.

#### Orchid Committee.

*Present*: Sir Jeremiah Colman, Bt. (in the chair), Mr. R. Brooman White, Mr. Fred J. Hanbury, Mr. Flory, Mr. A. Dye, Mr. H. G. Alexander, Mr. F. E. Shill, Mr. Fred K. Sander, Mr. Stuart Low, Mr. Wilson Potter, Mr. R. Ashton, Mr. T. Armstrong, Mr. H. H. Smith, Mr. J. Cowan, Mr. Chas. H. Curtis, Mr. A. McBean, Mr. H. T. Pitt and Mr. Gurney Wilson (Hon. Sec.).

#### AWARDS OF MERIT.

*Dendrobium Renown* var. *Armstrongiae* (nobile var. *Sir F. W. Moore* × *Queen of Gatten*).—One of the most richly-coloured *Dendrobiums* we have ever seen. The flowers are of fine form and good size; sepals and petals deep purple; lip deep rose-purple with a large purple-brown throat surrounded by a ring of palest buff. Shown by Messrs. ARMSTRONG AND BROWN.

*Cymbidium Erica* var. *Orbis* (*grandiflorum* × *Pauwelsii*).—A large-flowered form with light green sepals and petals of excellent substance; lip white with brown markings on the green-tinted margin. A very effective Orchid. Shown by Messrs. SANDERS.

*Cattleya Prince Shimadzu* var. *Springtide* (*Titus* × *Hardyana*).—A lovely Orchid with broad white petals and narrower sepals; the wide, flattish lip is light yellow, with purplish Picotee-edge and bright, light purple stains on the white ground of the apical portion. The flower shown was of large size and fine substance. Shown by H. T. PITT, Esq., Rosslyn, Stamford Hill.

#### GROUPS.

A bright and attractive group from Messrs. CHARLESWORTH AND CO. arrested attention by reason of the numerous arching spikes of *Odontoglossums* it contained; a few of the best of these were *O. Cordoba*, *O. Prince Edward*, *O. citrinum*, *O. oximium*, *O. Toreador* and *O. Eros*. *Miltonia Lyceana* was shown in fine style, as were *Laelio-Cattleya Serbia*, *Wilsonara Wendy*, *Odontodia Monica* and *Cynorchis Lowii*—this last being rarely seen nowadays.

In the group submitted by Messrs. J. AND A. McBEAN, *Laelio-Cattleya Arcturus* and *Odontodia Bradshawiae* were particularly fine in colour; other good things were *Cattleya Cowanii alba*, *Laelio-Cattleya Arcturus*, *L.-C. Linda*, *L.-C. Eunice* (a *L. anceps* hybrid), and *Odontoglossum Aphrodite*, carrying a spike of twenty-eight flowers and buds.

H. T. PITT, Esq. (gr. Mr. Thurgood), again contributed an interesting collection, and once more demonstrated his ability to grow and flower *Epidendrum Endresio-Wallisii* finely. Some good forms of *Lycaste Skinneri* were exhibited together with several excellent *Cypripediums*, including *C. Robert Paterson*, *Cattleya Hassallii alba*, *Rosslyn* var., and a selection of fine *Cymbidium*s.

Messrs. SANDERS showed *Cymbidium Erica* Sander in variety, *C. Louis Sander* var. *St. Alban*, the large-flowered *C. Albatross* var. *Verulam*, *Odontoglossum leucorhodum*, the good old *Dendrobium Wardianum*, *Platyclinis glumaceum* and a freely-flowered example of *Masdevallia igneo-Estradae*.

*Oncidioda Stuart Low* (*Oncidioda Cooksoniae* × *Oncidium macranthum*) was the centre of attraction in Messrs. S. LOW AND CO.'s group. This is, in effect, a red-flowered *O. macranthum*, and a very attractive plant. The specimen shown carrying a lovely spike of about thirty-three flowers and buds. *Cattleya Tityus*, *Potinara Mrs. Gratrix* and *Lycaste Balliae* were also shown by this firm.

Messrs. BLACK AND FLORY exhibited a few Orchids, as also did Messrs. COWAN, the latter including *Cattleya Enid* var. *Majestica*, with *Cirrhopetalum picturatum* in their little group. Mr. HARRY DIXON contributed a group containing *Dendrobiums*, coloured *Odontoglossums*, *Cypripediums* and *Cymbidium*s.

#### Floral Committee.

*Present*: Section A.—Mr. H. B. May (in the chair), Mr. J. F. McLeod, Mrs. Ethel M. Wightman, Lady Beatrix Stanley, Mr. H. J. Jones, Mr. D. Ingamells, Mr. Wm. Howe, Mr. J. M. Bridgeford, Mr. George Churcher, Mr. E. R. Janes, Mr. R. Findlay, Mr. W. H. Page, Mr. A. E. Vasey, Mr. W. B. Gingell, Mr. J. P. West, Mr. D. B. Crane, Mrs. Helen Lindsay Smith, Mr. H. R. Darlington and Mr. James B. Riding.

Section B.—Mr. Charles T. Musgrave (in the chair), Mr. W. J. Bean, Mr. Reginald Cory, Mr. Mark Fenwick, Mr. G. Reuthe, Mr. G. Harrow, Mr. W. B. Cranfield, Mr. E. M. Marsden-Jones, Mr. F. G. Preston, Mr. C. Williams, Mr. E. H. Wilding, Mr. H. C. Baker, Mr. G. Yeld, Mr. R. C. Notcutt, Mr. T. Hay, Mr. Clarence Elliott, Mr. E. A. Bowles, Mr. W. G. Baker, Mr. R. D. Trotter and Sir William Lawrence, Bt.

#### AWARDS OF MERIT.

*Crocus biflorus Alexandri major*.—A handsome *Crocus* which was stated to be a seedling *C. biflorus Alexandri*. The rounded flowers have milk-white interiors set off by brilliant orange stigmas and golden anthers. The three outer segments are richly feathered with bright purple. Shown by H. Mc D. EDELSTEN, Esq., Hillside, Lindfield, Sussex.

*Crocus minimus*.—A pretty little species from Corsica. The interiors are bright purple with orange filaments. The three outer segments are attractively feathered with shining chocolate on a pale cream ground. The slender stems are heavily lined with dull purple. Shown by Mrs. W. R. DYKES, Bobbingcourt, Sutton Green, Woking.

*Galanthus plicatus, Warham* var. — This valuable *Snowdrop* was found growing in a cottage garden in Norfolk by the Rev. C. Digby. It is in every respect a greatly improved form of the *Caucasian Snowdrop*. Shown by LADY BEATRIX STANLEY, Sibbertoft Manor, Market Harborough.

#### GROUPS.

*Cyclamens* in large groups made vivid displays of bright colour, and these valuable greenhouse plants were shown in great excellence. Messrs. SUTTON AND SONS filled a large space at the end of the hall with an extensive collection of their well-known strains in splendidly grown plants. For the most part the plants were disposed in large circular groups of definite shades of colour, surrounded by fresh green moss, with an occasional pot of Fern, and a graceful background of Palms. Of the many lovely circles of *Cyclamens* we especially admired those of Salmon Pink, Salmon Scarlet, Bright Pink and Sutton's Firefly, while there was also a good selection of the crested varieties.

Near the entrance, Messrs. PUTTRIDGE, LTD., again set up a magnificent group of their *Caledonian* strain of greenhouse *Cyclamen*. On this occasion most of the plants were set out in rectangular little groups of distinct colours. These also illustrated an admirably strain and high culture. As though to show how fine the plants were, single specimens were placed at intervals between the oblong groups, and these were of great merit.

The DUCHESS OF WELLINGTON (gr. Mr. H. Beckingham), Ewhurst Place, Basingstoke, contributed a valuable group of *Eranthemum*

*pulehellum*, *Cineraria stellata* of rich blue colour, *Primula malacoides* in an admirable strain of large, rosy-flushed flowers, and *Muscari botryoides*. At one end of this excellent group there was a plant of the greenhouse *Iris fimbriata*.

Adjoining their Carnations, Messrs. STUART LOW AND CO. set out good plants of *Camellias*, *Hippeastrums*, *Toxicophleae spectabilis* and that old-time favourite stove plant, *Thysacanthus rutilans*. Their Carnations included good vases of *Arnos Grove*, *Ruby Glow* and *Daphne*. Messrs. ALLWOOD BROS. included vivid flowers of *Laddie* and *Topsy* in their collection of Carnations, while Messrs. C. ENGELMANN, LTD., had equally good vases of *Circe Improved*, *Carola* and other useful varieties.

An interesting collection of shrubs displayed by Messrs. ROBERT VEITCH AND SON included a collection of named *Camellias* of planting size. These were in full bloom and included *Lady Buller*, a variety with large red and white flowers; *Mrs. Wm. Thompson*, large white; and *Kimberley* rich cardinal. There were also many double-flowered sorts of which *Preston Rose*, *nobilissima* and *althaeiflora* were the most attractive. Several distinct species of *Hamamelis* and *Erica lusitanica* were also well represented.

The collection of forced shrubs well arranged by Messrs. L. R. RUSSELL, LTD., included *Azalea mollis* and *A. indica* varieties, several floriferous species of *Pyrus* and *Prunus* and the fragrant *Boronia megastigma*.

Messrs. R. GILL AND SON showed many large trusses of *Rhododendron Cornubia* of vivid colouring, several useful varieties of *R. arboreum*, a large number of spathes of *Richardia (Arum) africana*, and their choice strain of *St. Brigid Anemones*.

A good variety of hybrid *Rhododendrons* was also displayed by Mr. G. REUTHE, who associated them with *Camellias*, *Heaths* and sprays of *Conifers*. In front he had a collection of alpenes, particularly of *Saxifrages* and *Crocuses*.

In a well-made rock garden, Messrs. WM. CUTBUSH AND SON planted goodly breadths of various *Crocuses*, *Primulas*, dwarf *Ericas*, Japanese *Azaleas* and *Brooms*, with a background of foliage shrubs lightened with an occasional *Pyrus* and *Wistaria*.

An attractive collection of early spring flowers was set up by Messrs. BARR AND SONS. They included excellent *Crocuses*, particularly *C. purpureus grandiflorus*, of large size and beautiful colouring, *Helleborus colchicus atrocinus*, *H. Frau Sophie Froebel* and the white *Christmas Rose*. At the back were disposed pots of good *Narcissi*, *Dicentra spectabilis* and other border flowers, with floriferous bushes of *Forsythia spectabilis*.

The CENTRAL GARDEN SUPPLIES CO. showed *Ericas*, hardy *Cyclamens*, *Tulips*, *Primulas* and other spring flowers with dwarf *Conifers*. *Crocuses* of many sorts were attractively shown by Messrs. WATERER, SONS AND CRISP, with *Tulips*, *Primroses*, *Saxifrages*, *Iris reticulata* and a good background of shrubs. *Saxifrages* were freely shown by Messrs. M. PRICHARD AND SON, and they also grouped *Crocuses* and the dainty little *Sisyrinchium grandiflorum*. Blue *Primroses* were again well arranged by Mr. F. G. WOOD, who associated them with *Iris unguicularis*, *Snowdrops* and *Crocuses*.

With good plants of *Saxifraga oppositifolia* splendens, *S. Irvingii* and *S. Burseriana* Messrs. TUCKERS, LTD., showed the attractive growing *Thymus erectus*. A lovely collection of spring flowers was arranged by Messrs. J. CHEAL AND SONS. *Crocuses* and *Saxifrages* were plentifully grouped, while *Primula denticulata*, *Iris reticulata* and Blue *Primroses* were also of merit.

Massed blooms of many spring flowers arranged by Mr. G. W. MILLER made a bright display. He had large numbers of *Polyanthuses* and *Primroses*, with *Daffodils*, *Tulips* and *Crocuses*. The HORTICULTURAL COLLEGE, Aldersey Hall, Cheshire, had a large quantity of well-grown plants of *Iris reticulata*.

A highly creditable exhibit of alpenes in pots and pans was made by C. J. KIRCH, Esq. (gr. Mr. J. Wall), Edenhill, Beckenham. These were well-grown plants, and some of them of exceptional size. His principal sorts were *Saxifraga Grisebachii*, *S. Jenkinsii*, *S.*

Bursleriana Gloria, S. B. major, S. kestoniensis, S. apiculata, Primula Winterti, Bulbocodium vernum and various pretty Crocuses. Primula Winterti was very well shown by Messrs. BAKERS, LTD., who also had good examples of Rhododendron praecox, Dicentra spectabilis and other border plants associated with dwarf alpines.

Saxifrages of various sorts were shown by Mr. CLARENCE ELLIOTT and in goodly quantities of each sort. He also set out pans of Franchis, Primulas and Crocuses. Pots of well-grown Galanthus Atkinsii and G. byzantinus were shown by CHARLES T. MUSGRAVE, Esq., Hascombe Place, Godalming, Surrey. The MISSES ALLEN-BROWN and Mr. J. J. KETTLE staged many vases of fragrant Violets and Mr. J. KLINKERT set out a collection of Topiary specimens.

There were the customary exhibits of paintings of flowers and gardens scenes, and Mrs. BROOKE showed herbarium specimens of Swiss flowers collected in the Upper Rhine Valley. These were dried in hot sand in 1889, and in a few instances still retained some of their original colouring. Miss WINIFRED M. A. BROOKE staged valuable drawings and colour representations of various useful and injurious insects.

#### Narcissus and Tulip Committee.

Present: Mr. E. A. Bowles (in the chair), Mr. G. W. Leak, Mr. Wm. Poupart, Mr. C. W. Needham, Mr. John W. Jones, Mr. G. W. Churcher, Mr. F. Barchard, Mr. F. A. Secrett, Mr. Charles H. Curtis, Mr. Peter R. Barr, Mr. Alfred W. White, Mr. W. B. Cranfield and Mr. Simmonds (Secretary).

#### GROUPS.

On the present occasion the Spring Garden, arranged by Messrs. CARTER AND CO., was in the form of a long border of Tulips, edged with floriferous little Heaths set in fresh, green moss. The Tulips were all of the early Dutch type, and they presented a glorious display of glowing colours. The chief varieties were Sir Thomas Lipton, rich dark cardinal; De Wet, glowing orange; Vermilion Brilliant, Augusta, of fascinating pink flushing; Mon. Trésor, rich yellow; Van der Neer, purple-shaded; and the well-known Keizer's Kroon. This admirably arranged exhibit was completed by a neat background of Yews and other evergreens.

On a large expanse of low tabling, Messrs. R. H. BATH, LTD., exhibited a collection of spring bulbs, grown in ornamental bowls of fibre. These were very successful, and included many Narcissi, particularly Homespun, Crystal Queen, Sir Watkin, Spring Glory and Golden Spur, with several examples of the Tazetta varieties. Chief amongst the Tulips were brilliant bowls of Ibis, Fred Moore, Mon. Trésor and Vermilion Brilliant. They also had good pans of Hyacinths and Crocuses.

A collection of early forced Poeticus Narcissi growing in ornamental earthenware pans, made by Mr. F. A. SECRETT, attracted a deal of attention. The varieties were Red Rim, Wide Wing, Barbellion and Winnie Weeden.

#### Fruit and Vegetable Committee.

Present: Mr. J. Cheal (in the chair), Mr. G. F. Tinley, Mr. W. Poupart, Mr. P. C. M. Veitch, Mr. J. C. Allgrove, Mr. E. Beckett, Mr. A. Bullock, Mr. W. H. Divers, Mr. W. F. Giles, Mr. E. Laxton, Mr. H. Markham, Mr. A. Metcalfe, Mr. E. A. Newby, Mr. T. Pateman, Mr. H. Prince, Mr. P. D. Tuckett, Mr. A. Poupart and Mr. G. Woodward.

An unnamed seedling Apple was shown by Messrs. JAMES CARTER AND CO. The fruits were very much like those of Annie Elizabeth, but in shape, and especially at the base, they resembled a coloured form of Bramley's Seedling. It is a very imposing looking fruit, but some considered it was too near Annie Elizabeth to be distinct, although the shape was certainly different from that variety. The variety was recommended for inclusion in the trial of commercial fruits at Wisley.

Mr. GILES submitted some Tangerine Oranges which he had brought from La Mortola, for the consideration of the Committee. These Oranges were of excellent quality and much superior to those that are packed green and ripened

during transit. The Secretary was requested to send a message of thanks to Mr. Braggins for his kindness in sending the fruits to the Committee.

The following awards have been made to the undermentioned vegetables by the Royal Horticultural Society after trial at Wisley.

#### Celeriac.

##### AWARDS OF MERIT.

*Snowball and Giant Ball*, both sent by Messrs. HEINEMANN, Erfurt.

##### HIGHLY COMMENDED.

*Close Planting*, sent by Messrs. A. DICKSON.

#### Garden Swedes.

##### HIGHLY COMMENDED.

*Early White Selected*, sent by Messrs. BARR AND SONS; *White Smooth*, *Yellow Neckless*, *Early Yellow* and *Perfection Purple Top*, the last four sent by Messrs. DICKSON AND ROBINSON.

##### COMMENDED.

*Laing's Garden*, sent by Messrs. J. KELWAY AND SON; *Garden Selected*, sent by Messrs. DOBBIE AND CO.

#### Artichokes.

##### HIGHLY COMMENDED.

*Fuseau (Helianthus tuberosus)*, sent by The Hon. VICARY GIBBS.

#### READING AND DISTRICT GARDENERS'.

THERE was an excellent attendance at the fortnightly meeting of this Association, on Monday, February 7. Mr. J. R. Lloyd presided.

The subject for the evening was "The Vine," and this was dealt with in a most practical lecture by Mr. A. G. Nichols, Reading, who was for many years gardener at Strathfieldsaye. The various points touched upon by the lecturer were suitable houses, borders and rooting mediums, planting supernumerary vines, temperatures, ventilation, moisture, pruning and training, stopping, setting the fruit, thinning, watering, cracking and splitting of the berries, diseases, insect pests, propagation by eyes, cuttings and layers, and varieties. An exceedingly interesting discussion followed the lecturer's remarks.

In the competition for three dishes of vegetables some excellent produce was staged. In class I (open) the first prize was awarded to Mr. J. WYNN, Hammonds Gardens, Checkendon, whose Parsnips were extra fine; the second to Mr. A. H. DOW, Chalcot Park Gardens; and the third to Mr. C. S. CLACY, Sidmouth Grange Gardens. In Class II (amateurs), Mr. F. PRIEST, Westbourne Terrace, Reading, was placed first, and Mr. T. F. PACKER, Collis Road, Reading, second.

#### ROYAL SCOTTISH ARBORICULTURAL.

THE annual general meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on February 4. Sir Hugh Shaw Stewart, Bart., C.B., of Ardgowan, the President, occupied the chair, and there was a good attendance, including Lord Lovat, Mr. Robinson and other members and officials of the Forestry Commission.

The Chairman welcomed Lord Lovat, who was about to take up a new post in the Government, and invited him to address the meeting. After referring to the planting programme, Lord Lovat stated that the Commission had carried out a census of the woodlands of England and Scotland, which had taken five years, and that the figures would be available very shortly. He was sure that when they saw these figures they would be surprised at the areas of timber that were cut down and had not been replanted, at the proportion of what he might call uneconomical woods out of the three million acres which existed, and at the small area of mature Conifers which existed in Great Britain. He also referred to the investigations which had

been commenced regarding peat areas, and stated that they hoped to treat successfully for planting a good many types of this material which had not been successfully dealt with in the past.

In his address, which was entitled "British Forestry: Some deductions from the Past and some Hopes for the Future," Sir Hugh Shaw Stewart said that no attempt at forestry, as we knew it, was made until the first quarter of the eighteenth century. In 1738, the second Duke of Atholl commenced to make extensive plantations of the European Larch. Little more than one hundred years ago extravagant expectations were held out regarding forestry, and in the failure of these sanguine hopes they might find some explanation of the neglect of forestry by their immediate predecessors. But there were some brilliant exceptions, including Mr. Munro Ferguson (now Lord Novar). In the latter part of the nineteenth century he and other proprietors who had studied Continental forestry methods devoted much of their energy and skill to the practice of these methods at home on a considerable scale, and had it been possible in those days to introduce the new trees in such quantities as to plant them in forest formation, they would have learned lessons that they were now only beginning to apprehend. The fashion of planting trees in isolation had led many planters to wrong conclusions. One was the fallacy that in order to prevent undue spread of branch formation they should rush to the other extreme and crowd them in the densest formation, a wrong conclusion, as he believed it to be, which received a great impetus from Mr. John Simpson's book, *The New Forestry*, published in 1900.

Sir Hugh said that the work of the Forestry Commission had already made a great mark in the forest history of the twentieth century, and that the explanation of the success was due to the composition of the Commission, and especially to the personality of its first Chairman, Lord Lovat. The apprehensions of some landowners who hesitated to replant areas felled during the war and after might be removed when it was realised that an area of land properly planted contained a far higher prospective value than such land left derelict and waste. In referring to death duties, he said these only fell heavily on an estate in a case where the heir chose to make a heavy felling in order to pay the death duty, or for some other special purpose.

In the course of the discussion, Mr. A. D. Richardson said that he was absolutely opposed to wide planting, and he thought the Society had seen the last of this when in 1895 they went to Prussia, where they saw some of the best-managed Coniferous forests in Europe, if not in the world. They had first to lay the foundation of the tree, and for this they must have proper density and branch suppression at a very early age. If they planted Douglas Fir at eight feet apart the side branches would not die for twenty years, and they would hold on for another twenty years, with the result that they would get a mass of rough timber which would not be worth more than twopence per cubic foot, whereas if they were closely grown it might be worth one shilling per foot.

The President, in reply, stated that for commercial timber they had found it better to have the planting width eight feet. Professor Borthwick and Mr. Robinson, the technical member of the Commission, supported the President's view, and the latter stated that the tendency was to plant wider, and the only reason why he did not plant wider was lack of courage.

Sir Hugh Shaw Stewart was re-elected President, and Mr. J. H. Milne Home was elected to the vacant Vice-Presidency. Mr. R. Angus Galloway, M.C., B.Sc. (For.), was elected Joint-Secretary and Treasurer, along with Mr. R. Galloway, who was re-elected. It was agreed to have an excursion to Belgium at the end of June.

At the close of the proceedings, Professor Borthwick was presented with a writing table and chair made from Scots-grown Laburnum in recognition of his services as honorary editor of the *Transactions* of the Society for the past fifteen years. The presentation was made by the President on behalf of the subscribers.

## ROYAL CALEDONIAN HORTICULTURAL.

The ordinary monthly meeting of this Society was held at 6, St. Andrew Square, Edinburgh, on February 1, Mr. W. J. Thompson, President, in the chair.

Mr. Wm. Cuthbertson, V.M.H., gave a lecture entitled "Horticulture at the Cross Roads." The point at which we had arrived, he said, was not by a direct road, and the great cross-road was the war. The glory of horticulture had, to a large extent, departed, and many of the fine private gardens had become market gardens, only a small proportion of the larger establishments being kept up on the former scale. But as good work was being done to-day in horticulture as ever before, although it was not, perhaps, so apparent. He referred to the transformation which had been brought about by varying taste, such as in the Dahlia, Pansy and Viola, which were largely grown in the public parks in the United States; Carnations, of which the perpetual-flowering kinds were largely grown, while the Malmaisons had gone largely out of cultivation; Sweet Peas, in which further advances seemed almost infinitesimal; Roses, in which there was still plenty of room for improvement, and in which the interest was never greater than at the present day; and Daffodils. Mr. Cuthbertson also referred to several other topics, such as that commercial gardening was now resolving itself into two distinct lines, the edible and the non-edible, that there was a great spread of gardening among amateurs, and that articles on the subject were now appearing in the daily press.

The exhibits were: Mahonia (syn. Berberis) Bealei, from Corsewell Gardens, and Snowdrops and Ericas from Miss NICHOLSON, Wigtown.

## BIRMINGHAM AND MIDLAND GARDENERS'.

At the annual meeting of this Society the annual report and balance sheet were adopted. Dr. J. B. Elliott, of the University, Edmund Street, again kindly consented to act as President; Mr. J. Smith, Birmingham Parks Superintendent, was unanimously elected Chairman.

At the fortnightly meeting, held on January 25, Mr. J. Smith in the chair, Mr. H. Overton gave an interesting lecture on "A visit to the North Cape," illustrated with lantern slides. Landing at Bergen, the lecturer travelled up the coast via Trondgem, Tromsø, Lingen and Hammerfest; the slides showed alpine plants growing in their natural habitat, in addition to scenes and places of interest.

—At the general meeting of this Association held on February 7, Mr. J. Smith in the chair, Mr. C. W. Beeton, of Kings Norton, gave a lecture on the "Cultivation of Roses," dealing with exhibition and decorative varieties suitable for the Birmingham district. He recommended an open situation, deep digging, and the best oam obtainable, with manure well incorporated a foot under the surface. The methods of planting, staking and tying of standard and climbers were fully explained.

## UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THE monthly meeting of this Society was held in the Royal Horticultural Society's Hall, on Monday, February 14, Mr. Chas. H. Curtis presiding.

Fifteen new members were elected. Two members withdrew interest from their deposit accounts sums amounting to £6 16s. 4d., while four members, being over the age of seventy years, withdrew amounts totalling £78 9s. 11d. from their deposit accounts, £87 4s. 7d. was passed for payment to the nominees of two deceased members. Sick pay for the month on the Ordinary side amounted to £127 6s. 8d., and in the State Section to £140 6s. 10d., while maternity benefits came to £10 0s. 0d. The sum of £33 10s. 0d. was granted to eight members towards dental and optical treatment, and numerous cases for relief were considered.

A draft of the Annual Report was submitted and passed for presentation to the Annual Meeting, which is to be held on March 14.

## KINGSTON AND SURBITON CHRYSANTHEMUM.

THE annual meeting of this Society was held on the 17th ult. The President, G. C. Hodgson, Esq., occupied the chair. The report of the Committee for 1926 showed steady progress, but the balance of £9 3s. 6d. is less than last year owing to a falling off in subscriptions. The Society possesses five valuable Silver Cups. The date of the show for this year was altered to Wednesday, November 9, instead of November 2, as previously announced.

Mr. W. H. Divers, V.M.H., was reappointed Secretary, and the Committee was re-elected.

## CARDIFF AND DISTRICT GARDENERS'.

A WELL-ATTENDED meeting of the above Association was held at the Queen's Hotel, Cardiff, on the 18th inst; Mr. J. Hall occupied the chair. Mr. C. Wall, Melrose Nurseries, gave a lecture on "The Culture of the Cyclamen." Mr. Wall showed many fine blooms of Cyclamens and a well-flowered plant of his own strain to illustrate his method of culture. The first and second prizes, offered for three plants of Cyclamens were won by Mr. Jones and Mr. Bullock, respectively.

## Obituary.

**Octave Burvenich.**—We are very sorry to learn of the recent death at Ghent, at the age of sixty-seven, of M. Octave Burvenich, the Curator of the Botanic Garden of Ghent, and formerly professor at the State Horticultural College in the same city. Those who have been associated in any official capacity with the Ghent Quinquennial Shows will remember M. Burvenich, and deeply regret that his presence will not again grace these functions.

**Mrs. J. H. Goodacre.**—We learn with regret that Mrs. Goodacre, widow of Mr. J. H. Goodacre, who was for upwards of fifty years gardener at Elvaston Castle, recently passed away at the advanced age of seventy-five years. Mrs. Goodacre was an ardent Church worker, and invariably undertook the floral decorations at Elvaston at Easter and other festivals.

**Henry Jones.**—There passed away at Norwich, on February 19, another of the old-time, well-known East Anglian gardeners. For sixty-two years Mr. Henry Jones had been in the service of the late Jeremiah James Colman, Esq., and his daughters. Although of a somewhat retiring disposition, Mr. Jones was very keen in his profession, as was evidenced by the quality of the produce he grew at Carrow. His ideas of outside planning and laying-out of new borders were very pronounced and effective, and when the opening up of the old ruins of Carrow Abbey was in hand he used his skill to great advantage in adopting and harmonising plants with the ancient surroundings. Though for many years he has not been an exhibitor, his services up to quite recently were sought as a judge at important local shows. When he had completed fifty years' service at Carrow he wrote a brief autobiography of himself, in which he mentioned all the gardeners that have served under him, and gave a list of all the trees in Carrow Abbey grounds. H. P.

**Ludwig Radlkofer.**—We regret to learn that Dr. Ludwig Radlkofer, until recently the Director of the Royal Botanical Museum at Munich, has died there, in his ninety-eighth year. Born there in 1829, he graduated at the local University, and at thirty years of age was appointed to a professorship, which has lasted ever since. His chief contribution to botanical study lay in introducing anatomical methods, and his published works, were many. He was a Fellow of the Linnean Society of London.

## ANSWERS TO CORRESPONDENTS.

**FOLIAGE OF VARIOUS PLANTS DECAYING.**—J. T. W. From the specimens you sent us of Primulas, Pelargoniums and Cinerarias, it would seem as though you have grown them in an excessive amount of atmospheric moisture, for they all appear to have simply damped off. Probably you were unable to obtain sufficient fuel during the coal strike to keep the house warm enough for the air to circulate freely. Take off all decayed leaves and stand the plants well apart. Open the ventilators of the house on favourable occasions to keep the air drier and in circulation. Damp in winter is a greater enemy to all these plants than cold.

**FUNGUS ON AN AZALEA.**—E. T. The foliage you sent is affected with the fungus *Exobasidium rhododendri*. Gather and burn all foliage showing the gall-like growths. It has been found that if the galls are removed and burnt before they have developed colour the plants will be free from attack in the following year.

**HIPPEASTRUMS AND GRIFFINIA HYACINTHINA.**—Sir John T. (1) *Hippeastrum procerrum* (syn. H. Rayneri) is an evergreen species, and should not be dried off completely at any time, although it should be kept on the dry side during the winter. It must be regarded as a difficult plant under cultivation, as it seldom flowers except from newly-imported bulbs and, as a rule, it has not proved long-lived in cultivation. It probably does best when planted out on an elevated and well-drained bed, in which the roots can ramify amongst a mass of rubble mixed with a little soil, as this rooting-medium somewhat approaches its natural conditions, where it grows on the face of high cliffs. A coloured supplement of this plant was given in *Gard. Chron.*, July 27, 1912, accompanied by a note by the late Mr. William Watson, on p. 73. (2) *Hippeastrum equestre*, succeeds under the same treatment accorded the garden forms of *Hippeastrums*, and although it may be grown without a rest, there is more chance of it flowering if it is gradually dried off during August and September. When dried off it may be kept in a temperature of 40° to 45°. The plant may be started into growth again early in the New Year in a house having a temperature of 50° to 60°, affording water very carefully at the roots until growth is active. (3) *Griffinia hyacinthina* is another beautiful plant, which, like many other bulbous subjects, has not proved over happy in cultivation, as it has proved to be short-lived in gardens, and after attaining flowering size, gradually deteriorates. After completing its growth the plant should be dried off for a time and started into growth again during February or March.

**PEACH TREES UNHEALTHY.**—H. T. From the brief description you give of your Peach tree dropping its buds, and your confidence that the roots have not been dry, there is only one other cause to account for the failure. Peaches, like all other fruits grown under glass, need a season of rest during the winter, and the necessity to use sufficient fire-heat to keep soft-wooded plants through the winter is undoubtedly the cause of the trouble. The wood sent is not well-ripened, and unless hard-wooded plants only are wintered in the house, you will have a repetition of the trouble. Pay careful attention to watering the roots, syringing the trees and ventilating the house.

**VIOLET PLANTS UNSATISFACTORY.**—F. J. B. It is impossible for us to say what the conditions of the plants were when you received them from the nurseryman, and it is not fair to expect us to give an opinion on the dried-up specimens you sent us.

**Communications Received.**—J. H.—D. M. R.—G. B.—J. B.—W. A.—J. J.—A. E. F.—P. H. M.—Berks.—C. F. S.—J. C. and C.—E. J. B.—J. C.—J. B. W.—C. E.—M.—E. B.—H. K.—Old Reader.

REMARKS.—There is a general increase of supplies from home-growers and the Channel Islands. Daffodils and Narcissus are arriving in fairly large quantities from the

latter source. Best quality blooms of Emperor, Golden Spur, King Alfred, Victoria and Sir Watkin from home-growers still maintain good prices. Princess of Wales Violets are being received in excellent condition, the prices varying from 1/6 to 6/- per dozen bunches. Anemone fulgens is the newest subject in this department. Of Tulips, coloured sorts have been most plentiful. The varieties La Reine and White Hawk were more limited in quantity during last week-end. Darwin Tulips are cheaper owing to increasing supplies; these are now very fine in quality, and there is also a good selection of varieties. In the French department similar conditions prevail as those given last week. More double white Stock is greatly welcomed, also some long-stemmed Freesia, yellow Marguerites and Wallflowers. All Anemones are lower in value; the quality generally is good.

REMARKS.—Following a period of slackness, due mainly to adverse weather, there is a distinct improvement reported from most departments. The shipments of fruits from South Africa have assumed important proportions this week. Peaches, Pears, Plums and Grapes are generally in good condition and meeting a favourable demand. Imported Apples are a quiet trade and ample stocks are on hand. Oranges of first quality are selling freely and supplies are not particularly heavy. There is still an enquiry for home-grown Bramley's Seedling, good samples of which are selling for comparatively high prices. Hothouse Grapes are costly, considering the competition of choice fruits from the Cape. Forced vegetables, such as Beans, new Potatoes and Asparagus, are making satisfactory prices. Mushrooms are arriving in better supply, but the price for this vegetable remains fairly stable. Salads, mainly from France, are in demand and sell well. Trade in green vegetables is not good, and there is room for much improvement. Cucumbers are arriving in bigger quantities, which is reflected in the low selling prices. New Potatoes from the Canary Islands are not selling very freely. The conditions of the trade in old Potatoes remain unchanged.

## GLASGOW.

The tone of the cut flower market remained steady until Friday, when prices drooped as the result of supplies being more plentiful than they have been for several weeks. Tulips were about 2d. per bunch cheaper, Le Notre being worth 1/2 to 1/6 (6d.). Double Yellow, 1/4 to 1/7; Bartigon and William Pitt, 1/- to 1/4; Lucretia

and Ibis, 1/- to 1/3; Flamingo and William Copland, 10d. to 1/3; Couronne d'Or, 10d. to 1/2; Tea Rose, 9d. to 1/2; La Reine and Prince of Austria, 8d. to 1/-; Muriello, 6d. to 8d., and specials, 8d. to 1/-; Daffodils offered a wider choice at the following values: princeps, 10d. to 1/- per bunch; Golden Spur and Sir Watkin, 1/- to 1 1/2; Emperor, 1/- to 1 1/4; King Alfred, 2/- to 2 1/2; ornatus, 8d. to 10d.; and French Narcissus, 3/6 to 5/- per dozen. Prices of Carnations ranged from 3/6 to 5/- per dozen; Snowdrops, 1/- to 1 1/6; English Violets, 1/-; Mimosa, 6/- to 8/- per case; Lily-of-the-Valley, 1/6 to 1/9 per bunch; Lilac, 1/6 to 2/-; Lillium longiflorum. (Harrisii) 12/- to 14/-; Smilax, 9d. to 1/6; and Asparagus, 1/- to 1 1/6. Cyclamens in pots sold at 1/6 and 2/-, according to size.

Business in the fruit market showed improvement and the prices of Apples continued to move upward. Winesaps, extra fancy, made 12/6 to 16/- per case; fancy 11/6 to 15/-; Newtown, 11/6 to 15/6; Rose, 16/-; Ben. Davis and Baldwin, 26/- to 28/- per barrel; York Imperial, 28/- to 32/-; and Greening, 30/- to 34/-; Jaffa Oranges, all counts, were 1/- cheaper, while Valencia brands were quoted as follows: 300's, 19/- to 21/-; 360's, 17/- to 19/-; 71's, 30/- to 33/-; 420's, 26/- to 31/-; extra large, 35/- to 38/-; Palermo Bitter Oranges averaged 15/- per case. The value of Grape Fruit ranged from 30/- to 35/-; and Palermo Lemons, 14/- per box and 18/- per case. Cape Plums (Satsuma) sold for 6/- to 7/6 per tray. Peaches, 8/-, and Pears Williams's bon Chretien, 5/- to 6/-; Gros Colmar Grapes realised 4/6 per lb.

In the vegetable section prices of Cucumbers varied from 1/6 to 2/- each; Tomatoes, 18/- to 26/- per bundle; Rhubarb, 26/- to 30/- per cwt.; Sea Kale, 2/9 to 3/-; Cauliflowers, 9/- to 10/- per two dozen; Algerian Potatoes, 4d. per lb.; Jersey Potatoes, 9d. to 1/-; and Lettuces, 5/- to 6/- per crate.

## TRADE NOTES.

THE name of Stephens is familiar to everyone and stands for all that is best in the matter of ink. Hitherto Stephens' ink has been best known in connection with writing inks, typewriting and printing inks, but the firm has now ventured into the garden, and provided an out-door ink especially suitable for garden labels. By means of an ordinary fine-nibbed pen the name of a plant may be written in legible characters on labels of wood, metal or celluloid. If allowed to dry, the ink will not "run," and the makers state that it is waterproof and unfading—qualities the gardener will greatly appreciate.

THE Advisory Committee provided for in Section 23 of the Fertilisers and Feeding Stuffs Act, 1926, has now been appointed jointly by the Minister of Agriculture and Fisheries and the Board of Agriculture for Scotland. Its constitution is as follows:—Lord Clinton (Chairman), Mr. E. Richards Bolton, F.I.C., Mr. E. G. Haygarth Brown, I.S.O., Dr. Charles Crowther, M.A., Ph.D., Mr. J. Garton, Mr. C. W. Higgs, Mr. Arthur Holgate, Mr. Thomas Kyle, Mr. Alexander Main, M.A., B.Sc., Mr. John C. Menzies, Mr. Brian S. Miller, Lt.-Col. R. L. Norrington, C.M.G., Mr. J. W. Pearson, Mr. R. R. Robbins, C.B.E., Dr. G. Scott Robertson, D.Sc., Sir E. J. Russell, O.B.E., D.Sc., Mr. John Speir, Mr. George Stubbs, C.B.E., Dr. J. F. Tocher, D.Sc., Dr. J. A. Voelcker, M.A., D.Sc., and Professor T. B. Wood, C.B.E., M.A. Mr. H. J. Johns, of the Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W.1, is the Secretary. The immediate duties of the Committee will be to prepare recommendations as to the regulations which will require to be made before the Act can come into operation and to consider a number of suggestions with regard to the contents of the Schedules to the Act.

## GARDENING APPOINTMENT.

Mr. John McWhan, as gardener to the Hon. Mrs. F. COLBORNE, Nonsuch Park, Cheam, Surrey. (Thanks for 1/6 for R.G.O.F. Box.—Eds.)

## CATALOGUES RECEIVED.

BARR AND SONS, 11, 12 and 13, King Street, W.C.2.—Hardy perennials, rock plants, alpines, etc.  
THE WASHINGTON CHEMICAL CO., LTD., Washington Station, Durham.—"Newstr" powder for the land.  
DICKSON AND ROBINSON, Cathedral Street, Manchester.—Farm seeds.  
K. LUXFORD AND CO., Sheering Nurseries, Harlow, Essex.—Chrysanthemums.  
BARDSEYS, 106, Bergholt Road, Colchester.—Sundries.  
A. H. AND A. MILLS, 4, Park View Road, Welling, Kent.—Roses.

## ROYAL CALEDONIAN HORTICULTURAL.

THE ordinary monthly meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on February 1, Mr. W. J. Thompson, President, in the chair.

Mr. Wm. Cuthbertson, V.M.H., gave a lecture entitled "Horticulture at the Cross Roads." The point at which we had arrived, he said, was not by a direct road, and the great cross-road was the war. The glory of horticulture had, to a large extent, departed, and many of the fine private gardens had become market gardens, only a small proportion of the larger establishments being kept up on the former scale. But as good work was being done to-day in horticulture as ever before, although it was not, perhaps, so apparent. He referred to the transformation which had been brought about by varying taste, such as in the Dahlia, Pansy and Viola, which were largely grown in the public parks in the United States; Carnations, of which the perpetual-flowering kinds were largely grown, while the Malmaisons had gone largely out of cultivation; Sweet Peas, in which further advances seemed almost infinitesimal; Roses, in which there was still plenty of room for improvement, and in which the interest was never greater than at the present day; and Daffodils. Mr. Cuthbertson also referred to several other topics, such as that commercial gardening was now resolving itself into two distinct lines, the edible and the non-edible, that there was a great spread of gardening among amateurs, and that articles on the subject were now appearing in the daily press.

The exhibits were: Mahonia (syn. Berberis) Bealei, from Corsewell Gardens, and Snowdrops and Ericas from Miss Nicholson, Wigtown.

## BIRMINGHAM AND MIDLAND GARDENERS'.

At the annual meeting of this Society the annual report and balance sheet were adopted. Dr. J. B. Elliott, of the University, Edmund Street, again kindly consented to act as President; Mr. J. Smith, Birmingham Parks Superintendent, was unanimously elected Chairman.

At the fortnightly meeting, held on January 25, Mr. J. Smith in the chair, Mr. H. Overton gave an interesting lecture on "A visit to the North Cape," illustrated with lantern slides. Landing at Bergen, the lecturer travelled up the coast via Trondgem, Tromsø, Lingen and Hammerfest; the slides showed alpine growing in their natural habitat, in addition to scenes and places of interest.

—At the general meeting of this Association held on February 7, Mr. J. Smith in the chair, Mr. C. W. Beeton, of Kings Norton, gave a lecture on the "Cultivation of Roses," dealing with exhibition and decorative varieties suitable for the Birmingham district. He recommended an open situation, deep digging, and the best oam obtainable, with manure well incorporated a foot under the surface. The methods of planting, staking and tying of standard and climbers were fully explained.

## UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THE monthly meeting of this Society was held in the Royal Horticultural Society's Hall, on Monday, February 14, Mr. Chas. H. Curtis presiding.

Fifteen new members were elected. Two members withdrew interest from their deposit accounts sums amounting to £6 16s. 4d., while four members, being over the age of seventy years, withdrew amounts totalling £78 9s. 11d. from their deposit accounts, £87 4s. 7d. was passed for payment to the nominees of two deceased members. Sick pay for the month on the Ordinary side amounted to £127 6s. 8d., and in the State Section to £140 6s. 10d., while maternity benefits came to £10 0s. 0d. The sum of £33 10s. 0d. was granted to eight members towards dental and optical treatment, and numerous cases for relief were considered.

A draft of the Annual Report was submitted and passed for presentation to the Annual Meeting, which is to be held on March 14.

## KINGSTON AND SURBITON CHRYSANTHEMUM.

THE annual meeting of this Society was held on the 17th ult. The President, G. C. Hodgson, Esq., occupied the chair. The report of the Committee for 1926 showed steady progress, but the balance of £9 3s. 6d. is less than last year owing to a falling off in subscriptions. The Society possesses five valuable Silver Cups. The date of the show for this year was altered to Wednesday, November 9, instead of November 2, as previously announced.

Mr. W. H. Divers, V.M.H., was reappointed Secretary, and the Committee was re-elected.

## CARDIFF AND DISTRICT GARDENERS'.

A WELL-ATTENDED meeting of the above Association was held at the Queen's Hotel, Cardiff, on the 18th inst; Mr. J. Hall occupied the chair. Mr. C. Wall, Melrose Nurseries, gave a lecture on "The Culture of the Cyclamen." Mr. Wall showed many fine blooms of Cyclamens and a well-flowered plant of his own strain to illustrate his method of culture. The first and second prizes, offered for three plants of Cyclamens were won by Mr. Jones and Mr. Bullock, respectively.

## Obituary.

**Octave Burvenich.**—We are very sorry to learn of the recent death at Ghent, at the age of sixty-seven, of M. Octave Burvenich, the Curator of the Botanic Garden of Ghent, and formerly professor at the State Horticultural College in the same city. Those who have been associated in any official capacity with the Ghent Quinquennial Shows will remember M. Burvenich, and deeply regret that his presence will not again grace these functions.

**Mrs. J. H. Goodacre.**—We learn with regret that Mrs. Goodacre, widow of Mr. J. H. Goodacre, who was for upwards of fifty years gardener at Elvaston Castle, recently passed away at the advanced age of seventy-five years. Mrs. Goodacre was an ardent Church worker, and invariably undertook the floral decorations at Elvaston at Easter and other festivals.

**Henry Jones.**—There passed away at Norwich, on February 19, another of the old-time, well-known East Anglian gardeners. For sixty-two years Mr. Henry Jones had been in the service of the late Jeremiah James Colman, Esq., and his daughters. Although of a somewhat retiring disposition, Mr. Jones was very keen in his profession, as was evidenced by the quality of the produce he grew at Carrow. His ideas of outside planning and laying-out of new borders were very pronounced and effective, and when the opening up of the old ruins of Carrow Abbey was in hand he used his skill to great advantage in adopting and harmonising plants with the ancient surroundings. Though for many years he has not been an exhibitor, his services up to quite recently were sought as a judge at important local shows. When he had completed fifty years' service at Carrow he wrote a brief autobiography of himself, in which he mentioned all the gardeners that have served under him, and gave a list of all the trees in Carrow Abbey grounds. H. P.

**Ludwig Radlkofer.**—We regret to learn that Dr. Ludwig Radlkofer, until recently the Director of the Royal Botanical Museum at Munich, has died there, in his ninety-eighth year. Born there in 1829, he graduated at the local University, and at thirty years of age was appointed to a professorship, which has lasted ever since. His chief contribution to botanical study lay in introducing anatomical methods, and his published works, were many. He was a Fellow of the Linnean Society of London.

## ANSWERS TO CORRESPONDENTS.

**FOLIAGE OF VARIOUS PLANTS DECAYING.**—J. T. W. From the specimens you sent us of Primulas, Pelargoniums and Cinerarias, it would seem as though you have grown them in an excessive amount of atmospheric moisture, for they all appear to have simply damped off. Probably you were unable to obtain sufficient fuel during the coal strike to keep the house warm enough for the air to circulate freely. Take off all decayed leaves and stand the plants well apart. Open the ventilators of the house on favourable occasions to keep the air drier and in circulation. Damp in winter is a greater enemy to all these plants than cold.

**FUNGUS ON AN AZALEA.**—E. T. The foliage you sent is affected with the fungus *Exobasidium rhododendri*. Gather and burn all foliage showing the gall-like growths. It has been found that if the galls are removed and burnt before they have developed colour the plants will be free from attack in the following year.

**HIPPEASTRUMS AND GRIFFINIA HYACINTHINA.**—Sir John T. (1) *Hippeastrum procerrum* (syn. H. Rayneri) is an evergreen species, and should not be dried off completely at any time, although it should be kept on the dry side during the winter. It must be regarded as a difficult plant under cultivation, as it seldom flowers except from newly-imported bulbs and, as a rule, it has not proved long-lived in cultivation. It probably does best when planted out on an elevated and well-drained bed, in which the roots can ramify amongst a mass of rubble mixed with a little soil, as this rooting-medium somewhat approaches its natural conditions, where it grows on the face of high cliffs. A coloured supplement of this plant was given in *Gard. Chron.*, July 27, 1912, accompanied by a note by the late Mr. William Watson, on p. 73. (2) *Hippeastrum equestre*, succeeds under the same treatment accorded the garden forms of *Hippeastrums*, and although it may be grown without a rest, there is more chance of it flowering if it is gradually dried off during August and September. When dried off it may be kept in a temperature of 40° to 45°. The plant may be started into growth again early in the New Year in a house having a temperature of 50° to 60°, affording water very carefully at the roots until growth is active. (3) *Griffinia hyacinthina* is another beautiful plant, which, like many other bulbous subjects, has not proved over happy in cultivation, as it has proved to be short-lived in gardens, and after attaining flowering size, gradually deteriorates. After completing its growth the plant should be dried off for a time and started into growth again during February or March.

**PEACH TREES UNHEALTHY.**—H. T. From the brief description you give of your Peach tree dropping its buds, and your confidence that the roots have not been dry, there is only one other cause to account for the failure. Peaches, like all other fruits grown under glass, need a season of rest during the winter, and the necessity to use sufficient fire-heat to keep soft-wooded plants through the winter is undoubtedly the cause of the trouble. The wood sent is not well-ripened, and unless hard-wooded plants only are wintered in the house, you will have a repetition of the trouble. Pay careful attention to watering the roots, syringing the trees and ventilating the house.

**VIOLET PLANTS UNSATISFACTORY.**—F. J. B. It is impossible for us to say what the conditions of the plants were when you received them from the nurseryman, and it is not fair to expect us to give an opinion on the dried-up specimens you sent us.

**Communications Received.**—J. H.—D. M. R.—G. B.—J. B.—W. A.—J. J.—A. E.—P. H. M.—Berks.—C. F. S.—J. C. and C.—E. J. B.—J. C.—J. B. W.—C. E.—M.—E. B.—H. K.—Old Reader.

REMARKS.—There is a general increase of supplies from home-growers and the Channel Islands. Daffodils and Narcissus are arriving in fairly large quantities from the

latter source. Best quality blooms of Emperor, Golden Spur, King Alfred, Victoria and Sir Watkin from home-growers still maintain good prices. Princess of Wales Violets are being received in excellent condition, the prices varying from 1 6 to 6—per dozen bunches. Anemone fulgens is the newest subject in this department. Of Tulips, coloured sorts have been most plentiful. The varieties La Reine and White Hawk were more limited in quantity during last week-end. Darwin Tulips are cheaper owing to increasing supplies; these are now very fine in quality, and there is also a good selection of varieties. In the French department similar conditions prevail as those given last week. More double white Stock is greatly welcomed, also some long-stemmed Freesia, yellow Marguerites and Wallflowers. All Anemones are lower in value; the quality generally is good.

REMARKS.—Following a period of slackness, due mainly to adverse weather, there is a distinct improvement reported from most departments. The shipments of fruits from South Africa have assumed important proportions this week. Peaches, Pears, Plums and Grapes are generally in good condition and meeting a favourable demand. Imported Apples are a quiet trade and ample stocks are on hand. Oranges of first quality are selling freely and supplies are not particularly heavy. There is still an enquiry for home-grown Bramley's Seedling, good samples of which are selling for comparatively high prices. Hothouse Grapes are costly, considering the competition of choice fruits from the Cape. Forced vegetables, such as Beans, new Potatoes and Asparagus, are making satisfactory prices. Mushrooms are arriving in better supply, but the price for this vegetable remains fairly stable. Salads, mainly from France, are in demand and sell well. Trade in green vegetables is not good, and there is room for much improvement. Cucumbers are arriving in bigger quantities, which is reflected in the low selling prices. New Potatoes from the Canary Islands are not selling very freely. The conditions of the trade in old Potatoes remain unchanged.

## GLASGOW.

The tone of the cut flower market remained steady until Friday, when prices dropped as the result of supplies being more plentiful than they have been for several weeks. Tulips were about 2d. per bunch cheaper, Le Notre being worth 1 2 to 1 6 (8s); Double Yellow, 1 4 to 1 7; Bartigon and William Pitt, 1 1 to 1 4; Lucretia

and Ibis, 1 1 to 1 3; Flamingo and William Copland, 10d. to 1 3; Couronne d'Or, 10d. to 1 2; Tea Rose, 9d. to 1 2; La Reine and Prince of Austria, 8d. to 1 2; Muriello, 6d. to 8d., and specials, 8d. to 1 1. Daffodils offered a wider choice at the following values: princeps, 10d. to 1 1 per bunch; Golden Spur and Sir Watkin, 1 1 to 1 2; Emperor, 1 1 to 1 4; King Alfred, 2 1 to 2 6; ornatus, 8d. to 10d.; and French Narcissus, 4 6 to 5 1 per dozen. Prices of Carnations ranged from 3 6 to 5 1 per dozen; Snowdrops, 1 1 to 1 6; English Violets, 1 1; Mimosa, 6 1 to 8 1 per cane; Lily-of-the-Valley, 1 6 to 1 9 per bunch; Lilac, 1 6 to 2 1; Lilium longiflorum. (Harrisii) 12 1 to 14 1; Smilax, 9d. to 1 6; and Asparagus, 1 1 to 1 6. Cyclamens in pots sold at 1 6 and 2 1, according to size.

Business in the fruit market showed improvement and the prices of Apples continued to move upward. Winesaps, extra fancy, made 12 6 to 16 1 per case; fancy 11 6 to 15 1; Newtown, 11 6 to 15 6; Rose, 16 1; Ben, Davis and Baldwin, 26 1 to 28 1 per barrel; York Imperial, 28 1 to 32 1; and Greening, 30 1 to 34 1. Jaffa Oranges, all counts, were 1 1 cheaper, while Valencia brands were quoted as follows: 300's, 19 1 to 21 1; 360's, 17 1 to 19 1; 714's, 30 1 to 33 1; 420's, 26 1 to 31 1; extra large, 35 1 to 38 1. Palermo Bitter Oranges averaged 15 1 per case. The value of Grape Fruit ranged from 30 1 to 35 1; and Palermo Lemons, 14 1 per box and 18 1 per case. Cape Plums (Satsuma) sold for 6 1 to 7 6 per tray. Peaches, 8 1, and Pears Williams's bon Chretien, 5 1 to 6 1. Gros Colmar Grapes realised 4 6 per lb.

In the vegetable section prices of Cucumbers varied from 1 6 to 2 1 each; Tomatoes, 18 1 to 26 1 per bundle; Rhubarb, 26 1 to 30 1 per cwt.; Sea Kale, 2 9 to 3 1; Cauliflowers, 9 1 to 10 1 per two dozen; Algerian Potatoes, 4d. per lb; Jersey Potatoes, 9d. to 1 1; and Lettuces, 5 1 to 6 1 per crate.

## TRADE NOTES.

THE name of Stephens is familiar to everyone and stands for all that is best in the matter of ink. Hitherto Stephens' ink has been best known in connection with writing inks, typewriting and printing inks, but the firm has now ventured into the garden, and provided an out-door ink especially suitable for garden labels. By means of an ordinary fine-nibbed pen the name of a plant may be written in legible characters on labels of wood, metal or celluloid. If allowed to dry, the ink will not "run," and the makers state that it is waterproof and unfading—qualities the gardener will greatly appreciate.

THE Advisory Committee provided for in Section 23 of the Fertilisers and Feeding Stuffs Act, 1926, has now been appointed jointly by the Minister of Agriculture and Fisheries and the Board of Agriculture for Scotland. Its constitution is as follows:—Lord Clinton (Chairman), Mr. E. Richards Bolton, F.I.C., Mr. E. G. Haygarth Brown, I.S.O., Dr. Charles Crowther, M.A., Ph.D., Mr. J. Garton, Mr. C. W. Higgs, Mr. Arthur Holgate, Mr. Thomas Kyle, Mr. Alexander Main, M.A., B.Sc., Mr. John C. Menzies, Mr. Brian S. Miller, Lt.-Col. R. L. Norrington, C.M.G., Mr. J. W. Pearson, Mr. R. R. Robbins, C.B.E., Dr. G. Scott Robertson, D.Sc., Sir E. J. Russell, O.B.E., D.Sc., Mr. John Speir, Mr. George Stubbs, C.B.E., Dr. J. F. Tocher, D.Sc., Dr. J. A. Voelcker, M.A., D.Sc., and Professor T. B. Wood, C.B.E., M.A. Mr. H. J. Johns, of the Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W.1, is the Secretary. The immediate duties of the Committee will be to prepare recommendations as to the regulations which will require to be made before the Act can come into operation and to consider a number of suggestions with regard to the contents of the Schedules to the Act.

## ADVERTISE BOLDLY!

An expensive advertisement usually turns out the cheapest in the end. Big type in advertising means big business; so let your slogan be

## ADVERTISE BOLDLY!

## COLOUR PLANNING OF THE GARDEN

By G. F. Tinley and others, with an introduction by Miss Gertrude Jekyll.

FIFTY COLOURED PLATES

Price 42/- net (plus postage 1/-)

Colour in the garden! After the dark, dull winter, we all cry out for this. In this unique volume, three hundred lovely flowers are grouped and illustrated in their own natural colours, and thousands of other plants are fully described for the benefit of all who wish to have a garden of their favourite hue.

**GARDENERS' CHRONICLE  
LIMITED**

5, Tavistock Street, Covent Garden, W.C.2

## SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## MUNICIPAL AND PUBLIC.

SURBITON URBAN DISTRICT COUNCIL.  
TO GARDEN KEEPERS, GROUNDSMEN and OTHERS

THE above Council require for their Alexandra Recreation Ground a HEAD GROUNDSMAN with a special knowledge of the upkeep of Sports Grounds, including Bowling Greens (Cumberland turf), Lawn Tennis Courts, Cricket Pitches, Football Pitches, etc., and should also have a good practical knowledge with regard to Flowers, Shrubs, Trees, etc.

Fee for having replies addressed to the office, **1s.** over and above the amount payable for all words appearing in the advertisement, including our own address.

### SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter, or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or if received after Wednesday cannot, be inserted the same week: but if fully paid, it will appear the following week, unless countermanded in the meantime.

## PRIVATE.

**BAILIFF** or **STEWARD**, farm, garden, private or commercial; age 50; life's practical experience; no family; highly recommended. Pay own removals.—**A. W. G.**, Box 67, 5, Tavistock Street, Covent Garden, W.C.2.

A mature  
firm that  
makes mature  
Glasshouses

\* \* \*

Two 'Williams' distinguished  
themselves in the year  
1830. William the fourth  
came to the English throne  
and William Duncan Tucker  
founded the firm that bears his  
name to-day.

With the former William we  
are not concerned.

But the firm of William Duncan  
Tucker and Sons, Ltd., is

essentially up-to-date. Nigh-a-  
century-old. Yet a hundred  
years young. Up go their  
Glasshouses, each one scientifi-  
cally designed and carefully  
constructed. Repair as well  
as creative work absorbs their  
energies.

In every job, though, their  
maturity is reflected in the  
work they accomplish. Drop  
them a line about your needs.

## RHODODENDRONS FOR EVERYONE

By F. KINGDON WARD.

PRICE - 3s. 9d. - POST FREE.

This fascinating work, published in 1926, has already proved exceedingly popular, and is rapidly commending itself to the gardening public, many of whose members are finding how much easier is the cultivation of these delightful flowering shrubs than they had imagined. There are very few gardens where they will not grow and flourish with ordinary, common-sense treatment, and their glorious blossoms are a perpetual feast to the eye. Capt. Kingdon Ward writes with authority, for he knows his subject at first hand, having had seven or eight years' experience of travelling in China and Tibet, where he discovered a number of new Rhododendron species.

Send for a copy to-day, to:

well worth a visit.

## COLOUR PLANNING OF THE GARDEN

By G. F. Tinley and others, with an  
introduction by Miss Gertrude Jekyll.

FIFTY COLOURED PLATES

Price 42/- net (plus postage 1/-)

Colour in the garden! After the dark,  
dull winter, we all cry out for this.  
In this unique volume, three hundred  
lovely flowers are grouped and illus-  
trated in their own natural colours,  
and thousands of other plants are fully  
described for the benefit of all who  
wish to have a garden of their  
favourite hue.

## HEDGE CLIPPING

made easy  
with the

"**LITTLE  
WONDER**"

A practical machine that will  
clip any variety and shape  
of hedge five to ten times as  
fast as the hand shears. It  
will do better work and make  
finer hedges with much less  
effort. Ten feet high hedges  
may be clipped right from  
the ground. Easily adjusted  
for top-cutting.

Strong, durable, efficient—a perfectly made and  
finished labour-saving machine that saves you  
money every time it trims a hedge.

The "LITTLE WONDER" Hedge Clipper has  
been used at the Royal Horticultural Society's  
Gardens at Wisley since 1924, and holds

**THE AWARD OF MERIT BY THE R.H.S.**

Used in the Royal Zoological Society's Gardens  
and many large estates throughout the country.  
Demonstrations arranged. (Free of duty for Ireland)

## Stock and Scion of Apples.\*

THANKS to the pioneer work done at East Malling, fruit growers have been provided with a series of stocks for Apples, each of which possesses known and definite peculiarities. From the many categories of stock previously mixed up in hopeless confusion and described as Paradise, many different types have been sorted out, and the special peculiarities and virtues of each stock have been ascertained. This in itself is a notable achievement, and one of which British pomologists have good reason to be proud. Mr. Hatton who was, with Captain Wellington, responsible for this pioneer work has now carried his investigations a step further. By means of laborious and exhaustive observations of growth and cropping behaviour, he has demonstrated the overwhelming influence which kind of stock has on the growth and cropping of a given variety of Apple grafted or budded upon it. For full details of

this arduous and valuable investigation, the current number of the *Journal of Pomology* must be consulted; but the salient facts are summarised here. In these experiments the influence of sixteen different stocks is described. Each kind of stock was raised or increased vegetatively, and hence all the members of one kind may be regarded as being to all intents and purposes identical with all the others of its kind. The scion budded or grafted on each of these stocks was Lane's Prince Albert. Elaborate measurements and records were kept each year of the growth and cropping performance of each of the large number of trees included in the experiment. The records concern total wood growth, height, spread, girth, number of fruit spurs, of blossoms set and fruits produced. The results prove that these laborious observations were well worth while, for in no other way could the profound influence of stock on scion have been demonstrated, and in no other way could the intelligent nurseryman or fruit grower who seeks to make his art as perfect as possible, learn how he may achieve this worthy object. The extraordinarily great influence of stock on scion is best illustrated by a comparison of the growth and cropping behaviour of Lane's Prince Albert on the most dwarfing and on the most vigorous stock. On Type No. IX (Jaune de Metz) the trees made growth just five times as little as they did on the more vigorous stock, Type XII. The recorded ratios are: 46.9 to 233.2. A similar difference is exhibited in height attained, 132, 275; in spread of branches, 176, 278; and in girth, 109, 237. When, however, we turn to the cropping performance, a different picture is seen. Type IX formed on the average during the six years, 231 fruit spurs, set a relatively high percentage of its blossoms, and yielded (in the seventh year) an average of 112 fruits; whereas its more vigorous fellow (No. XII) produced an average of only forty-nine fruit buds, set a much lower percentage of its blossoms, and yielded only ten fruits. No doubt its fruitful time is yet to come, but evidently Type No. IX is the stock to use for fillers, that is to say, for interplanting between permanent trees to produce some returns in the early days of the orchard. No less interesting is the fact demonstrated by these experiments that the sixteen types of stock form a series which shows a gradually increasing vigour. Of these types, however, some seem to stand out conspicuously in combining vigour with fruitfulness. Thus Type No. II is twice as sturdy of growth as is Type No. IX, and about half as fruitful, but Type No. I, half as sturdy again as No. II, is just as fruitful. Thus though vigour of growth and fruitfulness are, as everyone believes, more or less incompatible qualities, this is not invariably the case for, as just shown, it is possible to find a stock which encourages a markedly vigorous growth and yet admits of a fairly high degree of fruitfulness. These observations are bound to prove of the greatest value to our nurserymen and to fruit growers generally. By studying them carefully and in detail, it is possible for the nurseryman to decide which are the stocks to use for the different kinds of customers who go to him for maiden or formed trees. There are stocks for all requirements, for the little garden, for the gardener who wants quick returns, and for him who is prepared to wait. To show how profitable may be the waiting period, Mr. Hatton has included a table (p. 11) indicating the number of fillers which may be used per acre and the yield to be expected. With Type No. IX there would be 504 fillers per acre, and they should yield

in seven years 1,000 bushels of Apples. If Type No. II be used, the 268 fillers required would yield about 600 bushels, and so on. There is, of course, much still to do before science can fulfil the part it is destined to play as guide, philosopher and friend of the art of horticulture—but Mr. Hatton is pointing the way, by following which, science may ultimately play this worthy part.

**Plants of Special Interest at Kew.**—The small glasshouse, at the Orchid-end of the T-range, continues to attract its quota of visitors to the Royal Botanic Gardens, Kew. To the general plant lover it is the Cyclamens that are of most interest, and the older plantmen who go there cannot fail to be delighted to see the original type plant with its perfectly-formed flowers. The type-written note which is placed by the group reminds the visitor that the proper specific name of the greenhouse Cyclamen is *indicum*, though it is more commonly known as *C. persicum*. The various colour varieties, which range from white, through rose-pink and salmon-pink to red and purple, and the different types of flower, all of which were obtained from *C. indicum*, are represented by good specimens of each colour and shade. In No. 4 house, known to the general public as The Conservatory, there is a more extensive collection of Cyclamens. These are all particularly well-grown plants, and we were pleased to see that so many plants of the Kew strain more nearly approximate the type in their beauty of form than is usual now-a-days, when the large-flowered sorts are more or less shapeless. As is right and proper in an educational establishment, the crested varieties are represented but, happily, by few plants. Next in garden interest to the Cyclamens, in the Special House, is the collection of Citrus fruits from the Italian garden of Commendatore Cecil Hanbury. These are the fruits which were exhibited recently at the R.H.S. Hall. A prominent notice warns the visitor that "These fruits have been treated with a poison"; no doubt a necessary precaution. There are various economic plants, such as the Clove (*Eugenia caryophyllata*), Tea (*Camellia Thea*), Paraguay Tea (*Ilex paraguayensis*), Coffee (*Coffea arabica*), Bread Fruit (*Artocarpus incisa*), Cacao (*Theobroma Cacao*), Chicle Gum (*Achras Sapota*), Quinine, West African Rubber, Cocaine, Ipecacuanha and Gum Balata.

**Summer Show at the Birmingham Botanical Gardens.**—After a lapse of many years, due to the incidence of the war, the Birmingham Botanical and Horticultural Society has decided to hold a three days' Flower Show at the Botanical Gardens, Edgbaston, on June 1, 2 and 3 next. Cups and medals will be awarded to trade growers and prizes and certificates to amateurs. It is proposed to engage a military band and to have a public opening ceremony each day. A committee has been formed and a meeting will be held at the Botanical Gardens, Edgbaston, on Friday, March 11, at 5.30 p.m., to which all interested are cordially invited. A schedule of prizes will be distributed so soon as possible; two Silver Cups have already been offered. Further information will be gladly given by Mr. T. Humphreys, Botanical Gardens, Edgbaston.

**The Leaf-Cutting Bee.**—Rev. George Birnie, B.D., Speymouth Parish Church, one of the most learned and erudite authorities on such matters in the north, in the course of a lecture on "Nature's Architects," delivered in the old cathedral City of Elgin recently, gave the following delightful pen picture of *Megachile rosea*, the Leaf-cutting Bee. The upholsterer, as the lecturer named it, is very selective of its material, preferring Rose leaves to everything else, only taking Birch, Rowan or Dog Mercury, when there is no Rose bush within half-a-mile. The leaf-cutter is a very interesting subject to study. It scrapes a hole for three inches or so into a sand-bank facing south. Then it searches out a Rose bush, sometimes selecting

\* The Influence of Different Root Stocks upon the Vigour and Productivity of the Variety Budded or Grafted Thereon, by E.G. Hatton, East Malling Research Station. *Journal of Pomology*, Vol. VI, No. 1, February, 1927.

one out of a hundred and taking no other. Its scissors consist of equally-formed mandibles or jaws, and when it lights upon the Rose leaf it takes the serrated part between its legs and with marvellous deftness and rapidity clips, it may be a perfectly circular or oval piece out, forcing its head along the cut till it reaches the point when only a tiny part remains unclipped. To prevent it breaking away, the insect, at the correct instant, sets its wings in motion, thus balancing itself as it completes the operation, when it flies away with the piece between its legs. Arrived at the hole it had scraped out, it rolls the piece up between its legs into a cylinder, and can then drag it into the small hole to lay the foundation of the thimble-formed case. One piece after another it brings, packing each into its place with its powerful legs and feet, the one always overlapping the other, until the case is completed, and then an egg is laid and provision made for the future little one in the shape of a pellet of pollen mixed with honey, usually from Thistles, which gives it a rosy colour. Then comes the marvellous piece of neat fitting. It may have to fly a quarter-of-a-mile from its nest to the favourite Rose bush, and there cuts out a perfect circle as a lid—the correct size—to close the egg in the case. Examination of these cases will discover the microscopic exactness with which the female leaf-cutting bee packs in her eggs and pollen pellets, not with one, but three, circular, perfectly-fitting lids. Then she proceeds with another, and another case, until she has three or four, end to end, the lid of the one forming the foundation of the next, and all this wonderful work is done in the dark!

**Seven Sisters Cliffs, Eastbourne.**—We are glad to learn that the Seven Sisters Cliffs, and the Downs behind, have been saved for the National Trust. Mr. W. C. Campbell, of Eastbourne, is stated to have lent the remaining £5,000 of the £18,000 required to purchase the land, which was to have been used for building.

**Fewer Apples and Pears from New Zealand and Australia.**—The Empire Marketing Board has received a cable from the Director-General of Agriculture in New Zealand stating that the export of Apples to the United Kingdom during the coming season is estimated at 500,000 boxes and of Pears at 10,000 cases. Last season exports to the United Kingdom were 655,000 boxes of Apples and 9,400 cases of Pears. The Apple and Pear crops are lighter than usual in Australia this year. An unofficial estimate suggests an export of 1,400,000 boxes of Apples against 3,175,000 boxes in 1926. The shipping programme of Tasmania alone is for a total export of 1,151,000 boxes of Apples and Pears during the coming season against 2,147,000 cases of Apples last year.

**Kew Trees for Canberra.**—During the ceremonies at Canberra, the new capital of Australia, the Duke and Duchess of York will assist in planting various trees which have been sent out from the Royal Botanic Gardens, Kew. Around the new capital the conditions are too arid for any possible hopes of success, so the trees will be planted on the adjoining hillside. On December 20 last a consignment, consisting of eight Beeches, eight Oaks, eight Horse Chestnuts, six Elms, six Alders and six Cricket-Bat Willows, with a bundle of Willow cuttings, were sent per s.s. Balranald to Mr. Ward, the Curator of the Sydney Botanic Gardens, who will care for the trees in the meantime. There will be a ceremonial planting, and it is expected that the Duchess will plant the Elms, the Duke the Oaks, the Governor-General the Beeches, and the Prime Minister the Cricket-Bat Willows.

**Retirement of Jakob Plohowitz.**—Many English readers who have visited Vienna, and admired the beautifully designed and well-kept public gardens there, will be interested to learn that Herr Jakob Plohowitz, the head of the Parks Department, has just entered into retirement. His successor is Herr Fritz Kratochwilj, who entered the service of the Viennese municipality in 1903, and has worked his way up gradually to his present important position. He has also been, since 1923, General Secretary of the

Austrian Horticultural Society, not an easy position and one that has called for considerable organising ability owing to the great difficulties experienced since the war.

**Mr. F. W. Thurgood.**—Anyone who can cultivate Orchids successfully and continuously for a period of twenty-eight years in London, deserves commendation for the skill and patience he exercises. Such a one is Mr. F. W. Thurgood, who has had charge of Mr. H. T. Pitt's fine collection of Orchids at Rosslyn, Stamford Hill, over the period named. Regular visitors to the Royal Horticultural Hall know how well and consistently the Rosslyn Orchids are exhibited there in a condition that would shame many growers who experience the brighter conditions and purer air of the country. Like many other successful cultivators, Mr. Thurgood has had a varied and wide experience, and this, coupled with keen powers of observation and a deep love for plants, has enabled him to grow Orchids where many another would fail. Deriving from a family of farmers, Mr. Thurgood chose horticulture as his profession and served as a

MR. F. W. THURGOOD.

boy in the gardens of Terling Place, Lord Raleigh's Essex estate. Here, and subsequently, he was employed in various departments of the garden, but it was Mr. Bowring's large collection of Orchid species at Forest Farm, Winkfield, that excited his enthusiasm. When Mr. Bowring's establishment was broken up, Mr. Thurgood entered service with Messrs. Sanders, of St. Albans, where he made the acquaintance of seedling Orchids and their needs. His next position was that of foreman to William Thompson, Esq., at Walton Grange, Stone, Staffordshire, where a splendid collection of Orchids was maintained in fine condition over a long period—a collection many of the older Orchid enthusiasts remember with pleasure. Three years later Mr. Thurgood took charge of the Orchids at Waddesdon Manor, the seat of the late Baron Ferdinand de Rothschild; here he remained three years before entering the service of Mr. Pitt, Stamford Hill. His employer is a great lover of Orchids and has a great affection for species as well as the showier hybrids. At Rosslyn there are specimens of *Dendrobium Wardianum album*, *Odontoglossum grande*, Pitt's variety, *O. crispum*, *O. Londesboroughianum* and *Laelia Jongheana*, which have been grown there continuously for five-and-twenty years, while the rare *Eulophiella Elizabethae* continues to thrive, and the rarer hybrid *E. Rolfeae* came into the collection in 1893. Mr. Pitt and Mr. Thurgood hold a remarkable record, as the Orchids they love so well have won about two hundred medals in London and Manchester. Moreover, the Rosslyn Orchids have won the Amateur Orchid Challenge Cup,

a special Cup at Chelsea in 1926, and the Lindley Medal for *Eulophiella Rolfeae*.

**Wisley Trials.**—The Royal Horticultural Society will carry out trials during this year of large-flowering Gladioli, alpine Phloxes, and Rhubarb. Three plants of each variety of alpine Phlox, and of Rhubarb, and ten (or five) corms of each large-flowering variety of Gladiolus should be sent to reach The Director, R.H.S. Gardens, Wisley, Ripley, Surrey (Goods via Horsley Station, Southern Railway), on or before March 31, 1927.

**Crocus minimus, Dyke's variety.**—At the meeting of the Royal Horticultural Society held on February 22, a very fine form of *Crocus minimus*, shown by Mrs. W. R. Dykes, received an Award of Merit, subject to the plant being given a varietal name. The variety has now been named "Dyke's variety."

**Dischidia Rafflesiana.**—This interesting "pitcher-plant" is the subject of an article, illustrated by an excellent photograph, in the February issue of *Gartenschoenheit*. The article, which is by Mr. J. A. Purpus, describes in detail the structure and cultivation of the species, which is a native of the Malay States and tropical Australia. The plant produces, in addition to normal leaves, hollow structures provided with apertures through which the moisture of the atmosphere gradually percolates, and fills the "pitchers." On the slender, thread-like leaf-pedicels little roots are formed, which reach into the pitchers, form a net-work there, and convey to the plant the life-giving moisture. The normal foliage is thick, fleshy, roundish or heart-shaped, and one-and-a-half to two cm. across; the pitchers are much larger, eight or nine cm. long by three or four wide, and so disposed as most easily to catch the atmospheric moisture, of which each holds about ten cubic centimetres. Often small organisms are drawn into the pitchers with the moisture, and drowned insects have been found there. Although the cultivation of this plant is not really difficult, it is rarely seen except in botanic gardens, and then usually as poor specimens, which last only a few years. They require a high temperature and atmospheric moisture, even in the winter, during their resting period. During the vegetative period frequent overhead sprayings with rainwater are necessary—in fact, *Dischidia Rafflesiana* may be treated almost exactly like *Nepenthes*. As they are climbers, and also root-climbers, they require a support to enable them to perform this function; a framework of rough rustic work, well-furnished with twigs on which some *Polypodium* fibre has been fastened, appears to be suitable. To cover the whole structure with *Polypodium* is likely to do more harm than good, as the roots ramble best over the bare wood. Once the roots are established, the plant makes rapid progress, and often develops a great number of pitchers in a few years. Mr. Purpus considers the best wood to use for the support is that of *Robinia Pseudacacia*, which is lasting, rough-barked, and not readily liable to decay.

**Gardening Lectures at Chiswick.**—A series of four lectures will be given at the Chiswick Public Library under the auspices of the local Library and Museum Committee. The dates, subjects and lecturers are as follow: March 17, Vegetables for Gardens and Allotments, by Mr. W. H. Johns, N.D.H.; March 24, Lilies and other Bulbous Plants, by Mr. John Weathers; March 31, Carnations, by Mr. Montague C. Allwood; April 5, Plants for Shady Places, by Mr. W. Stewart, Superintendent of the Chelsea Hospital Gardens.

**Preservation of Ancient Cottages.**—Many influential persons were present at a conference on The Preservation of Ancient Cottages, held on January 26, at the Royal Society of Arts. The Prime Minister, who presided, stated that it was difficult to contemplate the survival of the beautiful old cottages of England without realising that the whole of this architecture is one of the tributaries of the main stream of medieval craftsmanship which has come down to our time, and as such, is of inestimable value to us. We have to see if we cannot once again tap those springs of

craftsmanship which has not flowed in this country for so long. It is not a hopeless task because craftsmanship lies dormant among our people. He said he is quite certain that if the right magician's wand were used it would spring again into fertile being throughout the length and breadth of the country. The Rt. Hon. Earl of Crawford and Balcarres, speaking on behalf of the Society of Antiquaries, said that no building which is used as a residence comes within the purview of the Ancient Monuments Act. The country cottage, therefore, except when abandoned and derelict, cannot be a candidate for support out of State funds under the Ancient Monuments Act. He said that the recent report issued by the Royal Commission on Historic Monuments of Huntingdonshire showed that in villages which were rather remote there were cottages dating back even to Tudor times. He also said that

as a matter of course. The Committee is anxious to raise a fund of £50,000; a list of subscriptions read out by the Secretary of the Society, John Street, Adelphi, W.C.2, amounted to £1,855 13s.

**Gardeners' Royal Benevolent Institution Festival Dinner.**—Lord Treowen will preside at the eighty-second Annual Festival Dinner in aid of the funds of The Gardeners' Royal Benevolent Institution, on June 29. The Dinner will be held at New Princes' Galleries, Piccadilly.

**In Memory of Tennyson.**—Lord Tennyson has presented 155 acres of High Down near Farringford, in the Isle of Wight, to the National Trust in memory of his father, who in his late years walked on these Downs almost every day. The Downs command a magnificent view of the Freshwater country, and on the highest point is a beacon, erected to the memory of the poet. The land that has been gifted is to be known in

may prove to have practical value for winter spraying. The toxic properties of extracts of some tropical plants have also been studied.

**Appointments for the Ensuing Week.**—**SUNDAY, MARCH 6:** Wakefield and North of England Tulip Society's meeting. **MONDAY, MARCH 7:** Romsey Gardeners' Association's meeting. **TUESDAY, MARCH 8:** Royal Horticultural Society's Committees meet (two days); Horticultural Club Annual Meeting and Dinner; Jersey Gardeners' Society's meeting; Wimbledon Gardeners' Society's meeting. **WEDNESDAY, MARCH 9:** Sheffield Chrysanthemum Society's meeting; Pangbourne and District Gardeners' Mutual Improvement Association's lecture. **THURSDAY, MARCH 10:** Ipswich Gardeners' Association's meeting. **FRIDAY, MARCH 11:** Orchid Club meeting; Royal Horticultural Society of Ireland meeting.

FIG. 77.—DENDROBIUM RENOWN VAR. ARMSTRONGIAE.

R.H.S. Award of Merit, Feb. 22. Flowers rich purple, rose and buff. Shown by Messrs. Armstrong and Brown. (see p. 152).

the Council for the Preservation of Rural England, which has recently come into existence, seeks to maintain the charm, the amenity and the intimacy of our English country landscape and the Council looks upon these old world cottages as something indigenous to the countryside, something racy of the soil, something which represents the gradual evolution and development of our race and worthy of preservation. It is hoped to treat these old cottages, assuming the structure to be sound, in such a manner as to ensure that after treatment the cottage on the one hand will preserve intact its original character, and on the other, that the cottage so far as sanitation and comfort are concerned, will be worthy of its occupants. The Rt. Hon. Sir Alfred Mond said that every old cottage and every beautiful thing which is maintained, must train the eye more and more to reject the ugly and unaesthetic, so that eventually people will not want to live in, or tolerate, ugliness,

future as Tennyson's Cliff and Down. The poet Tennyson went to Farringford in 1853, when he was forty-four years old, and his associations with Aldworth were in his later years. He was sixty years of age when he built his house at Farringford.

**Contact Insecticides.**—At the February meeting of the Association of Economic Biologists, Messrs. F. Tattersfield and C. T. Gimmingham stated that in the course of laboratory and field experiments on contact insecticides an apparatus and technique have been devised for the quantitative study of the toxicity of contact insecticides, both to adult insects and to insect eggs, also that some relationships between chemical constitution, and toxicity in certain groups of synthetic organic compounds have been worked out. The results of the laboratory work have led to experiments in the field with certain compounds, highly toxic to insect eggs, which

**"Gardeners' Chronicle" Seventy-five Years Ago.**—Messrs. Chandler's Nursery, Vauxhall.—Lovers of Camellias will be glad to learn that the extensive collection of this favourite flower, for which this nursery is celebrated, is now in full bloom. When we state that they form a bank, 160 feet in length, and some eight or ten feet deep, some idea will be gathered of the kind of entertainment which it may be expected a visit to so large a display will afford. Red kinds, as *altheaeflora*, *Chandlerii*, *Woodii*, *imbricata*, etc., are abundant and fine, and the old double whites have flowered better this year than usual, few of the buds having dropped, a circumstance perhaps to be attributed to the mild winter having caused less fire-heat to be employed, and therefore to the air being more moist and congenial to the health of the plants. The whole collection is neatly arranged, and in excellent condition. *Gard. Chron.*, March 6, 1852.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Miltonia.**—Many hybrid Miltonias have been raised during late years, and the introduction of bright colours into this family of plants makes them most desirable for the embellishment of the plant houses; although they are not suitable for use as cut flowers, it is remarkable how long these plants will remain attractive when in bloom when used for indoor decoration, provided they are suitably hardened by first placing them for some time in a cool house.

**Repotting.**—This work will now become general, as the different species will commence to develop roots and new growths, although, in a general collection there is some repotting that may be done at all seasons. A plant that is making new roots may safely be repotted any time, provided it is watered with care. The success attending the cultivation of plants depends entirely on their health and vigour, and no plant can thrive if the compost in which it is growing is decayed, hence the desirability of repotting each plant at its proper season. The provision for drainage must in all cases be ample, as no plant will succeed in a waterlogged and sour compost. In potting the plants the material should be placed carefully between the roots, making sure they are not crowded, but distributed regularly in the receptacle. Tall plants should be staked neatly to ensure their being held firmly in the soil, as a plant that moves in its pot cannot root satisfactorily.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTREE, Horsley Hall, Gresford, N. Wales.

**Tomatoes.**—Young Tomato plants that need more root space should either be potted on into larger receptacles or planted into boxes, which I prefer, as far better crops may be obtained with the use of boxes, as well as time saved. Strong boxes, three feet long, one foot wide and the same in depth, are suitable. They should be well-drained and the crocks covered with rough pieces of good, turfy loam. The boxes should then be rather more than half filled with a compost consisting of four parts good, fibrous loam, one part burnt refuse from the garden fire, a liberal sprinkling of lime rubble and bone-meal, and a dash of soot. When placing the Tomatoes in the boxes, it is well to have the soil on the dry side so that it may be made firm. Maintain a temperature of about 60°, and whenever possible admit a little fresh air in the house to keep the atmosphere dry and circulating. Endeavour to obtain short-jointed, fruitful plants. So soon as the flower trusses are well expanded and showing plenty of pollen, it is a good practice to give the plants a sharp tap each midday to assist fertilisation. By the time the fruits of the earliest bunch commence to swell, the first top-dressing should be placed over the roots, which will be showing on the surface; the compost for this purpose should be richer than that used at the time of planting. Top-dressings should be applied at intervals until the boxes are filled to within an inch or so of the top.

**Shallots.**—This crop should now be planted in well-prepared ground. Choose a sunny position. The cloves should be planted in rows made fifteen inches apart and twelve inches apart in the rows. Do not plant too deeply; leave the top of the Shallot well above the soil.

**Transplanting Winter Onions.**—Presuming that the ground intended for this crop has been well trenched and manured, it should now be prepared, when workable, by adding a good

dressing of burnt refuse and soot. These materials should be well raked into the soil, which should then be trodden firmly and again raked over to ensure a good tilth in readiness for setting out the young plants. Lift the seedlings carefully and plant them very firmly in rows fifteen inches apart, allowing nine to twelve inches between the plants. These Onions, if attended to, should produce fine bulbs, suitable not only for the table, but also for early exhibition purposes.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brocket Hall, Hertfordshire.

**Clorodendron Balfouri.**—Plants of *C. Balfouri* that have been kept somewhat on the dry side may now be watered and started into growth. These useful plants may easily be increased from cuttings, and so soon as the young growths are about four inches in length they should be inserted in a sandy, open compost and stood in a propagating frame. When rooted, they should be potted on as they become ready, and finally placed in eight-inch pots. Treated in this way they will make excellent flowering specimens for next year. The compost should consist of good turfy loam, peat or leaf-mould, mixed with a liberal quantity of silver sand. Older plants may have some of the surface soil removed and be given a top-dressing of rich compost; see that the drainage is efficient.

**Solanum Capsicastrum.**—This useful berried plant is most valued for indoor decoration during the winter. Seeds may be sown now, or where a good strain of this *Solanum* exists, the plants may be propagated from cuttings. The seedlings or cuttings should be kept growing freely in the early stages to allow for the growths to be pinched several times to promote a bushy habit. During the summer the plants may be stood in a cold frame and the lights removed except when heavy rain falls.

**Acalypha Sanderi.**—Old specimens of *A. Sanderi* that have become somewhat overgrown may be cut back and placed in a house where a night temperature of 60° can be obtained, to encourage the development of young growths suitable for use as cuttings. The latter may be inserted when they are from four to five inches long in sandy soil and stood in a propagating frame where they will soon form roots. A few of the more robust plants may be potted on to form large specimens. This species needs liberal supplies of liquid manure when the receptacles are well-filled with roots. Syringe the plants freely to ward off attacks of red spider.

**Euphorbia.**—*Euphorbia jacquiniæflora* and *E. pulcherrima* (syn. *Poinsettia pulcherrima*) are two of the most useful plants grown for winter decoration. They should be cut hard back after flowering and kept somewhat on the dry side for several weeks, when the roots should be watered to induce young growths to form, suitable for use as cuttings. During their resting period it is not wise to place the plants in a house having a very low temperature, especially *E. jacquiniæflora*, for this plant requires a temperature not lower than 50°; this applies to pot-grown plants.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Mulberries.**—Large Mulberry trees usually produce excellent crops of fruits which are very useful for tarts, while large, well-ripened, clean berries are greatly appreciated by many as dessert. The trees are best planted in grass so that when the ripe fruits fall from the trees they will not be soiled. Young trees that are forming heads should be relieved of the numerous ill-placed sprays forming along the branches and the young shoots selected to form the future tree given every encouragement to develop. Old trees should receive a liberal

dressing of manure over the roots, and do not overlook the support of the main branches against heavy storms, for the wood is very brittle.

**Figs.**—In cold districts, where some amount of protection has been afforded these trees, the protective material should now be removed and the pruning and regulating of the main branches finished forthwith. If the pruning and disbudding of the trees were attended to last summer the main fruiting shoots should be well-ripened and these may be laid in at a reasonable distance apart. Do not crowd the branches, as by far the best and most satisfactory crops of fruits are produced on trees the shoots of which are not too thick. After the pruning and nailing are completed, old trees should be well top-dressed with a mixture of loam, lime-rubble and a sprinkling of bone-meal. The feeding of the roots should be regulated according to the strength of the yearly growths. Brown Turkey is one of the very best and most dependable varieties to grow. Those who intend to plant Figs this spring should see that the soil is not too rich, the border well-drained and not too wide. Figs do best in a firm, restricted root-run. When they are in full bearing and the borders well-filled with roots, the latter may be fed with liquid manure at intervals during the summer.

**Peaches, Apricots, etc.**—The netting or other material used for protecting fruit blossoms should be examined and mended in readiness for use. Where glass coping exists, not much difficulty is experienced in sheltering the flowers, and usually the crops of fruit are satisfactory. But good crops can be obtained with very slight protection if the wood is ripe and the flowers produced are strong. A couple of thicknesses of fish-netting supported by clean poles placed in the ground three feet from the wall, with the tops resting on the brickwork, will suffice in this case.

### THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic  
Gardens, Kew.

**Zephyranthes candida.**—This plant is a native of Buenos Ayres, and usually grown in a greenhouse, but in the south it is undoubtedly hardy, and used as an edging plant in various gardens. It has evergreen foliage and produces its white, Crocus-like flowers in wonderful profusion, during late summer and autumn. It may be planted any time during the spring and on dry, warm soils increases very quickly. It is known as the Peruvian Swamp Lily, and although with us it is indifferent to prolonged spells of dry weather, it is noticeably greener and stronger in spots where leakage from water taps or pipes occurs.

**Pruning Roses.**—The pruning of Roses may be commenced from the beginning to the middle of March, according to the locality of the garden, dealing first with the hybrid perpetuals and hardier hybrid Teas. Towards the end of the present month and beginning of April the more tender hybrid Teas, standards and Tea varieties may be attended to, finishing the work generally towards the end of April. Roses planted last autumn should be pruned to within three or four buds at the base. In the case of established Roses, no hard and fast rule can be laid down, although it is a fairly safe guide to prune weak-growing varieties hard, and the stronger-growing ones lightly. The weaker-growing, dwarf Roses should be pruned back to about three or four buds from the base; the same general rule applies to Roses grown for exhibition, which should be pruned harder than those grown for bedding or decorative purposes. The stronger-growing varieties should be more lightly pruned; in some cases the shoots, if they are firm and well-ripened, may be left twelve inches long. It is important to cut back to firm, well-ripened wood and the dormant buds, even if it necessitates cutting the plant to the ground line, as has often to be done in the case of some of the more tender Tea Roses.

If it can be spared, at least one old shoot should be cut right down to the ground level every year. Some of the very strong-growing varieties that make growths six feet and eight feet in length, give only their best effect when in bloom when the shoots are pegged almost their full length to the soil. This results in lateral growths developing from each bud the entire length of the shoots. If it is necessary to retain any of the last year's shoots to furnish the bush the laterals made last year should be spurred back to within two or three buds of the base. A few Roses suitable for pegging are Hugh Dickson, Ulrich Brunner, Lady Waterlow, Gustave Régis, Frau Karl Druschki, J. B. Clark, Pax and Conrad F. Meyer. Roses planted at this late date should be pruned hard back. Where mildew was bad last season spray the bushes with liver of sulphur after pruning them, using half-an-ounce of the liver of sulphur to one gallon of water.

manure should be applied, but the soil should not be packed too tightly on the surface, for warm, diluted liquid manure is required to pass freely through the pots to the roots. The houses in which Fig trees are grown in restricted borders for successional fruiting may be kept at 55° to 60° by night and 10° higher by day with fire-heat. As the season advances considerable progress may be made by closing the house early with warmth from sun-heat, and plenty of atmospheric moisture. Syringe the trees twice daily with tepid water and occasionally with clear soot-water, but only once when the weather is dull. Pay careful attention to watering and both the water and the liquid manure should be 5° warmer than the soil of the border in which the trees are growing. Remove all superfluous side-shoots to prevent crowding of the branches, but at the same time make certain that the tree is properly furnished with short spurs.

also be grown on north walls, and such bushes furnish a most acceptable crop of late fruits.

**Pruning Autumn Flowering Shrubs.**—The pruning of certain shrubs which flower in autumn should now be done; these include *Buddleia variabilis* and its varieties, which produce much larger and finer panicles of flowers when hard-pruned in spring; the beautiful *Ceanothus Gloire des Versailles*, *Hydrangea paniculata*, *Romneya Coulteri*, and plants of a similar type, all of which will be greatly improved by the judicious use of the knife at this season. The *Romneya* should be cut well down in order to encourage strong shoots to develop from near the base; these basal growths may reach a height of six feet or seven feet during the season, and produce a splendid display of flowers during August and September. The autumn-flowering *Clematis*, of which *C. Jackmanni* may be taken as a type, should also be cut back

FIG. 78.—EARLY-FLOWERING CHRYSANTHEMUMS MRS. J. PEARSON AND WHITE BOY.

(see p. 160).

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Early Figs.**—So soon as the fruits on early pot trees have completed their first swelling, their development for a period of about three weeks will be imperceptible, but if the roots are healthy good progress will be made. In dealing with these fruits at this stage the greatest care is necessary; anything approaching a check caused by dryness at the roots and sudden changes in the temperature is sure to be followed by the fruits dropping. A night temperature ranging about 60° should be maintained, whilst the day temperature may average 70° with the use of fire-heat, and up to 80° on bright, sunny days, with plenty of fresh air and atmospheric moisture. Close the house early in the afternoons and syringe the plants liberally when the fruits begin to swell. If the bottom-heat is maintained at about 70° to 75°, forcing will be safer and easier, and a few degrees higher by night and day will do no harm. The Fig is a gross feeder, and rich top-dressings composed of rough pieces of turf, bone-meal and decayed

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF  
AILSA, Culzean Castle, Maybole, Ayrshire.

**Nailing on North Walls.**—Fruit trees on north walls, including Morello Cherries, Gooseberries, Red Currants and White Currants, should now be pruned and tied or nailed to the wall. The training of Morello Cherries is a cold operation during frosty weather, and can only be performed advantageously when the temperature rises sufficiently high to prevent the fingers and toes from becoming numbed. It is, therefore, advisable to have some other more active occupation running concurrently to which attention may be more profitably turned during the morning hours. The young wood should be trained in, leaving room for the current season's shoots. Only the exhausted, older wood should be removed in the case of the Morello Cherries, while Gooseberries and Currants occupying positions on the walls are best spur-pruned, removing all forthright shoots, and training the plants as double or treble cordons, retaining the leading shoots so far as they have room to extend. Black Currants may

to a bud showing green, and the tangle of last year's growth removed. *Vitis Coignetiae* should be spur-pruned when it has covered its allotted space in order to keep it within bounds.

**Seed-Sowing.**—The main batch of Tomatoes is best raised from seeds sown towards the end of this month, and plants raised from earlier sowings should be kept growing freely by potting them on as required. Celery for early supplies should be sown now and the seeds germinated in a moderate temperature. Where plenty of heat is available a few seeds of Cucumbers may be sown, and an early sowing of Melons may be made, but where sufficiently high temperatures are not available, the sowing of the two last-named had better be deferred for a few weeks. Many kinds of half-hardy annuals, such as *Nemesias*, *Nicotianas* and *Petunias*, may be sown in boxes under glass now; these may be raised in comparatively cool houses, where they will grow sturdily from the start. Many failures among half-hardy annuals may be traced to raising them in too much warmth, thereby enfeebling their constitutions.

## ALPINE GARDEN.

### ARENARIA LEDEBOURIANA.

THIS attractive little Sandwort makes a delightful foil to the handsome rosettes of the encrusted Saxifrages; and it is seen at its best on sunny ledges where its roots can travel in search of moisture. The starry, white flowers, which are borne gracefully on practically invisible branching stems a few inches high, are produced very freely in June and July. Seen at a distance, the inflorescence resembles a shimmering gossamer veil caught above the plant. This unusual effect adds considerably to the garden value of the *Arenaria* when it is planted in such a manner as to attract the eye from point to point, in the same way as the mossy kinds of Saxifrage are utilised earlier in the year.

*Arenaria Ledebouriana* grows well in a cool, gritty compost of crushed mortar, sand and chips, with a handful of loam and well-rotted leaf-mould added. It is amenable to the vagaries of the weather, but in very wet districts it is apt to "go off" in the third or fourth year. This can be obviated to a certain extent by dressing the roots with sifted leaf-mould and sand during fine periods, but in my experience it pays better to take cuttings and replant. The young growths strike readily in sand or in the open moraine, if kept moist. Old plants broken up and grown on as cuttings, will develop into strong flowering tufts by the following season.

During the winter, a piece of glass should be arranged over the plant to ward off excessive moisture. *Selwyn.*

## FLOWER GARDEN.

### BORDER CHRYSANTHEMUMS.

EARLY-FLOWERING *Chrysanthemums* are becoming increasingly popular each year, which is not surprising when it is considered how easily they may be cultivated, and how useful they are, not only for furnishing beds and borders, but also for furnishing supplies of cut blooms for market, as well as for private establishments. There are three distinct types in cultivation, viz., the Japanese, pompon and single, the Japanese being by far the largest and most popular class.

The ideal *Chrysanthemum* for bedding purposes should be of a fairly bushy, stiff habit, thus rendering the use of supporting stakes unnecessary. If required for supplying cut flowers, somewhat taller-growing varieties, with a looser habit, should be selected, as length of stem is important for floral arrangement. Certain varieties produce sprays of flowers that are best if not disbudded, while others need to be disbudded to obtain the best results.

The illustration in Fig. 78 shows a fine bed of Mrs. Jack Pearson and White Boy at Kew. The former variety is a very fine type of *Chrysanthemum* for market; its stiff sprays of warm chestnut-brown flowers are ideal for cutting. As a bedding variety its habit is somewhat too thin, but when mixed with White Boy, a variety with more ample foliage, it makes a very fine, large bed, and although both attain a height of two-and-a-half feet to three feet, they do not require staking, even when grown in an open situation.

Cuttings may be rooted during January, February and March. After the young plants are hardened they should be planted out in lines in the reserve garden: as a matter of expedience, I plant them out during March, and they succeed perfectly; but as a general rule April may be regarded as the best month for planting them out. Certain varieties break naturally without stopping, while other varieties may have to be stopped once or twice. The plants may be lifted from the nursery and transplanted, even when coming into flower, to refurnish beds of early-flowering plants that are over. When grown for market, some of the later-flowering varieties may be lifted and placed in cold houses, or protected with canvas screens in the open.

There are numerous varieties to choose from, and individual tastes differ so much that it is difficult to give a selection, but the colours should be bright and warm, such as various shades of yellow, crimson, bronze and brown, such colours being more effective during the dull days than the pink and purple shades. The following are a few good varieties in the Japanese section: Abercorn Beauty, Dick Barnes, Goacher's Crimson, Diana, Polly, Sanctity, Harry Thorpe, Normandie, Elstob Yellow, Nellie Thorpe, Miss G. K. Thorpe and Almirante. A few good pompons are Craig-millar, Flora, Little Bob, Mignon, Piercy's Seedling and St. Crouts. *J. Coult.*

### NEPETA MUSSINII.

THOUGH mostly used as an edging to the hardy flower border, this plant may be utilised as a bedding subject. A large bed on a lawn or in the flower garden massed with this plant looks, from a distance, like a mist of Lavender. I have employed it with good effect in large beds as a ground-work for large pillar and standard-trained plants of the pink Ivy-leaved Pelargonium Madame Crousse, interplanted with *Gladiolus Prince of Wales*, salmon rose-pink, and with a broad edging of *Viola Bullion*. The effect was very much admired.

*Nepeta Mussinii* is easily raised from cuttings or by division. Cuttings root readily in a cold frame in autumn and only require protection from rain and snow during the winter. If the beds are ready this *Nepeta* may be planted early in spring to become well established before the summer. *George Mackenzie, Cranmer Hall Gardens, Fakenham, Norfolk.*

### AQUILEGIAS.

Too much praise cannot be lavished on the *Columbines*, for they possess all that is graceful and beautiful amongst hardy perennials, as well as being most accommodating either in the herbaceous beds or borders, on the rockery, or when grown as pot plants in the cold greenhouse. They succeed in partial shade and may be planted in full sun, but in the drier places they need copious waterings during times of drought. Their dainty, spurred and delicately-coloured flowers, produced either solitary or in clusters on stout, wiry stems, appear from May to August.

The beautiful *Aquilegia alpina* has blue and white flowers; hybrids of *A. californica* have yellow sepals and petals tinged with orange, and reddish spurs; *A. canadensis*, the American *Columbine*, has cinnabar-red and yellow flowers; *A. chrysantha* is a golden-yellow species; *A. coerulea*, the Rocky Mountain *Columbine*, has very beautiful blue and white flowers as have also *A. glandulosa* and *A. Stuartii*; *A. Skinneri* has red and golden flowers, whilst *A. nivea grandiflora* is a charming snow-white *Columbine*. The plants may be increased by division or by seeds. They should be planted in a fairly light, rich, loamy soil. *W. L.*

## BULB GARDEN.

### IRIS WEDGWOOD.

NOTHING more pleasing than this new *Iris* could be imagined, and the granting of a First Class Certificate by the R.H.S. Floral Committee, on February 8, must have met with very general approval. When one compares this *Iris* with *I. tingitana*, which, nowadays, is so difficult to cultivate on account of yellow streak disease, *I. Wedgwood* appears as a boon and a blessing, for the pots of this *Iris* shown by Messrs. Lowe and Shawyer were perfect examples of culture, and the plants exhibited no trace of the disease. The stems were strong and perfectly upright, with no tendency to bend, as happens frequently with those of *I. tingitana*.

The flower itself reminds one of the very best of the Spanish *Iris*, though stronger than most. The colour, as the name implies, is *Wedgwood blue*; the fall, which is almost circular and about an inch-and-a-half in diameter, has a defined marking of bright yellow in the centre, merging by way of cream into the

blue. The standards are a darker blue, and these are strong enough to maintain their upright position even when the flower is past its best.

It is, I imagine, the finest addition in recent years to our winter- and spring-flowering plants for the greenhouse. *J. S. D.*

## INDOOR PLANTS.

### LANTANA.

THE dwarf, hybrid shrubby *Lantanas* may be treated as annuals. A batch of plants raised from seeds sown in heat early in the year will furnish a bright display in the greenhouse later in the season. So soon as the seedlings are large enough to handle they should be transferred to small pots filled with light, rich soil, and grown on in a warm greenhouse, potting them as required until they are in receptacles six inches in diameter. Pot firmly, and for the final potting use a strong compost.

As growth develops pinch the shoots occasionally to promote a bushy habit. The growth is firm and wiry, and staking is not required.

The brightly-coloured blooms, in shades of yellow, orange, pink, carmine and white, are borne in densely-packed, round heads. Frequently the flowers change colour, and differently coloured blooms are borne in the same truss.

*Lantanas* may be propagated from cuttings. By pinching out all lateral growths and restricting the plant to one stem, standards of any height may be obtained. When the height desired has been reached, pinch out the point of the growth allowing sufficient laterals at the apex to develop to form the head.

The winter treatment is the same as for *Fuchsias*; a cool temperature is best, and only sufficient water to prevent shrivelling of the wood should be afforded the roots. Before starting the plants into growth in the spring they should be pruned and repotted.

*Lantana Camara* is, perhaps, the strongest-growing species and, if planted out, will grow to a height of ten or twelve feet and cover a large area of the back wall in a plant corridor or cool greenhouse. *F.*

### MEDINILLA MAGNIFICA.

*MEDINILLA magnifica* is one of the most handsome of stove flowering plants. It is a vigorous grower, and when allowed sufficient room for development, makes a splendid specimen; a big plant in full bloom is indeed an object to command admiration. Plants of this description are, however, too large for the majority of private establishments, and are only to be seen in botanic gardens. Plants in six- or seven-inch pots flower well and are very useful for the decoration of the warm house.

Cuttings of the young shoots, taken off at a joint and inserted in sandy soil, root readily in a close propagating case. The weaker shoots strike root more readily than the very strong, vigorous growths.

During the growing season an abundant supply of water is necessary at the roots; under congenial conditions it is surprising what a large plant is obtainable in a comparatively small pot. In the winter less water is necessary, for at this season the plant requires a partial rest.

The coral-pink flowers are produced in spring in drooping panicles which may be up to one foot in length. Their effect is enhanced by the pink colour of the axils in which they are borne and also by the large, pink bracts. The inflorescences contrast pleasingly with the broad, glossy, leathery foliage, which has paler veins.

A compost which suits *Medinillas* consists of good fibrous loam, with a little peat and plenty of sharp sand. The addition of small pieces of charcoal is beneficial.

Ample drainage must be provided, and only small shifts should be given when potting is required. Plants that have filled their pots with roots may be fed liberally during the season of active growth. *T. H. Everett.*

# OVER 14,000 IN ACTIVE SERVICE

THE ATCO MOTOR MOWER IS PRODUCED  
BY THE MANUFACTURERS OF THE  
**ALFRED APPLEBY CYCLE CHAIN**  
THE BEST CYCLE CHAIN IN THE WORLD

Over 14,000 users have proved to their complete satisfaction that the ATCO Motor Mower reduces the cost of turf maintenance to a minimum, improves the condition of the turf and saves time and labour in mowing. The ATCO is the most popular Motor Mower in the world.

## Only 11, yet she easily pushes this 16" Mower

The following unsolicited letter speaks volumes for the easy efficiency of the Patented J.P. SUPER.

Bognor,  
THE MANAGER, Oct. 18th, 1926.  
J.P. Super Lawnmowers, Ltd.,  
Leicester.

Dear Sir,

I took the enclosed snap during the Summer and thought perhaps you would like it. My little girl, aged 11 years, very often helps me mow the lawn, the Mower being so light to handle. It's a 16" machine.

Yours sincerely,  
R. L. B.

**free.** Write to-day for fully Illustrated Booklet No. 69.

Order one from any Ironmonger or Seedsman subject to test on your own lawn. You will be quite sure then that you have the best.

**J.P. SUPER LAWNMOWERS, LTD.,**  
69, Meynell Road, Leicester.

Our Patented Power Mower is built to the J.P. Super standard—and so it is most economical in use. It does not go wrong. Ask for full particulars.

## FLORISTS' FLOWERS.

### BORDER CARNATIONS.

It will be advisable to examine the plants and make any that are loose at the roots firm in the ground, also to stir the surface soil so soon as possible, but soil conditions have to be considered in this respect, for when the ground is heavy and rather retentive, treading the plants is apt to defeat its own object. Soil on the heavy side certainly suits many Carnations, notably Sells, provided they are not the yellow shades which, together with the yellow ground and Fancies, prefer, as a general rule, soil which is lighter.

There is still time for those who prefer spring planting to add to their collection, as March is the best month to do so, and among many good things, all the latest white ground Fancies are excellent. Mrs. James Fairlie, marked and flecked slate-grey, and Mrs. F. W. Seymour, with markings of carmine-rose, are two most beautiful flowers, the latter having gained both a First Class Certificate and an Award of Merit. Lady Bowen, a greatly improved Mrs. G. D. Murray, named after the Lady Mayoress who kindly opened a Carnation show at Carpenters' Hall, and Woodpark, both awarded a F.C.C. in 1925, are worthy companions, the last-named being perfectly shaped and lightly marked with pale rose. It is said to be so strong of stem that support of any kind is unnecessary.

Of yellow grounds the outstanding varieties are Duke Ivor, rich yellow, heavily marked with carmine-crimson, a beautiful and perfectly-shaped flower of strong habit; Ben More, a dainty, finely-formed bloom, the petals edged with clear rose-pink, which I greatly admired; and Hadrian, buff, suffused scarlet, with deep crimson stripes.

The Sells include the pure white Mrs. H. Swan, which should be found suitable for market purposes, as though not quite up to exhibition form, it is strong, floriferous and excellent for all decorative purposes; while a good deep rose-pink sort named Asphodel will please all who like that colour.

The Fancies, pure and simple, have become very popular with growers, and many new varieties of these fascinating Carnations have lately been sent out. The following sterling novelties will be grown by all in search of fresh colour schemes. Ebor, a flower of that perfect form I have often noticed goes with that combination of colours or near it, light chocolate, striped scarlet and dark maroon (an example of this being The Cadi, a variety brought out three or four seasons ago, whose every bloom is shapely); Ida Gray is an ideal flower of salmon-pink marked with silver-grey; Old Smoky is a decided break in colour, the raisers' description being dusky apricot, sparsely banded with dark carmine. It remains to be seen if this will prove a favourite, but I think any departure in colour combination should be welcomed, provided the plant is strong and the flower well-shaped. Lastly, there is Julia B. Wells, at present, I believe, unique in its beautiful slate-grey ground, striped plum-blue, with a delicate pinkish sheen on the petals. This is a large flower of the strongest border habit, and I specially recommend it for that purpose.

As many amateurs do not understand what a Fancy is, I may state that the name is now adopted by the National Carnation and Picotee Society in place of the word "Nondescript," formerly used to denote any combinations of colour other than yellow or white ground Fancies. A Fancy may be of any two or more colours, provided they are not yellow or white. Besides the novelties mentioned, there are Sam Griffiths, which appeared last year, a good doer, very shapely, and beautifully marked light cerise on mauve; Myrtle, Pettigrew a lovely flower of telling old rose colour, banded with scarlet; Cleopatra, rose madder, speckled with scarlet; Verdun, chocolate, striped maroon; the two last well-tried favourites being of good form and substance, and fit for any purpose, while Doris Trayler, with bright scarlet ground and dark maroon marking is also, like Mrs. A. Brotherstone, Clove-scented.

With one exception, I planted all the novelties

I have mentioned in the open border last autumn, and they have all passed through the winter unharmed by cold, and are commencing to grow.

Sells of recent introduction which are proving of sterling merit are Joan Wardale, deep crimson, which shares honours with that good old variety Gordon Douglas; Bookham Scarlet, splendidly strong and well-shaped, a grand variety for exhibition; Coral Clove, with its changing tints, and heavy perfume; Bookham Sunshine, an excellent open border yellow; Delicosa, lovely lilac rose and well proportioned; Benedict, deep rose-pink, large, and of great substance; Nautilus, soft salmon-rose, an acquisition for the border; Rhoderick Dhu, a glowing wine-

A flower which has never been surpassed is Sweet Anne Page (Fig. 79). I know it is difficult to layer, but it is so lovely, it should be included, if possible, in all collections.

Of white grounds, Ravenswood, with its heavy maroon markings; John Stobart, barred soft rose; Mrs. E. Charrington, a well-known variety; Prospero, marked rosy scarlet, one of the best; and Flora McIvor, a dainty flower striped cherry-rose, are amongst the latest additions, strong and suitable for border or pot cultivation, but I have not found one to take the place of Fair Ellen in my affections. This is, indeed, a noble variety.

The Clove section has The Royal Clove added to it this season; the flowers are large and of

FIG. 79.—CARNATION SWEET ANNE PAGE.

crimson, suitable for any purpose; and Bindle, a very strong, grey-heliotrope. Two fine varieties exhibited at Carpenters' Hall last season were Cockatoo, rose, and Shirley Surprise, maroon; the former is a delightful flower, and should be more generally known.

Yellow ground Fancies are enriched by the following new sorts: Mrs. J. L. Gibson, that beautiful Kelso-like flower, an early bloomer which I find particularly lasting; Viceroy, a grand flower perfectly shaped, grows well anywhere; Clio, quite distinct, with its one wedge of scarlet on each petal; Dr. Connor, softly suffused with pink and striped red; Highland Mary, exquisite in every respect; Hotspur, perfect in the border, striped and suffused pink, rose and yellow; Dr. Stone, a very bright flower with brilliant rose markings; and Sheila Gibson, the heavy lavender shading flecked with pink and carmine being charming.

a fine cardinal pink shade. As exhibited it was very lovely and should be an acquisition to the open border. Older varieties which stand out are Steerforth, Rose Clove, Crystal Clove, Margaret Keep, Salmon Clove and Spicy Breeze. J. B. Wells.

### NEW CARNATIONS.

THE following varieties of Perpetual-flowering Carnations have been registered with The British Carnation Society: Wivelsfield Copper, copper-bronze, blended with orange; Velvet, light mauve, shaded with crimson; Splendour, bright salmon-red. These three were raised and sent by Messrs. Allwood Bros., Wivelsfield Nurseries, Haywards Heath. Happidais, a bizarre coloured variety; Margot Holmes, mauve. These two were raised and sent by Messrs. Stuart Low and Co., Bush Hill Park, Middlesex.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and advertisements should be addressed to the PUBLISHER and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

## MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA\*

### VII.—THE LOWER SEINGHKU VALLEY.

I WAS up at 4.30 a.m. on May 16, anxious to see what sort of a country I had reached. The valley opened out a little here, two considerable streams entering the Seinghku, one from either side; and through one of the rents lofty peaks appeared in the background, their summits hoary with snow, which shone dully behind a veil of mist. The river rushed clamorously through a gut choked with sub-tropical forest, every tree of which was inundated with striving plants, especially Orchids, Ericaceae (Rhododendron, Agapetes), Melastomaceae, Ferns, Zingiberaceae and Aeschynanthus. Then came a few poor clearings, little oases snatched from the hungry ocean of forest, which closed in again, and gradually became more temperate in character. It is important to remember, however, that in every direction the mountains were hidden under a dense covert of more or less evergreen, broad-leaved trees, since that one fact gives the key to the climate—rain at all seasons.

The river was spanned by a sagging Cane bridge (Fig. 83) even more frightful than the one at the confluence, though not so long.

During the ascent of the Seinghku valley, I saw masses of Rhododendron dendricola, which became more and more abundant and now, at an altitude of 5,000 to 6,000 feet was in full bloom. A little further up the valley, and on the ridges not far above our camp, grew R. Mackenzianum, with an occasional specimen of R. Nuttallii not yet in bloom; and still higher I met with a solitary "Grande" species, evidently youthful, for it had flowered the previous year and exhausted its strength.

Thus far then, there was no change in the Rhododendron flora, the typical Burmese, sub-tropical forest species holding the field. Other trees and shrubs noticed were: A species of Ficus with handsome, polished leaves, Alnus, Decaisnea (in flower), Acacia, Populus, Quercus (several species including Q. lamellosa), Acer, Euonymus, Ailanthus; also many big Araliaceae, climbing Palms, an immense-leaved Musa, bushy Ericaceae (Vaccinium, etc.), and climbing plants like Akebia, Schizandra (bright yellow flowers), and Tripterygium. There were numerous species of Rubus growing in the open meadow, and in old clearings, one in particular

bearing masses of yellow fruits quite pleasant to eat. After a hot climb, I indulged freely in this dessert, mixed with goat's milk, and found the ripe fruit most refreshing.

FIG. 80.—IN THE TRACK OF THE FAMINE.

New Nung graves, and secondary growth.

One day I climbed a bold spur which evidently reproduced at quite a low altitude, the conditions of loftier regions. From the start, Rhododendron Mackenzianum was common, and where other trees flourished they had to support

FIG. 81.—RHODODENDRON DENDRICOLA.

puffy white clouds of R. dendricola (Fig. 81). A little higher up came the first 'Vaccinioides' Rhododendron in bloom. This was a small, epiphytic undershrub, rather loose and leggy in habit, but remarkable for its bright orange

flowers, ringed with brick-red anthers, which peeped out from amongst the tense green, spoon-shaped leaves. These leaves are rather large, larger than in any other 'Vaccinioides' species known to me, fat and polished; while young shoots were breaking into puce-coloured plumes, and the ground beneath was starred with fallen corollas. The species (K.W. 6735) is at any rate not the Himalayan R. vaccinioides. It is the best of three species of the section found by me, but dainty though it undoubtedly is, I am reluctantly compelled to admit that the 'Vaccinioides' Rhododendrons have no garden value—even apart from the fact that they are not hardy. Botanically, however, they occupy an unique position in the genus.

On a cliff, raked by the winds from either flank, I found quite a colony of Rhododendrons, including R. Maddenii, and a small tree 'Neriiflorum,' with long, narrow leaves, glaucous, with wax beneath, and bristly petioles. R. Maddenii, formed fairly stout, compact bushes, but was not in flower; and on the glassy-stemmed 'Neriiflorum' which defied gravity, plus or minus, and grew almost horizontally out from the cliff, I could discover neither fruit nor flower buds. Another interesting epiphyte was found here. The small crinkly, woolly-bearing leaves pointed to R. Edgworthii, but K.W. 6793 is not that plant, though allied; it has neither the flowing, draping habit, nor the large, white flowers of R. Edgworthii. Here it was a rather angular, clumsy-looking shrublet, though that may have been because the specimens were not happy. The flowers are not so large as those of R. Edgworthii, of a bright canary-yellow, with red-brown anthers. If hardy—and it grows as high up as 9,000 feet—it has the makings of a rock plant.

Orchids abounded, growing on rocks and trees down the backbone of the ridge; and on the face a pretty Calanthe was coming into flower.

Six days we stayed here in camp, not idle, but impatient. The local man power was strained to the utmost, providing three coolies, so we had to look to the Tibetan colony up the valley, or to the Tarons of the Adung, for help. Meanwhile, the Tibetan headman had come down to see me, and after a friendly chat had betaken himself back to issue orders for the building of a log hut at his village, where I proposed to establish my base camp. When the hut was finished, he sent down a dozen men to escort me, and so, at last, on May 22, we were able to advance once more. Most of the loads, of course, had to be left behind in charge of the Chokara, who was sick; and these were gradually moved up as vagrant coolies turned up from the Adung.

The next stage up the Seinghku valley resolved itself into two parts: (1) Along the river bank, higher or lower, in forest, for a few miles; (2) up a steep ridge, back from the river, with an abrupt descent again to permanent meadow and cultivation (Fig. 82) at the village, with a net ascent of about 1,000 feet.

Now the flora began to grow more interesting. On the river bank grew a fine, red-barked Birch, and a dark-leaved Illicium, studded with pale, moth-like flowers. Better still, the narrow ridge, which was cut away on either side and plunged headlong down to gnashing streams, was almost entirely colonised by Rhododendrons; thus proving the need, even here, of a slightly xerophytic flora. I might add that the genus is extremely sensitive to even so small a change as this, and being extraordinarily aggressive in its homeland, is at once prepared to occupy positions of which other trees are a trifle shy. The knife-edge ridge was in fact clothed with a species of 'Irroratum' Rhododendron, which, however, though well-grown, had not flowered the previous year, and had no intention of doing so this. It was only after a prolonged search in October that I found one tree out of many dozens examined, which carried a few current capsules; so what the flowers are like I cannot say.

The epiphytic Rhododendron flora included all the species already described together with another 'Vaccinioides' species to be described later; R. dendricola was still flowering bravely.

It is a curious and not unimportant detail of the plant collector's experience to remember that, when ascending a steep, wooded mountain

\* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, 1927.

Supplement to the GARDENERS' CHRONICLE.

CUPRESSUS TORULOSA AT STANAGE PARK, RADNORSHIRE.

path, he is more prone to notice plants low down, and when descending, to notice the tree tops. Thus it was that, on this occasion, I failed to notice a remarkable tree which, when passing this way in August, I immediately singled out.

new hut on the river bank. In the meadow, a bushy *Viburnum* with chalk-white flowers, was abundant, and a large, floppy *Rose* sprawled about in thickets of *Bamboo*, *Barberry*, *Euonymus*, etc. To these may be added species of

## NOTES FROM WISLEY.

DURING the winter months the gardener is thankful that the majority of injurious insects are resting, and that comparatively little damage is actually being done by them. His mind is not so easy, however, with regard to birds and animals, many of which are extremely active. The grey squirrels are a constant source of trouble, and during the last fortnight most of the top branches of a *Cupressus Lawsoniana* in the Wisley wild garden have been cut off as neatly as with a knife by the sharp teeth of a pair of these creatures. The prunings have been laid in a heap at the foot of a neighbouring blue Cedar in which it seems likely that a nest is to be built. Birds are also giving trouble by mischievously pecking off the flower buds from trees such as *Prunus Pissardii* and by removing the berries from shrubs such as *Berberis* and *Cotoneasters*, most of which have now completely lost their fruits. An exception is *Cotoneaster rotundifolia*, whose round, sealing-wax-red fruits still persist in large numbers.

Many of the *Berberis* and *Cotoneasters* which have lost their berries are still ornamental on account of their evergreen foliage. Among the most useful in this respect are *Berberis Sargentiana*, with dark green, glossy leaves; *Cotoneaster serotina* and *Cotoneaster microphylla*, the leaves of which are now tinged with purple, while among other evergreens which stand out are *Osmanthus Delavayi* and *Lonicera pileata*, with particularly fresh, green foliage. The flowers of the *Witch Hazels* are now past their best, but the little yellow blooms of the *Cornelian Cherry* (*Cornus Mas*), which is as yet leafless, are just showing.

The Heath Garden is now very bright, chiefly owing to the flowering of various forms of *Erica carnea*. One of the earliest and best is *Erica carnea* King George which, in company with *E. c. Queen Mary*, has been in bloom since the beginning of December. Some of the deeper

FIG. 82.—CULTIVATION IN THE JUNGLE.

It was a *Rhododendron*, with large, somewhat drooping leaves, and fine, big trusses of fruits, tawny in colour. Naturally, I took it for a 'Grande,' and it was not till October, when I made a special pilgrimage to the ridge for seeds, I made the astonishing discovery that it was really an 'Irroratum.' There was only the one solitary tree, some forty feet high, with a smooth, fairly erect trunk, branching out thickly at the summit; and it grew on the ridge in the very midst of the 'Irroratum' belt. The largest leaves I collected were a foot long and six inches wide, but apart from their size, they were of the typical 'Irroratum' type; the same cannot, perhaps, be said of the fruits, which are closely furred with rust-red, bristly hairs. The truss is very large and open—at least, in fruit—carrying fifteen or twenty flowers; and since the 'Irroratums' are all scarlet, this big-leaved tree in full bloom must be a gorgeous explosion of blazing fire.

On the ridge, too, was a single example of one of the most striking Maples I have ever seen. It was quite a small tree, dwarfed possibly, and in full fruit, hung all over with scores and scores of bright red tassels. In this respect it resembled *A. Henryi*, but the tails in my plant are longer and the small fruits with widespread wings cuddle more closely than in *A. Henryi*. In foliage the two species are sharply contrasted, for my plant has simple, entire leaves, with a long drip-tip. Five months later, the tails, now a little longer and a little fatter, though they had lost their chubby freshness, still hung motionless and intact, beautifully draping the foliage. There are several species of *Acer* in the valley, but nothing so good as this one.

*Pinus longifolia*, a giant tree with long, glaucous needles and big pendant cones also descended to the flanks of the ridge; but its true home is a thousand feet higher up.

The trees and rocks on the ridge, in contrast with those in the dim depths of the jungle, were smothered with a snaky growth of epiphytic Orchids, of which one species, a white-flowered *Vanda*, was in bloom high up. When I returned here in October, I collected half-a-dozen species in flower, some of them very quaint.

After a considerable ascent, I traversed the face of the mountain in thick forest, till, suddenly I emerged on to a wide-open terrace, partly cultivated, but mainly under grass and Bracken. There were a few small, wooden huts here.

Descending the steep flank of the terrace, I quickly reached the river once more, and, passing through a belt of trees, found my

*Clematis*, *Honeysuckle*, and other climbing plants. The valley opened out a little, and there was a little permanent meadow land where cattle grazed; but the mountains were precipitous, and thickly forested to their summits. A few houses were threaded on the strip of cultivation at the bottom of the valley, and the

FIG. 83.—CANE BRIDGE OVER THE SEINGHKU RIVER.

boisterous river was spanned by a small wooden bridge. Up the valley I could see nothing but more mountains and more forest; but snow was visible on the loftiest ridge, visible through a gap opposite my camp, whenever the cloud thinned a little.

So I began to settle into my hut and take stock of the situation. *F. Kingdon Ward*.

coloured varieties are now commencing to bloom, of which *Erica carnea Vivellii* is one of the most distinct. In addition to these and other good varieties of this species, such as *Pink Beauty* and *Queen of Spain*, *Erica darleyensis* is making a bold display, and plants of *Erica mediterranea alba*, although still in bud, are not unattractive at this stage.

The long border which flanks the Paeony beds has now been planted with a comprehensive collection of long-spurred Aquilegias, in front of which about sixty different varieties of Crocus are coming up. *Gentiana acaulis* has for many years formed an effective edging to this border. A few blooms are now visible, but the majority have been considerably damaged by sparrows and by frost.

The Narcissi in the wild garden are much later in flowering this year than last. Nevertheless, a few *Narcissus cyclamineus* are now in flower and look particularly well where they have come up among the red leaves of *Schizocodon soldanelloides*. *Narcissus cyclamineus* has only just come into bloom in the alpine house, where it is flowering with many other yellow-flowered subjects, such as *Narcissus bulbocodium*, *Draba armata* and *Morisia hypogaea*.

A feature of this house at the present time is the large number and variety of *Kabschia* hybrid Saxifrages. A particularly striking one is *Saxifraga* × *Jenkinsii*, with large and shapely flowers of pale pink, while the very grey-foliaged *S. Sundermanii*, *S. lilacina* and *S. Elysium*, with deep rose blooms, are also very charming. Pretty yellow-flowered Saxifrages in flower include *S. Franzii* and *S. juniperifolia* var. *macedonica*. Among the *Primulas* in the alpine house, *Primula megaseaeifolia* is now at its best, and *P. Allionii*, a native of the maritime Alps is also in bloom. The scape of this tiny *Primula* is almost absent, and the pink flowers rest upon a sticky rosette of leaves.

In the alpine frames several *Crocus* species, such as *C. Korolkowii*, with yellow flowers, and *C. laevigatus* with striped mauve flowers, are in bloom.

Snowflakes and Snowdrops are now flowering in large numbers in the wild garden and in the border in front of the laboratory a giant Snowdrop, *Galanthus latifolius*, is in bloom. Here also may be seen *Galanthus nivalis viridapice*, the perianth of which bears broad, green markings *J. E. Grant White*.

## TREES AND SHRUBS.

### CUPRESSUS TORULOSA.

#### THE HIMALAYAN OR TWISTED CYPRESS.

THE Supplementary Plate accompanying this issue is reproduced from a photograph taken by Mr. Heyworth Knighton, and represents a specimen of *Cupressus torulosa* growing at Stanage Park, Radnorshire.

To give the tree its full title—if anyone would wish to indulge in a little pomposity—I should have to describe it as a qualified member of the section of *Cupressus* called *Eu-Cupressus*, which is, in turn, a sub-division of a sub-tribe called *Thuinae*, of the tribe *Cupressineae*. This is the sort of meticulous and detailed description that would only be insisted upon for a continental traveller in a disturbed country to exhibit upon his passport. It will be quite sufficient, for most of us, to regard the species as a graceful Cypress, very much like, *prima facie*, several other Cupresses, to wit, *C. macrocarpa* (Monterey Cypress), *C. sempervirens* (the Roman Cypress), in their fastigate form, and also like the Californian *C. Goveniana* (Gowen's Cypress), and the more newly arrived species from China, *C. Duclouxiana*. But on closer inspection it can be shown that they all have their little differences and habits, some of which may be explained before the conclusion of this article.

The tree depicted, in spite of the fact that it is described generally as tender, except in the more warmly favoured parts of England, has grown at an elevation of nearly 800 feet above sea-level. According to old documents, it was planted in December, 1842, and referred to, on their pages, as *C. tomentosa*, *torulosa*. In 1926, it measured forty-seven feet high, and seven feet four inches in girth, and though, not aspiring to championship honours, would, we were told by the authors, had they paid it and us a visit earlier in these days of quest and volume making, have been given a niche

in that Walhalla of remarkable British-grown trees, by H. Elwes and Prof. Augustine Henry, in their book entitled *The Trees of Great Britain*.

A tree growing at Killerton, Devon, measuring sixty-five feet high and five feet four inches in girth, appears to be the largest tree of the group mentioned by the authors of this book. At Hewell Grange, mention is made of another—the leader of a quartet—that measured in 1909, fifty-six feet high and three feet eleven inches in girth. Lord Plymouth has kindly had the tree re-measured for me; it is now sixty-three feet high and four feet eight inches in girth—a height growth of seven feet in seventeen years, and an exogenous growth of nine inches in the same time; a growth approximately of less than six inches per annum in height and half-an-inch in girth.

Again, not very far from here, there is a good specimen at Eastnor Castle (Lord Somers'), and also one at Penhryn Castle, both of which places are noted for their trees, planted by tree-loving ancestors in the earlier quarter and half of the last century. There are other good specimens reported as flourishing in the milder climate of Devon.

In the *Trees of Great Britain* appears an illustration of an avenue of *Cupressus torulosa* growing at Cuffnells, New Forest, the residence of my late old friend and contemporary, Mr. Reginald Hargreaves. When I saw them, I recall that these trees gave me the impression of being rather taller and more slenderly built than our single specimen. This impression was confirmed when I found that they measured, at the time of Elwes' visit, some forty-five feet high and four-and-a-half feet in girth.

According to Loudon, *C. torulosa* was introduced in 1824, and discovered by Buchanan-Hamilton in 1802. The seeds from which our tree sprang were brought home from India by a friend of the family, in company with seeds of *Abies Webbiana*, *Picea Gerardiana*, *Picea excelsa* and *Cedrus Deodara*. Of the two last-named, plenty are in evidence to-day, but the two former have left not "a wrack behind." Yet, ever hopeful, over their ashes, I have—metaphorically speaking—raised the banner and device "Resurgens," and given them an opportunity of redeeming their questionable and disappointing past.

In helping on the process of identification of these *prima facie* similarities, referred to above, a clue may be found forthcoming in a name bestowed, presumably in reference to the presence of glands on the leaves, a microscopic individuality not held in common with the similarities mentioned, *C. macrocarpa* and *C. sempervirens*. *Torulosa* is the diminutive of the Latin word *torus*, which in its first sense signifies a protuberance. From thence it comes to be applied to many and various uses, architecturally to a moulding, domestically to a bed, pugilistically to the muscles of brawny arms, and more personally to a system of hairdressing, as a tuft of hair. *Torulosa* would, for instance, describe the fuzzy-topped head gear of a short-cropped Australian aboriginal, and would equally apply to the bobbed coiffure of a fashionable damsel of the world to-day.

I have attempted in my *Characteristics of Conifers*, as simplified a method as I could devise of identifying this and other Cupresses. From its pages I will only essay a short summary here, confining it to some differences that exist between *C. torulosa*, *C. sempervirens* and *C. macrocarpa*. I will not attempt to drag into the arena of discussion the more uncommon *C. Goveniana*, of California, nor the lately-arrived *C. Duclouxiana* from Yunnan. First, be it noted, it is the presence of glands upon the leaves which distinguishes *C. torulosa* from its similar congeners. To examine into these, I own, suggests a magnifying glass inspection, and that is a microscopic process, unbeloved, unpursued and unemployed by the generality of amateurs, who like to learn their lesson, on the more dashing principle of "A sight should suffice." Secondly, there are to be reckoned with, and learnt from, the cones or strobiles—their shapes, sizes and habits. The cones of *C. sempervirens* ripen the first year, and vary in size. The cones of *C. macrocarpa* ripen in the second year and do not vary in

size; they are much larger than those of the *C. torulosa*, which also ripen the second year.

And now I come to the branchlet systems of this tree of trees. If one takes a spray of either *C. macrocarpa* or *C. sempervirens* and lays it on the table, it will be noticed that it cannot lie so flat, as, for instance, a sprig of Fern, for the reason that the branchlets, of which it is composed, grow indiscriminately and radially round the main branches, whereas a spray of *C. torulosa*, with branchlets arranged in one plane, should lie flat. Sometimes it deviates a little from the strict path of rectitude, but is sufficiently orthodox to show a distinction from the other two.

Fourthly, there are the differences in shape and outline of these three Cupresses, in their sub-fastigate forms. While the shape of *C. macrocarpa* and *C. sempervirens* may be described as columnar or even clump-headed, *C. torulosa* affects a soaring peak or flame-shaped top. Anyone then observing a Cypress tree of this shape looming against the sky-line should awaken to the fact, and announce—if he wishes to make an impression—that here is a tree of rarer appearance than *C. macrocarpa* or *C. sempervirens*, and one, in my humble opinion, of a more picturesque outline. *Chas. Colman Rogers, Stanage Park, Radnorshire.*

### ESCALLONIA RUBRA PYGMAEA

SIR FREDERICK MOORE, late of Glasnevin Botanic Garden, saw our plants of this *Escallonia* last summer and informed me that this very pretty little rock shrub originated from a so-called Witch Broom found on an ordinary *Escallonia rubra*. Cuttings taken from this congested growth retained the dwarf, close-growing habit, and resulted in this dwarf variety. At times this pygmy form produces a shoot or two which reverts to the free-growing type. These should be cut out so soon as they are noticed, for we find that if they are left it is only a question of time before the whole plant reverts to the type. I have noticed similar instances in that useful little rock-Conifer, *Juniperus communis compressa*, *J. hibernica compressa* of gardens, which proves the origin of these dwarf forms. I freely endorse the praise *J.* (p. 96), bestows on the pygmy *Escallonia*; its long flowering season will make it popular when the plant is better known. *W. E. Th. Inghersen.*

## RAISING NEW DAFFODILS.

I FEEL that I must write a few words in reply to Mr. Longford's letter in *The Gardeners' Chronicle* of February 5. I would state that the credit for raising *Narcissus Owen* is due to the late Mrs. R. O. Backhouse, on whose lawn at Sutton Court I first saw it growing. I am afraid Mr. Longford's letter may discourage some would-be Daffodil enthusiasts, and for this reason I am writing these few lines. The Royal Horticultural Society's little *Classified List of Daffodil Names*, besides containing the names of a great number of existing Daffodils also contains an "obituary notice" of a considerable number which have, for all useful purposes, passed out of existence, and the new Classification List will, no doubt, contain many additions to both lists. Only a very small percentage of named Daffodils become commercial varieties, and out of the many new sorts appearing each season, only a few survive. It is difficult for a collector to pick out the best. Personally, I like to see a variety growing and if I am attracted by the flower at close range I step back, say, ten yards or so and if I am then satisfied with its general deportment. I make my decision in its favour. But this method is not always possible, and the collector has to use his judgment when he sees a new flower at a show, or perhaps a description of it in a trade catalogue, and we all know that catalogues are inclined to deal in superlatives. He may confine himself to varieties which have received awards, or take the advice of a friend who can make the selections for him, but in such case, he will not derive the keen satisfaction

# A WALK THAT ONCE WAS WORK

Cutting the Lawn is now a walk round with the "Governor"—quicker, easier and much more satisfactory than it has ever been before.

£40

The 17-inch 'Governor' (Air-Cooled)

The 1927 "Governor" possesses many unique features that make it easily the finest machine on the market.

Built with all the mechanical accuracy and precision of an aircraft engine, but without its complicated controls, the "Governor" Motor Mower is simplicity itself. It is absolutely fool-proof and will stand any amount of hard wear without showing signs of long use.

## TEST THE "GOVERNOR" FIRST **GOVERNOR** MOTOR LAWN MOWER

which none surpasses

The only 22-inch Water-Cooled Motor Mower in the World **£50**

### A FEW OPINIONS.

"The 'Governor' is much nearer to perfection than any Motor Mower we have seen, owing to its comparative lightness."

H. ABERCROMBY,  
Addington Golf Club, Croydon.

"The 'Governor' has given great satisfaction. Its sturdy construction enables an enormous amount of work without mechanical trouble."

SECRETARY,  
Stanmore Golf Club.

"The 'Governor' is excellent in every way, no trouble and very economical. Work that took a man and a lad eight hours is done with the 'Governor' in 2½ hours"  
—(Extracted.)

"The 'Governor' is a great success. My man does in five or six hours what used to take over two days to do."

ROBERT CAMPBELL,  
Wimbledon Common.

"I consider the 'Governor' a very sound engineering job."

ALAN STURDY,  
Carey, Wareham, Dorset.

"Several gardening friends agree it does all you claim for it."  
—(Extracted.)

"The 'Governor' cuts 10 greens to the gallon, averaging 500 square yards to the green, which is about 1½d. per green. It is very quick in its work and rolls and cuts at the same time, the weight of the machine being just right for rolling."

S. TRAPP,  
Oxley Park Golf Club, Wolverhampton.

## A CLEVER INVENTION FOR RAISING WELL WATER

The Boulton Water Elevator lifts a  
continuous stream of water  
from wells of any depth. No pipes  
no valves or suckers, cannot  
freeze. Can be fixed within an  
hour without skilled labour.  
Thousands in daily use.Write for Catalogue No. 756.  
Boulton & Paul, Ltd. Norwich.

DOBBIE &amp; CO. LTD.

Kings Seedsmen—EDINBURGH.

from his collection that he would have made his own selections. However carefully the selection be made, it must be always borne in mind that the best varieties of to-day will be losing their places as years go by.

When I commenced to raise Daffodils twenty-eight years ago, I might have regarded success as well-nigh impossible after seeing Mr. Engleheart's productions of that time, but it does not do to be scared at the start, and I owe a great deal to the kindly advice and encouragement freely given by such dear old friends as the late Mr. Peter Barr, Mr. W. Baylor Hartland, Rev. G. P. Haydon and Mr. Robert Sydenham, all keen enthusiasts in their day. Each season I bought what I considered likely varieties for my purpose, limiting myself to £5 for a single bulb, and I well remember giving most serious consideration to raising my limit when Will Scarlett stood at £20 a bulb, and I have often regretted that I passed it by. I began to work with some sixty commercial varieties of the time, and amongst the many crosses I made, it was in my second season that I hit upon a lucky one; I crossed Sir Watkin with pollen taken from some forced blooms of poeticus ornatus; this gave me a batch of useful early varieties of the Incomparabilis type, some self-yellow and many with a suffusion of orange in the cup, all robust and free-flowering; it is twenty-two years since they first flowered, but now their stocks run into thousands.

A seedling has a long journey before it reaches the goal of public favour; prizes and awards help it along to some extent, but it has to gain the confidence of the gardening fraternity before it is really established. I think the awards that the R.H.S. gives to varieties that have passed successfully through the three years' trial at Wisley will be very valuable. I do not think the public object to long lists of names, and at Daffodil shows it is highly desirable that all flowers should be named if only to enable those who have seen them to talk about them, and I would like to see far more young and enthusiastic exhibitors, especially in the seedling classes. It is only from a vast number of seedlings that we can hope to get what is really wanted. A beginner need not be discouraged by the wonderful modern flowers; I thought the limit of progress more nearly reached twenty-five years ago than it is now. In 1914 I dropped out of the running, and when I recommenced after the war, I found I had lost a great deal of ground, but now I have once more my annual batches of seedlings flowering and am as keen or keener than ever, being convinced that with the material now at my command there are greater possibilities than ever before. If the beginner does not care to spend much money on the newer varieties let him work on the older ones; let him try Maximus for early yellow trumpets. I am still using this fine old variety as a seed parent with confidence. Then there is the old Barrii Beacon; I am sure this is still capable of producing many fine things; my double Llinos was a seedling from Beacon crossed with the pollen of the old double N. Telamonius plenus; Princess Mary and Minnie Hume have each proved themselves very good seeders. N. cyclamineus is a doubtful asset; I have raised seedlings and intercrossed them to the fourth generation, and they are very lovely and of a particularly clear luminous yellow throughout, but, so far, I have not one that has any constitution, although some flowers are the size of Emperor. With N. triandrus calathinus I have had no success, but on the other hand I have a number of nice stocks from the pollen of N. triandrus albus, and the best of these are from the seed of the yellow trumpet P. R. Barr. These are a few ideas by way of encouragement to the beginner, and I would especially emphasize the importance of an imaginative mind. To sit by the fire of a winter's evening and raise new Daffodils of peerless beauty is a delightful pastime; to work for these ideals when the spring comes; to live in a dreamland of expectation for four years until the first bud appears on the first bed of seedlings; to watch it expand and even though it be not after all a real swan in perfect plumage, is a pleasure. Some day a flower will appear and justify all the care given to the work. W. A. Watts, St. Asaph.

## NOTICES OF BOOKS.

### Sanders' Orchid Guide.

A LARGE amount of research, a wide experience of Orchids and their cultivation, and much loving care, have contributed to the production of the 1927 edition of *Sanders' Orchid Guide*.\* This edition is dedicated to the memory of the late Mr. H. F. C. Sander, by his three sons, who are the authors.

A well-worn former edition is always within easy reach of our editorial desk, and we are sure the new volume with its 450 pages, will be equally well used as a book of ready reference. *Sanders' Orchid Guide* deals only with species, well-marked varieties and natural hybrids, the garden-raised hybrids and varietal forms, whose names are legion, being dealt with in the separate and also useful work, the *List of Orchid Hybrids*. The descriptions are excellent and written in language readily understood by the most amateurish of amateur Orchid growers, and yet they are botanically correct. The different genera are described in alphabetical order, and in each genus the species are similarly treated. Synonyms of genera and of species are also given in their alphabetical sequence. The height of the plant, its time of flowering, colour, style of inflorescence and habitat are all indicated in the description, while the letters S. I. and C. indicate whether stove, intermediate or cool treatment is desirable.

General cultural advice is given at the beginning of the volume, while special details of management are indicated under each genus.

A charming foreword by Sir Frederick Moore follows the introduction, in which the authors pay a kindly tribute to the work of Mr. E. W. Cooper, an esteemed employee who helped in the compilation of the volume. Of particular interest are the notes on the cultivation of Orchids in such distant and widely-separated countries as Ceylon, South Australia, Japan (by Viscount Ijuin) and Trinidad, while very practical advice is also given concerning Syringing and Spraying; Hybrids and Seed Raising; Imported Orchids, and Orchid Diseases.

The book is thoroughly well-printed in clear type. There are wide margins to all the pages and the whole of the subject matter may be read with ease. A serviceable binding is provided; the outside measurement of the volume is eight inches wide by ten-and-three-quarters inches deep, while its thickness, practically one-and-a-quarter inch, gives some idea of the immense amount of work entailed in its production.

### Vegetables for Home and Exhibition.†

THE maintenance of an ample and varied supply of vegetables is a matter of paramount importance in most gardens, and not a few gardeners have come to grief because of their failure to meet the demands of their employers—not always the gardeners' fault, by the way—notwithstanding their skill in flower gardening, as plantsmen and as fruit growers. Although the kitchen garden is too frequently the last place to which a garden owner will take his visitors, it is by the quality and amount of food supplied by this department that the gardener is ultimately judged. The "Glory of the Garden" calls forth admiration, but Carnations and Chrysanthemums, Roses and Rhododendrons, stately trees, wide-spread grass, flower-flecked pools, glowing herbaceous borders and interesting rock gardens, are all "too bright for Nature's daily food" and before and after the enjoyment of beauty we needs must come to the table.

Fortunately, the cultivation of vegetables and salads is not now regarded as one of the meaner occupations of the gardener, and it is due in no small measure to Mr. Edwin Beckett's enthusiasm that the kitchen garden and its produce occupy a higher position in the economy of the garden and in the great horticultural exhibitions of to-day, than they did half-a-century ago.

\**Sanders' Orchid Guide*, Revised (1927) Edition. Messrs. Sanders, St. Albans. Price 31/6, post free.

†*Vegetables for Home and Exhibition*, by E. Beckett-Simpkin, Marshall, Hamilton, Kent and Co., Ltd., 17, Ave Marie Lane, E.C. 4. Price 15s. net.

As our pages have shown, not every cultivator agrees with Mr. Beckett's method of cultivating the soil, especially for vegetable crops, but whether they agree or not, they have nothing but admiration for him, for in a very real sense he has "delivered the goods," and has done so over a very long period. The soil at Aldenham is naturally unkind, but by pursuing the methods he advocates, Mr. Beckett has compelled the uncongenial earth to yield her bountiful increase. The kitchen gardens, the orchards, the flower borders, the great beds of shrubs, and the fine young trees at Aldenham, all demonstrate the success of his methods.

As a cultivator, Mr. Beckett occupies an unique position in the horticultural world, and although comparatively few professional and amateur gardeners are able to visit the Hon. Vicary Gibbs' fine estate at Elstree, all may read Mr. Beckett's new book and discover therein how he deals with every kind of vegetable crop, including salads and herbs. The directions are simple and concise; every sort of vegetable grown in British gardens is dealt with, and there is an extremely useful calendar of operations, in addition to planting and sowing tables. Naturally, soil cultivation is reviewed at some length, while rotation of crops—an immensely important and interesting subject—receives the attention it deserves, and is illustrated by diagrams showing how rotation may be practised. The common insect, fungous and animal pests of the kitchen garden are discussed at the end of the volume.

Although Mr. Beckett's book is written primarily to assist gardeners in their business of producing vegetables of fine quality and in sufficient quantity for the needs of the establishment, they serve, it contains a large amount of information regarding the growth, preparation and display of vegetables for exhibition. Mr. Beckett objects strongly to the oft-repeated observation that exhibition vegetables are of little value for the table. His own idea in regard to the exhibition of vegetables is that it encourages gardeners to improve their methods of cultivation, select the best varieties, increase the productivity of the kitchen garden, and demonstrate to the public what skill and energy may accomplish.

Mr. Beckett's book may be used freely, because it is well-bound; it is easy to read, by reason of the excellence of the printing and paper; it is a work of great practical value, embodying half-a-century's experience; it is a pleasure to handle and good to look upon, freely illustrated and well indexed. All concerned in its production are to be heartily congratulated upon what appears to have been to them a pleasurable task.

### The Gardener's Year Book.

THIS new publication\* deals with a variety of matters of horticultural interest, and the low price should ensure it a large sale, for there are nearly 400 pages of text and eight illustrations. The text includes a list of the chief Horticultural Colleges and Schools, Horticultural Societies, Botanic Gardens, tables of weights and measures, horticultural fixtures for 1927, reproduced by permission from *The Gardeners' Chronicle Almanac* for 1927; and a host of other useful information, making the book a real work of reference. Articles on many branches of gardening are contributed by well-known horticulturists, and the Editor is to be congratulated both on enlisting the services of so many experts and the choice of subjects dealt with. They include "The English Garden in the Past," by Eleanor Sinclair Rohde; "Herbaceous Plants, New and Old," by Mrs. Philip Martineau; "Plant Hunting in Many Lands," by Ethel Campbell Kennedy; "Rabbit-proof Plants," by the Rt. Hon. Sir Herbert Maxwell; and "The Value of the Garden in the Nutrition of Man," by J. L. Rosedale. The editing has been done very carefully, and the names of plants referred to are spelled correctly. It is somewhat strange that in the list of Botanic Gardens, Oxford University Botanic Garden, which is one of the oldest in existence in this or any other country, is dismissed with two lines, whereas the garden at Edinburgh is discussed in four pages.

## ROSE GARDEN.

## FARRER'S THREEPENNY-BIT ROSE.

MAY I endorse all that Mr. Bowles has written (p. 147) on the subject of this remarkable plant. As a neighbour I have been privileged to see it at all seasons of the year, and desire to add that in his description Mr. Bowles has been extremely moderate and matter of fact. We are most of us acquainted with the garden catalogue that describes some flower or other as "a real gem," that closer acquaintance causes us to discard as mere "paste." The "Threepenny-bit" Rose at any time of the year deserves to be classed as a first-class piece of garden jewellery, and, when in bud, or in blossom, one of those plants it is worth while going a considerable distance to see. Its great sprays, six feet and more in length, studded with a cloud of salmon-pink blossom from tip almost to the butt, strike the eye in June just as much as do the White Daphne and Viburnum fragrans, "Threepenny-bit's" present bed fellows, strike it in February. *Cuthbert James.*

## THE ROSE TRIALS AT WISLEY.

THE report of the annual meeting of the Royal Horticultural Society, which appears in your issue of February 12, gives details of the questions asked in regard to the Rose trials at Wisley. Mr. Robert Fife asked: "whether the special judges appointed to recommend awards in the case of Rose trials now being conducted at Wisley made any recommendations, and if so, what is the nature of them, and are they likely to be given effect to?" Mr. Chittenden, Director of Wisley Gardens, is stated to have replied that the recommendations had been acted upon, and on the questioner asking to what extent, the reply was "as far as possible." That reply did not satisfy Mr. Fife, and rightly so. He then moved: "That the special trial of Roses now being conducted at Wisley be abandoned." This motion was seconded. An amendment was proposed by Mr. Walter Easlea and was duly seconded. In the course of discussion, it is reported, Mr. Chittenden was asked what the recommendations of the judging committee were, and he was understood to reply that these recommendations had not come before the Wisley Committee. He tried to prove that the trials had served their purpose, and that the varieties selected by the judges had proved a great success when planted in the Rose Garden at Wisley.

Concerning the latter point there can be no doubt. What every lover of the Rose is concerned about, however, is not the Rose Garden at Wisley, but the Rose trials there. The question is a very simple one. Why is the Rose Garden a success, and why are the trials a failure? Every grower of Roses who has seen the trials at Wisley must have observed for himself the state of affairs. It is simply deplorable and quite unworthy of the great Society responsible for it.

The Council of the Royal Horticultural Society did receive recommendations from the judges in regard to the trials. Mr. Chittenden admitted this in one part of his statement, and appears to have denied it later on. These recommendations were actually made at the last visit of the judges to Wisley. Mr. Chittenden was abroad at the time, but the recommendations were duly noted by Mr. Musgrave, who was Chairman of the Wisley Committee on this particular occasion, and it seems strange that they were not transmitted to the proper quarter.

It is difficult to understand the attitude of the Council in this matter. An amendment and a motion were put to the meeting, and neither appears to have been voted upon. Mr. Fife, however, received the assurance of the Chairman, Lord Lambourne, that the matter would receive the earnest consideration of the Council. In the interests of the Rose, that statement is very gratifying. Now that the state of affairs at Wisley has been brought home to the Council, it is to be hoped that every endeavour will be made to put things on a proper basis, and that the trials will be worthy of the R.H.S. *Rosarian.*

## APIARY NOTES.

BEFORE proceeding to practical matters, I must return to last month's notes, so far as to give the promised results of Mr. Lloyd R. Watson's work in artificial insemination of queens.

This is the description published in the *American Bee Journal* for February.—"The operation is performed under a binocular microscope, the stage of which is equipped with a Barbour pipette holder, which in turn grasps the barrel of a capillary syringe. The virgin queen is placed, back downwards, into a form carved out of a block of wood exactly to fit her body, the tip of her abdomen just projecting over the edge. She is secured in this position by several loops of silk thread thrown over her body and around the block. The point of the syringe is first pierced through the wall of the seminal pouch of a drone which has just been made to ejaculate by the stimulus of decapitation, and about two-tenths cu. mm. of the pearly-white mucus is taken up. The syringe is then projected on into the region of the active sperm, and this is taken up. The queen, fast on her operating table, is placed on the stage, the tip of her abdomen in the centre of the magnified field. The genito-anal plates are gently pushed apart with fine-pointed tweezers, while the loaded syringe is cautiously advanced into the vagina, and the sperm discharged there. As the syringe is slowly withdrawn, the mucus is forced out of the instrument and left to coagulate as a plug in the vulva of the queen, thus to prevent the escape of any of the semen, and to seal it away from the air."

Readers may judge for themselves whether such a highly skilful operation can ever be made part of the practical routine of a commercial queen breeder. Time will show, but there can be little doubt that this discovery is of quite another order from that of Mr. Gilbert Barratt, who not only proved Dxierzon's theory to be right, but gave us a method of improving our strain of bees which is well within the skill of any intelligent breeder. That the result of his work has proved most valuable is to be seen in the wonderful queens that Mr. Barratt has now begun to distribute. Mr. Watson, on the other hand, is purely a scientist, and the practical value of his discovery has yet to be demonstrated. At any rate, we need to remember, as Englishmen, that it was by an Englishman progress was first made possible, and what was only a German theory proved to be a universal fact.

Now for a few words of practical importance. This is the time of year when more stocks are lost than at any other. The winter has tested the judgment of the bee-keeper and proved whether or no he has left the bees sufficient food. Test each hive at once by lifting, or the first fine day, peep cautiously under the quilts. If food is short, and the weather still cold, feed with candy at once, but if the weather is mild, and the bees flying daily, give them warm syrup by means of a rapid feeder. Some advise a slow feeder. Do not have anything to do with such devices. They are slow torture. Give bees the syrup so fast as they can take it, and be assured they will make full use of every drop. No stimulation is necessary for any bees I have ever known beyond the consciousness of what Doolittle calls "millions of honey at our house." In the same way, never attempt to "spread" the brood. If the queen is worth her place she will spread the brood as fast as the cluster can cover it, and if she does not a new and better queen is wanted. Indeed, now is the time to watch the performance of all queens. Some people tell us to judge the queen by the amount of honey her colony produces. Certainly the honey crop is the great test of value, but the honey crop is decided within the next two months. If a stock builds up rapidly from now on, there will not be much doubt about the crop, and if not, there cannot be a crop. An old queen, or an inferior queen, now means no bees in quantity later, and a young queen of good strain now means slabs of brood right up to the honey flow, and a tornado of harvesters when the crop comes along.

See to it that the hive is snug and snugly placed. Cold winds hinder developments greatly. Heat is vital to a stock, and, as the bees have to make it all themselves, protect them from all avoidable waste. The gardener who watches so carefully the thermometer in an early vineyard when the east wind blows its hardest does not need to be told to turn next to his hives and watch them too. A windbreak is vital. Plenty of food and conservation of heat is all a stock needs during the next few weeks. *John Marie.*

## NEW DISEASE OF FREESIA.

I HAVE read Mr. Longford's article (p. 118) with much interest, but I am afraid I cannot give him much information concerning this new and troublesome disease of Freesias. My experience of it is very limited, but I am certain it is not due to insect pests of any sort on the foliage. So far as my own stock goes, it is not apparent, but the Whitewell stock shows evidence of it, and I think it would help if one could find out the how, when and where of its first appearance.

The variety Excelsior, so far as my experience went, was a poor grower, and as it is seven years since I grew it, I cannot remember whether the disease mentioned by Mr. Longford was present on the foliage. He states that seedlings fall victims to the disease, and as no fungus or bacteria can be found on the foliage, it leads me to think that the trouble is "in the blood." I wonder if Mr. Longford or any one else has examined the corns externally, and internally as well, also the older outer skin of diseased corns. If there is no form of fungus or bacteria present, I suppose there is no means of infection on the foliage, so I cannot see how dusting with sulphur can have any effect.

I do not think I have found or heard of disease in any of the Dutch-raised stocks, which are the oldest in commerce. I wonder if Californian-grown stocks have it. The late Rev. J. Jacob had it in his stocks at Whitewell, but how did it occur? Possibly Excelsior "blood" or close in-breeding weakened the constitution and by not taking immediate steps to control it, the trouble has spread.

If no form of infection can be found on leaf or corn, I think the trouble must be a hereditary one, and therefore I presume more difficult to cure. *G. H. Dalrymple.*

## FRUIT GARDEN.

## BIENNIAL CROPPING IN APPLES.

As a contribution to the discussion on biennial bearing in Apples which has been carried on in recent issues, it may be worth mentioning that American growers claim to keep most varieties in a state of regular bearing by giving a dressing of nitrate of soda two or three weeks before blooming. Incidentally, they find that this gives them a fuller set of fruit. In the case of some varieties which have the biennial habit in a very pronounced degree this treatment does not overcome the trouble. One of the American experiment stations has started a trial of the effect of a second dressing of nitrate of soda given in mid-September of the "off" year in the case of these stubborn varieties. The idea, suggested probably by a somewhat similar experiment which was carried out in this country, unfortunately without proper control trees, is that the autumn dressing helps the trees to store carbohydrate materials which they can use in the spring for the formation of fruit buds to bear in the following year, which normally should be the next "off" year. Some indications of success are reported.

I have, on several occasions, given a spring application of nitrate of soda to trees on grass land, and am doing so again this year, not with much hope of influencing bearing, but because I have found it the best way to get growth in

these conditions; and some of my trees, as already mentioned, would be all the better for a little more vigour. To test the effect on bearing the treatment would have to be conducted over a series of years, and then it would not be conclusive unless proper controls were arranged. American writers say that trees of low vitality in grass will nearly always respond to nitrate of soda; and I think they are right. In the case of plantations under clean cultivation, I have never obtained much result from the use of mineral fertilisers, and now always use farmyard manure or, more often some organic substitute, such as shoddy or meat meal. *Market Grower.*

## VEGETABLE GARDEN.

### CELERY TRENCHES.

It is an excellent practice to prepare Celery trenches quite early in the year, for early preparations result in the soil being more amenable to banking than when it gets dry from sun and wind, and further, the work is heavy and more or less tiring if deferred until hot weather sets in. Another consideration favouring early

the first outdoor sowing of early Carrots and of the earliest Brassicas.

Not every gardener practices the cropping of Celery banks or ridges, but where there is a shortage of ground the system is worth adopting to gain the extra crop; also in the case of gardens run commercially, where every foot of space has to be utilised.

Respecting the actual making of Celery trenches, much interest attaches to the way they are prepared in different counties. Around this district there is a great aversion to making trenches wide enough for double planting, and I have yet to see such a trench about here in market gardens and small private places. The distance between the rows allowed by most of these growers is one yard only, never more than forty-two inches, and the trench itself one spade wide. Such alleys are extremely neat-looking and suitable for a single row of plants; but with these narrow rows there is always the danger of the sharp sides slipping or crumbling before the Celery is dug for use, yet the narrow base and correspondingly steep bank has the great advantage of the plants being practically immune to water-logging in wet seasons. The contrast between these narrow rows and the broad ones made in the average

hairy. It is one of the earliest varieties, but, unfortunately, a poor grower, and cannot be recommended for its weight of produce, but simply as a variety for the connoisseur.

The late Rev. W. Wilks, who was recognised as an authority on flavour, both in fruits and vegetables, thought most highly of this variety, and possessed a splendid bed of it in his garden at Shirley.

Stott's Monarch is an entirely different variety, very coarse in every respect, but undoubtedly one of the best for use as a preserve. It is a most unattractive and unappetising looking Rhubarb. The sticks are long and exceptionally thick; the outside colour is a dull green, the inside a paler shade of the same colour, and the flesh is extremely acid. The leaves are very large and a pale glaucous green. This variety is a robust grower, but one of the latest to start into growth.

Although any Rhubarb may be used for making jam, this variety is especially good for the purpose. *J. Wilson, Wisley.*

## HOME CORRESPONDENCE.

**Lathyrus tuberosus.**—Mr. T. W. Briscoe's note on p. 73 adds a new county to those already recorded as having produced specimens of this plant. Miller Christy summarised these records in the *Journal of Botany* for July 1910, and J. C. Shenstone wrote some further notes on it in the December issue of the same year (see also Gibson's *Flora of Essex*, 1862, p. 88, where there is a good coloured plate). The plant is well established in Essex at Fyfield and in Canvey Island, and has been recorded also from Devon, Durham, Surrey, Sussex, Norfolk, Suffolk, Glamorgan and Lincolnshire; some of these records are, however, open to doubt, and in most of the others it is an obvious accidental introduction. Essex, Suffolk and Sussex appear to be good localities for it, but there is very little, if any, doubt that it is in no sense a native British plant, being so commonly distributed on the continent and easily introduced with Corn or other produce. Mr. Briscoe omits to mention one of its pleasantest attractions, viz. its sweet scent. I have it in my garden here, and it comes up all over my rockery by virtue of its underground stolons, and reaches a height of four feet to five feet when trained up supports. The tubers are scarcely small, except at first, as I have dug them up when three to four inches in length and an inch thick. I grew my stock from seed from the Canvey Island plants. Each tuber sends out several stolons which come up over a square foot or so of ground and the growths are best trained together up a galvanised netting (or similar) cylinder. My plants seed fairly freely, but by no means abundantly. *C. Nicholson, Hale End, E. 4.*

— **Lathyrus tuberosus** was found in 1907 growing on a bank of the G.W.R. near Keynsham, Somerset, and is probably there still; previous to that it was also discovered in one or two other places in Somerset. I have it in my garden, grown from seed, but I find it only a weakly grower. *Mrs. E. J. Thatcher, The Manor House, Chew Magna.*

**Good Daffodils for Forcing.**—I can endorse the statement made by G. S. D., on p. 127, that King Alfred is a suitable variety for early flowering under glass and lends itself admirably to gentle forcing. Our bulbs were potted on September 27, and plunged in ashes for ten weeks; they were then placed in a cold frame for a period of four weeks, being afterwards grown on a shelf in a cool greenhouse. The first blooms, which opened on February 15, were of good colour and size, and the stalks attained a height of eighteen inches. The foliage is stiff and does not require staking. Another fine Daffodil amongst the same batch is Spring Glory. This variety is more floriferous than the former and one that I can well recommend for growing under glass. For blooming at Christmas, I find there is none that can compare with Cervantes. Plants comprising a batch of this variety, potted and plunged on August 19, were in full bloom at the festive season and were greatly appre-

FIG. 84.—LETTUCES BETWEEN CELERY TRENCHES.

preparation of the ground for Celery is that some gardeners make other use of the trenches before planting them with Celery. Two such uses include the raising of various seedlings and giving protection to early, half-hardy subjects. This custom, however, is not to be seriously advocated in good gardens, as it disorders the trenches and tends to rob the soil of much plant-raising be done.

Cropping on the banks by the side of the trenches, as shown in Fig. 84, is another practice to which objection can be raised, but not so seriously as in the former case, because such planting does not interfere with the rooting material of the Celery. But planting too thickly must be guarded against, and still more, allowing the crops to remain until they are so big as to exclude light and air from the Celery plants.

Intercrops suitable for planting on the banks are, however, very few, the one most generally grown being Lettuce. This crop may be either sown direct on the bank and the plants thinned in the usual way or raised elsewhere and transplanted. Turnips and dwarf French Beans are other crops suitable for this position. Later sowings of Radish may also be made on these ridges of soil, the first sowing having been made in the trench itself. Two other possibilities are

private garden is most noticeable. Manure is used, but not dug in the trench; it is simply laid on the bottom of the trench and covered by trimming down the banks on both sides.

A special spade is used by Celery-growers in this district, the blade being perfectly flat and straight, as distinct from the usual concave blade of most garden spades. I have not seen its like in any other county it has been my lot to garden in, and a Bedfordshire ironmonger informed me that this type of spade is made to order for certain parts of this county. *C. Turner, Amphill Gardens, Bedfordshire.*

### RHUBARBS TOBOLSK AND STOTT'S MONARCH.

THESE two varieties of Rhubarb are not very well-known, and a few notes on them may prove of interest.

Tobolsk is a choice variety and possesses a distinctly good flavour, said by some to be suggestive of stewed Plums. The stalks are a dark red colour on the outside, but the inside colouring is not so intense. They grow from fifteen inches to eighteen inches long, are rather thin and deeply grooved. The leaves are quite small, dark green in colour and very

ciated. Although of small size, practically every bulb developed two, three and some four blooms. Like *G. S. D.*, I use no manure beyond adding a five-inch potful of bone-meal to each bushel of compost. *W. E. Wright, Tregarth Gardens, Creigiau, Near Cardiff.*

**Deep Trenching.**—I have been very interested in the discussion on Deep Trenching, and I thoroughly disagree with Mr. E. Beckett's methods (p. 135), when he advises bringing the subsoil to the surface. In the soil there are millions of micro-organisms—bacteria, which decompose the raw materials so that plants can absorb them. These bacteria practically live on humus and cannot exist in the absence of air, therefore they cannot survive much below a depth of twelve inches; from these facts it cannot be beneficial to plants to bring the sour subsoil—which is generally deficient in humus—to the surface and bury the bacteria-peopled soil. I thoroughly recommend deep trenching, but prefer to keep the subsoil in its natural position, digging into it large quantities of organic material that will not only form humus but facilitate drainage so that in time the subsoil becomes much improved. *Gavin Brown, Craigro Gardens, by Montrose.*

—*G. D.* invites, on p. 73, other readers to give their views on deep trenching. I always advocate trenching, but after one experience in Sussex, I have been very chary of bringing the bottom spit to the surface, as Mr. Beckett advocates. I had occasion when there to take in a piece of a field to augment the kitchen garden, and trenched it two feet deep, bringing the bottom spit to the top. The cowman on the estate had a part of the same field as a garden for a new cottage. He simply dug his ground one spit deep as in ordinary digging. Both pieces of land were planted with Potatoes, and he lifted a splendid crop, while I did not get so many out as I put in! I have a crop of late Broccoli in the garden here which was planted without digging the land, after Strawberries—which had occupied that ground some years—were cleared off. The plants look just as well as Mr. Beckett's do on the trenched ground shown in Fig. 217, vol. LXXX. I have seen huge plants grown at the end of fields where horses had made the soil hard when turning during ploughing and clearing operations. *Grigor Roy.*

**The Daffodil Fly.**—My attention has been called to an article on "The Daffodil Fly," by Mr. A. J. Bliss, published in your issue for December 25 last. I was most interested in the information contained therein, more particularly as I have been working on bulb fly problems for the past three years, and it seems that a few additional notes might be of interest. My earliest record for *Merodon equestris*, indisputably hatched in the open is April 7, and the last emergence date June 20, these records both being made in South Devon. The period of maximum emergence is usually the latter half of May, egg-laying being commenced in early June. I have no information regarding the possibility of the grub remaining for two seasons in the bulb, but at the same time there is no doubt that half-grown and three-quarter-grown larvae can and do migrate through the soil and enter healthy bulbs. Any one who doubts this ability has only to confine one in a tin with a sound bulb overnight. By the following morning the larvae will be found to have entered the bulb, usually at the junction of the basal plate. I wonder if the larvae found by Mr. Bliss in his plots of covered bulbs could have been the progeny of early-hatched flies, which had entered by migration through the soil in this way. With regard to the last paragraph in the above-mentioned article, in the course of examining several hundred bulb samples obtained from commercial growers, I have recorded numerous cases where the small bulb flies, *Eumerus tuberculatus* and *E. strigatus* have constituted the sole cause of injury. Experiments carried out have shown beyond dispute that, given favourable conditions, the larvae will enter bulbs originally entirely healthy. A publication covering this work will appear in an early number of the *Bull. Ent. Research*. *W. E. H. Hodson, Seale-Hayne Agricultural College, Newton Abbot.*

## GARDENS AT OLYMPIA.

THE display of various types of gardens at the Ideal Home Exhibition at Olympia, West London, has become a permanent annual institution, and is invariably visited by a large number of the public.

With a greater attention to co-ordination on the part of the management, the general effect of the score or so of gardens is much more pleasing than formerly. Immediately on entering the Garden Annexe the visitor cannot fail to be agreeably impressed by the genial atmosphere of graceful displays of spring flowers.

A freer style of design has been adopted by the exhibitors, which is admirable, but from the individual and the general points of view, it is no easy matter to co-ordinate effectively a number of self-contained garden exhibits, often of totally different character, yet at Olympia the attempt has been exceedingly successful, and from several view points entrancing garden pictures are to be enjoyed.

As we have already suggested, the first general impressions are distinctly good. From a point a little to the left of the entrance to the Riviera Tea Garden a charming view, across the full width of the building, may be obtained. Here, with the most pleasant rock garden of the Central Garden Supplies Co. in the foreground, across the glowing trusses of *Azalea mollis* and the graceful standards of *Pyrus Malus atropurpurea* in Mr. G. G. Whitelegg's Round Garden, on to the elegant marble fountain which tops the Italian garden so well arranged by Messrs. J. Carter and Co., is a scene of such beauty as seldom, if ever before, has been presented by any exhibition.

There are several other "garden pictures," worthy of prolonged enjoyment, and these the visitor will doubtless readily discover. But, although the general merits of the gardens are of high quality, these remarks do not apply equally to all. Nor could it be expected, in the nature of things and the circumstances, that it would be so. It is to be expected that the garden designer has what, for a better word, is termed a *motif*. In most of the Olympia gardens this is readily apparent, but in a few the visitor is left puzzled and wondering what the general idea is. Certainly these few gardens were not conceived by what the management is pleased to term "Master Designers," or if so, there was considerable failure in the making.

We were pleased to note that in most of the gardens much more attention has been paid to "finish" than on some former occasions, yet there is still room for further improvement in this respect. As with too many of the present-day houses, the designer seems to have exhausted himself on the front elevation, leaving the remainder raw. This certainly should not be in an exhibition such as that at Olympia where, in most instances, the visitors may walk all round the garden as well as within it.

The general idea of the organisers was that the selected nurserymen should demonstrate to the public the many and varied possibilities of quite small parcels of ground, and of nearly all possible shapes. On this account the Garden Annexe provides a valuable object lesson to the garden lover, which he is evidently keen to take the fullest advantage of, and there is a most agreeable diversity of styles for his consideration.

For the person of means, who wishes to have a fine garden in a relatively small area, Messrs. J. Carter and Co. have made a fascinating Italian garden. The elegant marble fountain, artistically set amid upright Cypresses is on a terraced knoll. In the middle distance twin circular fountains provide ample jets of water, and those are surrounded by narrow beds of *Dicentra (Dielytra) spectabilis*, while on the lower ground there are luxuriant flower beds of Bouquet Pink and Bouquet Blue Cinerarias, also of the pretty little *Azalea Hinodigeri*. The whole garden is flanked with lofty Cupressus behind borders of fruiting Oranges and flowering shrubs, while just the right proportions of excellent Daffodils supply the needful spring glow of rich yellow colour.

Forced shrubs are freely used in many of the gardens. Messrs. J. Cheal and Sons have very successfully grouped a generous quantity at one end of the formal garden of Polyantha Roses. Beautiful standards of Wistaria, Laburnum, Brooms and Japanese Cherries rise gracefully above the floriferous bushes of Lilacs, Diervillas, *Prunus triloba* fl. pl., Magnolias and other subjects.

In his handsome Round Garden, Mr. G. G. Whitelegg has planted exceedingly good specimens of the valuable hybrids of *Azalea mollis* and *A. sinensis*. The chief are Emile Liebig, bearing trusses of orange-tinted flowers, Anthony Koster, of glowing yellow, and J. C. van Thol, of vivid salmon-yellow shades. His specimens of *Magnolia Soulangeana nigra* and *M. conspicua* are also exceedingly good.

A satisfying border of forced shrubs in the garden of Messrs. L. R. Russell, Ltd., flanks the paved path leading to the excellent little conservatory, built by Messrs. Wm. Duncan Tucker and Sons, where, in the middle, there is a Banana (*Musa Cavendishii*) carrying a large bunch of ripening fruit. On the side stages plants of *Azalea indica*, *Epiphyllum truncatum*, little Oranges in full fruit, and other subjects render it gay and bright.

Shrubs also enter largely into the scheme of Messrs. Skelton and Kirby, whose "English Spring Garden" is in three sections. They have planted Magnolias, Forsythias, Pyruses, Prunuses and Heathers.

Rock gardens are fairly numerous. We have already mentioned that of the Central Garden Supplies Co., and this is particularly successful in its homely, satisfying simplicity. It is such a garden as one could happily live with. The boulders are correctly placed, and with a wise restraint which permits the proper planting of fair breadths of plants. It has been made and planted with the view of providing suitable aspects for the four seasons, and for the growing of all kinds of alpine. The many rock garden plants are all well-grown examples. The centre of the site has been laid out as a paved plateau with beds of Hyacinths and surrounded by tasteful borders of flowering shrubs.

Mr. Herbert Brook has a low, spreading rock garden with pools of water. The Orpington Nurseries Co., have a large, undulating garden of rockery interspersed with broad sweeps of Heather and Grass overplanted with graceful young Birch and Beech trees. Near the entrance, the Country Service Association has a gentle slope with rock and pools. In addition to his formal garden, Mr. G. G. Whitelegg has a well-designed rock garden and, at one end, a magnificent specimen of *Daphne Mezereum*.

In their space, Messrs. R. Wallace and Co. have contrived to illustrate several distinct types of garden. The chief feature is an ornate stone, rag-tiled summer-house, with a paved enclosure containing a canal and pool. The enclosure contains borders of Tulips, while all around there are banks of many interesting and valuable flowering shrubs—Pyruses, Prunuses, Magnolias, Brooms, Rhododendrons, Azaleas, Lilacs and *Daphne Mezereum*. Messrs. Bakers, Ltd., have a village pump, with a trough from which the water overflows over a cobbled causeway to a pool. On a raised border there are good examples of various Rhododendrons, *Viburnum Carlesii*, Brooms and other shrubs, with breadths of *Primula Wanda* and *Iris reticulata*. Messrs. Burton Holt (Chelsea), Ltd., have a pair of handsome wrought-iron garden gates with ornamental stone pilasters set on a stone terrace. Messrs. J. Klinkert filled two spaces with a great variety of Topiary work, chiefly in *Buxus sempervirens*.

A garden of Perpetual-flowering Carnations, planted by Messrs. Allwood Bros., is an excellent example of the special garden. It contains a great many plants of the best varieties, in full bloom, while smaller beds are filled with *Dianthus Allwoodii*. Generous breadths of bright colours are present in the Anemone Garden of Messrs. Reamsbottom and Co., who have large quantities of the brilliant *Anemone fulgens*, as well as of their well-known strains of St. Brigid and De Caen Anemones. Mr. Baldwin Pinney has a large terrace garden planted with many varieties of Violets and *Primula Wanda*.

## SOCIETIES.

## BRITISH MYCOLOGICAL.

A MEETING was held at University College, London, on Saturday, January 22, when, in the absence of Dr. E. J. Butler, President, Dr. G. H. Pethybridge took the chair.

The first paper was by Mr. W. Buddin and Miss E. M. Wakefield, on *Rhizoctonia Crocorum* (Pers.) DC. and *Helicobasidium purpureum* (Tul.) Pat. *Rhizoctonia Crocorum* has long been known as a root parasite of numerous plants and various suggestions have been made as to its mode of reproduction. The important new fact is now added that there is a very intimate association between the Basidiomycete *Helicobasidium purpureum* and *Rhizoctonia Crocorum*, though the exact nature of the relation has not yet been ascertained. Root-rot characterised by the presence of infection cushions which are typical of *Rhizoctonia Crocorum* has been found in every locality where *Helicobasidium* has been noted. Further, the association is so close that in two strains of *Rhizoctonia* isolated in the same way from infection cushions, conidia similar to those obtained from *Helicobasidium* have been produced in culture. Morphologically, the hyphae of *Helicobasidium* are exactly similar to those of *Rhizoctonia*, having the same type of branching septation and absence of clamp connections; the nuclear characters are also similar, both fungi having sometimes one, but more often more nuclei in a cell. Seven strains of *Rhizoctonia* have been compared with numerous spore isolations of *Helicobasidium* as to cultural characters. Both fungi show considerable variation in colour and type of growth. Conidia belonging to the genus *Tuberculinia* are frequently produced in cultures of *Helicobasidium* and similar conidia have been found in strains of *Rhizoctonia*. In cultures of *Helicobasidium* which originate from multiple spores, there sometimes develop strains in sub-culture which are sterile and acquire the dark colour characteristic of the sterile *Rhizoctonia* strain; a similar variation has arisen in a strain of *Rhizoctonia*. Successful inoculations with the production of typical root rot have been obtained with four strains of *Rhizoctonia*, and with three of the dark coloured strains described from *Helicobasidium* spore culture.

There were a number of observations which were discussed. While there have been inconsistencies in behaviour, it is possible that these are due to the fact that the organism is very variable, and that not all strains are equally parasitic.

The balance of the evidence is considered to favour the view that *Helicobasidium purpureum* (Tul.) Pat. is the perfect stage of *Rhizoctonia Crocorum* (Pers.) DC.

Dr. R. C. Woodward followed with an account of his studies on *Podosphaera leucotricha*, the Apple Mildew. Axillary buds of the Apple become infected a full season before opening, entry being effected at an early stage. The scales of the buds often leave a gap at the tip through which mycelium from the shoot passes and becomes established between the tissues within. Fruit bodies on the terminals of spurs are also infected from the infected fruit bud immediately preceding and adjoining the rudimentary buds. In all bud infections the mycelium becomes established within the tissues early in the season, and later penetration is prevented by bud scales. Sections show that living mycelium occurs between all their composing elements, and on the approach of winter that situated between the exterior scales loses its vitality. Haustoria are present and appear to play the main part in perennation, as no thickening of hyphae or chlamydospores were seen. In infection, a small area of the host under the germ tube near but not at the tip, takes on a light brown or yellow colour. A pit-like cavity in the cuticle suggests chemical rather than mechanical action. A heavily infected young bud never attains its normal expansion or shape but tends to be slightly or decidedly dwarfed or somewhat elongated.

No specialised races of the fungus were found. Conidia produced on the various Apple varieties, on Quince and on Pear are capable of bringing about normal infection of each host plant.

After lunch Miss Kathleen Sampson gave an account of Anthracnose of Red Clover. The causal organism of Anthracnose of Clover in this country is *Gloeosporium caulivorum*, Kirchn. (= *Kabatella Karak.*) The attack is almost entirely confined to the stems and petioles. The general effect of a field attack is one of blackened and broken stems, withered petioles and brown, dead leaves. At an early stage of infection badly infected plots, show a lighter appearance than healthy plots, due to the large number of leaves which, hanging from wilted leaf stalks, expose their lighter under-surface. From the farmer's point of view an attack of "scorch" means a considerably reduced hay crop and weakened plants. Secondary shoots are thrown up by badly infected plants before the first hay crop has been taken, and the second cut is therefore reduced, even if it should escape an attack of the disease. The fungus appears most severe on early-flowering Red Clovers. Although within a strain individual plants of Red Clover showed marked resistance to the disease, an immune plant has not yet been discovered. A characteristic of the fungus, both in culture and on the host, is the scanty development of mycelium. In diseased tissues it is obscured to a large extent by the brown material which ultimately fills the cells attacked by the fungus. A series of inoculation experiments of various Leguminous plants showed that in addition to *Trifolium pratense*, only *T. hybridum*, *T. repens* and *T. suaveolens* proved capable of infection. The behaviour of the fungus in culture was described: any cell of the fungus may bud off conidia. Penetration of the host cells was observed from the third to the fifth day after sowing spores on the stem. The first indication of entrance was a distinct brown colour in the wall of the epidermal cell upon which the spore rested. The entering hyphae appear to travel for some distance in the cell wall immediately below the cuticle, but did not penetrate the cell. The cell walls were distinctly swollen for some distance in front of the germ tubes. The parasite travelled at first only in the cell walls and intercellular spaces, the path of invasion being marked out by a brown discoloration of the cell wall, and finally by dark almost black cell contents. The mycelium was scanty and difficult to trace until the tissues were completely disorganised, when coarser strands of mycelium were found from which the conidiophores subsequently developed.

The growth of the fungus on different culture media was outlined. Sclerotia-like bodies were formed on several media. Under laboratory conditions infected seeds give rise to diseased plants, but so far infection by this method has not been observed in the open, and the probability of the occurrence in nature appears to be small; here the fungus persists during the winter months in the petioles of leaves infected in late autumn in which the fungus develops very slowly. A short comparison was made with *Colletotrichum Trifolii* which has not, so far, been recorded for Europe. The general symptoms are the same. In inoculation experiments the germ tube forms a spherical appressorium from which arises a penetrating hypha which becomes intercellular, passing from cell to cell.

Mr. E. W. Mason followed with a paper "On the Naming of a Dark-Spored Hyphomycete." This was of great systematic interest but does not lend itself to a summary here.

Mr. J. Ramsbottom continued his series of "Fragmenta Mycologica." A lantern slide was shown of a clump of seventeen field Mushrooms with their stalks joined; another of an old group of mycologists—M. Cooke, W. G. Smith, Broome and Plowright—and one of the recent Hereford Foray. An account of the late C. G. Lloyd, the American mycologist, was then given.

As usual, the papers were followed by interesting discussions.

## MANCHESTER AND NORTH OF ENGLAND ORCHID.

At the meeting held on Friday, February 18, the members of Committee present were Mr. J. B. Adamson (in the chair), Mr. R. Ashworth, Mr. A. Burns, Mr. A. Coningsby, Mr. D. A. Cowan, Mr. J. Cypher, Mr. J. Evans, Capt. W. Horridge, Mr. A. Keeling, Mr. D. McLeod and Mr. H. Arthur (Secretary).

Mr. A. T. Sutton was invited to sit with the Committee.

## FIRST CLASS CERTIFICATES.

*Odontoglossum Monarch* var. *Brilliant*.—A magnificent variety, flowers very large and of fine shape; all the segments are heavily blotched with rich violet, with white margins. From Mr. J. B. ADAMSON. A Silver-gilt Medal was also awarded.

*Cattleya Rajah*, *Llewelyn's* var. (*Enid* × *Empress Frederick*).—A splendid variety with large, well-shaped flowers; the broad sepals and petals are of a rich mauve colour; lip large, rich velvety purple with rose spots. From G. V. LLEWELYN, Esq.

## AWARDS OF MERIT.

*Cattleya Tityus* var. *Imperial Prince* (*Octave Doin* × *Enid superba*); *Laelio-Cattleya* H. T. Pitt, *Llewelyn's* var.; *L.-C. Serbia*, *Llewelyn's* var.; *Cypripedium Eurybiades*, *Llewelyn's* var.; *Dendrobium*?, *Hesketh Park* var.; and *D. plumbtonense*, *Llewelyn's* var. All from G. V. LLEWELYN, Esq.

*Odontioda Brackenhurst*, *Bronze Queen*; *O. Sensation* (*Oda. Vuylstekeae* × *Odm. crispum*); *Odontoglossum Queen of the Belgians* var. *Perfection*; and *Cypripedium Elise*, *Towneley Grove* var.—From J. B. ADAMSON.

*Odontioda Juno*, *Woodside* var. (*Oda. Coronation* × *Odm. Eximilis*).—From Messrs. SUTTON BROS.

## AWARDS OF APPRECIATION.

*Cypripedium Archmanii* (*Archimedes* × *Beekmanii*).—From Mr. J. B. ADAMSON.

*Dendrobium plumbtonense*, *Prince's Park* var.—From G. V. LLEWELYN, Esq.

## BOTANICAL CERTIFICATE.

*Pleurothallis Roetzlii*, from Mr. J. B. ADAMSON.

## CULTURAL CERTIFICATES.

To Mr. J. HOWES, for *Odontioda Sensation*, and to Messrs. SUTTON BROS. for *Odontoglossum naevium*.

## GROUPS.

Mr. J. B. ADAMSON (gr. Mr. J. Howes), staged a group for which a Gold Medal was awarded; *Odontoglossums* in variety, including *O. Monarch* var. *Brilliant*, *O. Queen of the Belgians* var. *Perfection*, *O. harvengtense*, *Pitt's* var., and *O. Pegasus* var. *Stanley Baldwin* were conspicuous, as also were *Odontioda Brackenhurst* var. *Bronze Queen*, *O. Sensation* and *O. Margaret*, with *Cypripedium Elise*, *Towneley Grove* var., *C. Perseus* var. *Ruth*, *Lycastes* of the Skinneri section, *Dendrobium Wardianum* in variety, and *Pleurothallis Roetzlii*.

Mr. G. V. LLEWELYN, Norwood Avenue, Southport, was awarded a Large Silver Medal for a group of *Cattleyas*, including *C. Rajah*, *Llewelyn's* var., and *C. Tityus* var. *Imperial Prince*, *Laelio-Cattleya* H. T. Pitt, *Llewelyn's* var., and *L.-C. Serbia*, *Llewelyn's* var.

Messrs. J. CYPHER and SON, Cheltenham, staged a group to which a Silver Medal was awarded. This contained *Dendrobium aureum*, *D. Cybele nobilior*, *D. Ainsworthii*, *Cymbidium Albatross*, *C. Alexanderi*, *Odontoglossum nebulosum*, *Masdevallia Bocking Hybrid*, *Coelogyne cristata* var. *Lemoniana* and *Cypripediums* in variety.

Messrs. SUTTON BROS., Hassocks, Sussex, staged a group to which a Silver Medal was awarded. In it were *Odontioda Juno*, *Woodside* var. *O. zebrina*, and *O. Royal Gem*; *Dendrobiums*, *Brasso-Cattleya Griselda*, and *Cypripediums* in variety.

Messrs. KEELING and SONS, Bradford, staged *Cypripediums*, *Odontoglossums*, *Odontioda Jasper*, and *Angraecum sesquipedale*.

The Secretary reported the death of Mrs. Gratrix, a keen supporter and exhibitor from the inception of the Society.

## TRADE NOTES.

## EXPORTING PLANTS TO NEW ZEALAND.

In December last we received three cases of plants from England containing about five hundred different kinds, and as your paper is read by so many interested people, I would like to give a little advice on the subject of packing, as I believe it is possible to send almost any plant out here safely. One lot containing about two-hundred-and-twenty plants came through with about ten losses. If one consignment containing 120 plants had been properly packed, the losses would not have exceeded five. These were all in pots, and the case was divided into two sections; those in the bottom section arrived in perfect condition, but the top set was a mixed mass of broken pots, soil, plants and moss. I mention this to show the need for careful packing. Some of the plants (about twenty-five per cent.) I shall save, but it will be impossible to tell what they are, so that for want of a little extra care, the good work is undone. I believe the most successful consignments to New Zealand will be those sent in pots, so long as wet moss is packed around them and the pots are made secure.

It is very important to consign through a reliable shipping firm in London; see that the plants are not packed one day earlier than needed by the shippers; pack all plants with wet moss around the pots and thoroughly soak the moss before using it; see that the pots are firmly secured when in the cases, so that there is no possibility of movement during the journey; ensure that there is plenty of air space in the case; make an opening on each side of the case, at least three inches wide, and cover it with perforated zinc; do not make the cases too big, as small cases are easily handled and so do not get the shaking large ones do; send an invoice to the shipping agent and also one direct to the consignee, to arrive before the cases; send the proper agricultural certificate to arrive at the port of destination before the plants; do not allow the shipping agents to despatch the plants unless proper arrangements have been made with the steamship company, because it is only waste of time and money to send plants as general cargo.

A member of the Alpine and Rock Garden Society (Nelson) recently had £38 worth of plants sent from England; all were dead on arrival, as the shippers had sent them as ordinary cargo. Repetitions of such failure will kill business; this is a matter that should be taken up by nurserymen at home.

A big consignment is due to arrive in March, and I shall report its condition in due course. A. Wilkinson, Examiner Street, Nelson.

## Obituary.

**Mrs. D. Airdrie.**—Many friends in England as well as in Scotland will be very sorry to hear of the great loss sustained by Mr. David Airdrie, Dunlop House Gardens, Dunlop, Ayrshire, by the death of his wife, on the 22nd inst. Mrs. Airdrie has been seriously ill for some considerable time but bore her trouble with great patience. The sympathy of all his friends will be extended to Mr. Airdrie.

**W. H. Etterley.**—Mr. Etterley, Assistant Superintendent of the Public Parks, Shanghai, died suddenly at Shanghai on December 29, 1926. Mr. Etterley commenced his gardening career at Belvoir Castle Gardens, under Mr. W. H. Divers, and as he proved very studious, he was chosen by the late Mr. F. W. Burbidge as an assistant at Trinity College Gardens, Dublin. His next move was to Kew, where he obtained further knowledge. He left there in 1909 to take up work at Shanghai. Mr. Etterley was forty years of age, and leaves a widow and two children to mourn his loss.

**Julien Potin.**—Many Orchid lovers will regret to learn the news of the death of one of their number, M. Julien Potin, of Neuilly, Paris, who passed away at the end of January. M. Potin, one of the best-known amateur

Orchid-growers, had a perfect passion for Orchids, of which he had a magnificent collection at his beautiful home at Neuilly-sur-Seine. He was President of the Orchid Committee of the French National Horticultural Society, and founded special prizes to be given to exhibitors of Orchids at the Society's exhibitions, notably the coveted Potin Cup. M. Potin will be sadly missed by his friends and colleagues, by whom he was greatly beloved and esteemed. He was a Commander of the Legion of Honor. The hybrid Orchid genus of Potinara (*Brassavola* × *Cattleya* × *Laelia* × *Sophranitis*) was named after M. Potin.

**W. P. Thomson.**—We regret to record the death of Mr. W. P. Thomson, which occurred on Friday, February 25, at his home, 25, Bollo Lane, Chiswick, in his seventy-eighth year. Mr. Thomson retired from the editorial staff of *Gardening Illustrated* at the end of last year, but he contracted influenza and died within eight weeks of his retirement. He was born on September 27, 1849, at Easter Skene—an estate about eight miles to the north of Aberdeen, where his father was a gardener. At the age of eighteen years he was apprenticed to Mr. John Clark, who was then gardener at Brodie Castle. Leaving these famous gardens, he went to Fyvie Castle as outside foreman and from there he passed to Linkfield House Gardens, Musselburgh. In 1874, he joined the staff of the Royal Horticultural Society at the old Chiswick Gardens, as clerk to Mr. A. F. Barron, who was then Superintendent. In 1887, his association with Mr. William Robinson commenced, and he became sub-editor of *The Garden*, continuing in that position until 1900, when he took over the editorship of *Gardening Illustrated*, which was founded on March 1, 1879. Mr. Thomson was a member of the Floral Committee of the Royal Horticultural Society. For many years he was a member of the Executive Committee of the Royal Gardeners' Orphan Fund, and Treasurer of the United Horticultural Benefit and Provident Society. In February, 1926, he was honoured with the award of the Veitch Memorial Medal in gold for his contributions to horticultural journalism. The funeral took place at Acton Old Cemetery, Churchfield Road, on Monday, February 28. Mr. Thomson will always be remembered for his devotion to duty and his painstaking care in all that he undertook.

## ANSWERS TO CORRESPONDENTS.

**FLOWERS FOR CUT BLOOMS.**—E. J. C. The following varieties of annuals and perennials are suitable for use as cut blooms. The plants may all be raised from seeds. *Red*: *Acroclineum roseum*, various *Asters*, *Cacalia coccinea*, *Carnations* in variety, *Godetia Schaminii*, *Dwarf Rocket Larkspur* and others, *Lychnis chalcidonica*, *Lychnis* (syn. *Agrostemma*) *Coeli-rosa*, *Papaver nudicaule minimum*, *Pyrethrum roseum*, *Rhodanthé Manglesii*, *Salvia splendens* in variety, *Scabious* in variety, *Statice sinuata rosea*, *Stocks* in variety, *Wallflowers* of red shades and *Zinnias*. *Blue*: *Anchusa italica* *Dropmore* variety; *Centaurea odorata*, *Campanula persicifolia*, *Centaurea Cyanus*, *Delphinium sinense*, various *Stock-flowered Larkspurs*, annual and perennial *Lupins* in variety, various *Myosotis*, *Nigella Miss Jekyll*, *Statice sinuata Puce Blue*, *Salvia patens*, *Scabious caucasica*, various *Stocks*, and *Veronica spicata*.

**PELARGONIUMS UNSATISFACTORY.**—S. The rooted *Pelargonium* cuttings have been submitted to examination, but we cannot discover that the unsatisfactory condition is due to any fungus, although *Gloeosporium Pelargonii* occurs in a very small degree in one or two of the brown spots. The condition of the young plants suggests that they have been subjected to a very low temperature accompanied by an excess of atmospheric moisture.

264,637.—Kilburne, W. R.—Bee-keepers' appliances.  
258,833.—Soc. Nouvelle Des Etablissements A. Maguin.—Device for the recovery of the radicles and small waste products from Beetroots.

Printed copies of the full Published Specifications may be obtained from the Patent Office, 25, Southampton Buildings, London, W.C.2, at the uniform price of 1/- each.

## Abstract Published.

A novel device recently patented enables plants grown in pots and bowls to be adequately supported without pushing sticks into the mould and breaking up the roots. The inventor is Mr. E. T. Dolton, of 3, Cutliffe Place, Bedford, and the patent No. 263,387. The device consists of a metal base member adapted to be arranged below the surface of the soil and having a tubular member extending from its face to just above the soil to support a stake carrying wires, etc., for securing the flowers. Four spring clips are arranged at intervals to grip the edge of the bowl or pot so that the tallest of plants are maintained perfectly steady.

## THE LATEST TRADE MARKS.

THIS List of Trade Marks, of interest to readers, has been selected from the Official Trade Marks Journal, and is published by permission of the Controller of H.M. Stationery Office.

## WILLIS BROS.' Garden Fertiliser

**THE BEST ON THE MARKET.  
NO STABLE MANURE REQUIRED.**  
For digging in or as a top-dressing. For kitchen  
Gardens or Herbaceous Borders.  
1 cwt., 15/-; 1-cwt., 9/-; 28 lb. 5/-; £14 10/- per  
ton. All Carriage Paid.

**LOOK TO YOUR VINES!**  
The Vine requires a large quantity of Potash for its  
proper growth and the development of fruit. WILLIS  
BROS. VINE MANURE contains 7% Potash, 22%  
Phosphate, and 4% Nitrogen, and the results justify us  
in saying it is the best on the market. The effect on  
old vines is very marked, it puts new life into them.  
1 cwt., 25/-; 56 lb. 14/-; 28 lb. 8/- All Carriage Paid

**LAWN MANURE.**  
Having been connected with the experimental  
manuring of pastures, etc., for over 40 years, we are  
in the position to offer the above with perfect  
confidence as to results. It is especially suitable for  
poor mossy lawns, improving the texture of the grass,  
and helping the lawns to keep their colour in dry seasons.  
Can be used at the rate of 5 cwt. to the acre.  
1 cwt., 20/-; 10 cwt., £9 15/-; 1 ton., £19. Carriage  
Paid. Special Prices quoted for Grass Manures for  
Park Land in quantities.

**LAWN SAND AND DAISY KILLER.**  
This preparation will be found very effective for  
thickening the sward and encouraging the grasses; also  
destroys the daisies and other weeds so troublesome  
on lawns. 1 cwt., 25/-; 10 cwt., £12. Carriage Paid.  
**DIRECTIONS FOR USE.**—Sprinkle thinly over the surface  
of the lawns at the rate of 4 to 6 ozs. to the square yard;  
where a mass of weeds occurs a little more may be used,  
as the grass cannot get through until the weeds are  
killed. A dry day in autumn or spring is the best time  
to apply the LAWN SAND.

**SUSSEX TRUG BASKETS.**  
18" 4/-; 20" 5/-; 23" 6/-; 26" 7/-; 28" 8/-; each.  
Carriage Paid.

**GARDEN SUPPLIES AT LOWEST PRICES.**  
Write for our List of Garden Manures and Horticultural  
Sundries. Free on application.

**WILLIS Bros. (HARPENDEN) Ltd.**  
HARPENDEN, HERTS.

**PRICE 3s. POST FREE**

ONE of the famous "Present-Day  
Gardening" series, edited by the late  
R. Hoper Pearson, containing eight  
lovely coloured plates. Only a few of  
these books now remain, and they are  
not being reprinted, so that the oppor-  
tunity of securing one may not be avail-  
able much longer.

GARDENERS' CHRONICLE, LTD.,  
5, Tavistock Street, Covent  
Garden, London, W.C.2.

## SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## SITUATIONS WANTED

Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this specified rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

### SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter, or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or if received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.

### PRIVATE.

HEAD GARDENER, 3 or more, life experience all branches gained in large establishments; 74 years head; excellent references; abstainer; age 37.—L., c/o Clarke, The Grove, Twyford, Berks.

## IMPORTANT SALE OF ORCHIDS

By Order of the Executors of the late  
Mr. A. J. Hollington.

MESSRS. PROTHEROE &amp; MORRIS

have received instructions to sell by Auction

the well-known collection of Orchids formed and cultivated  
for many years by the late Mr. A. J. Hollington. The  
Collection is a large and important one, comprising nearly  
10,000 PLANTS, the more important items being the  
Cypripediums and Cattleyas, of which large quantities  
were grown for cut flower, in addition to the choicer var-  
ieties. Cattleya species are particularly well represented  
and there are quantities of attractive Cymbidium, Cypri-  
pedium and Cattleya seedlings.

The sale will take place at

THE GARDENS, CLOCK HOUSE,  
FORTY HILL, ENFIELD,

On Monday, March 21st, 1927,

and two following days.

Catalogues from the Auctioneers, Messrs. PROTHEROE &  
MORRIS, 67 & 68, CHEAPSIDE, E.C.2.

# RHODODENDRONS FOR EVERYONE

By **F. KINGDON WARD.**

**PRICE - 3s. 9d. - POST FREE.**

**T**his fascinating work, published in 1926, has already proved exceedingly popular, and is rapidly commending itself to the gardening public, many of whose members are finding how much easier is the cultivation of these delightful flowering shrubs than they had imagined. There are very few gardens where they will not grow and flourish with ordinary, common-sense treatment, and their glorious blossoms are a perpetual feast to the eye. Capt. Kingdon Ward writes with authority, for he knows his subject at first hand, having had seven or eight years' experience of travelling in China and Tibet, where he discovered a number of new Rhododendron species.

Send for a copy to-day, to:

**THE GARDENERS' CHRONICLE, LTD., 5, Tavistock Street, London, W.C. 2.**

**DICENTRA**

(Dielytra).

(Bleeding Heart or Lyre Flower.)

D. Spectabilis is a magnificent plant for the Garden, Greenhouse or Conservatory, rosy-pink flowers, elegant foliage, requires very little attention in the open and it forces easily. Height 2 feet.

6 extra strong plants, 2/6.

# CALENDAR OF GARDEN OPERATIONS

Price 2/6, post free 2/10.

The CALENDAR OF  
GARDEN OPERATIONS  
is indispensable and un-  
rivalled, because it represents  
the accumulated experience of  
over half-a-century. Origin-  
ally compiled by Sir Joseph  
Paxton, it has been re-  
vised and enlarged by the

staff of The Gardeners'  
Chronicle until it is  
now as nearly perfect a  
gardening guide as any that  
exists. Its claim to be a  
"calendar" is undoubted,  
as the work to be done is  
arranged under the heading  
of each month.

THE GARDENERS' CHRONICLE, Ltd., 5, Tavistock Street, London, W.C. 2

# SUTTON'S SEEDS

Some beautiful new flowers for 1927 that every garden lover should try :

GODETIA (illustrated)—	
Sutton's Double Shell-Pink, Sutton's Double Rich Pink, each per packet,	1/6
ASTER—	
Sutton's Giant Anemone-Flowered Pink	2/6 & 1/6
COSMEA—	
Sutton's Early-Flowering Double White, Rose, Crimson	each 1/6
Mixed	2/6 & 1/6
DIMORPHOTHECA—	
Sutton's Lemon Queen	1/6
ESCHSCHOLTZIA—	
Sutton's Orange Prince, Sutton's Enchantress	each 1/-
JACOBIA (single, tall)—	
Sutton's Bright Rose	1/-
SALPIGLOSSIS (large-flowered)—	
Sutton's Light Blue and Gold, Sutton's Velvet Red	each 1/6 & 1/-
SCABIOUS (double large-flowered)—	
Sutton's Coral Gem	2/6
ZINNIA (Giant double)—	
Sutton's Queen of Roses	2/6 & 1/6
Sutton's Art Shades	2/6

## CYCLAMEN

Awarded  
R.H.S. GOLD MEDAL

THE POPULAR GREEN-  
HOUSE PLANT.

The greenhouse Cyclamen now ranks as the King of the winter-flowering pot plants. If you have overlooked the previous opportunity of growing these valuable plants, now is the time to prepare for next winter's display by obtaining seed, seedlings, or plants in 60's. We are still in a position to supply plants in 48's in full flower for immediate decoration, price on application. Ask for a copy of our useful little Treatise. Our Catalogue is the most complete Cyclamen list published—a post card will bring you a copy.

## The MONRO COMBINATION SEED DRILL

*Converted into a Cultivator with one wheel*

With Cultivating Frame - - - - £3 : 17 : 6

Without Cultivating Frame - - - - £3 : 4 : 0

Weight packed 48 lbs. Holds 2½ quarts.

Special attention has been given to this appliance and it has been brought to such a degree of perfection that we cannot commend it too highly.

The function of this Seed Drill is most uniform and its action smooth. It will sow in continuous drills or in groups 4, 6, 8, 12, or 24 inches apart.

It has a very wide roller and the line marker is capable of marking at distances varying between 6 and 20 inches and either to the left or right of the drill.

It can be converted into a Cultivator, with one wheel performing the work of sowing, hoeing and cultivating. Furthermore, it will serve as a plough.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 41.8°.

### ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, March 9, 10 a.m. Bar. 29.6. Temp. 46°. Weather, Sunny.

SCIENCE in its endeavour to discover the reasons for things suffers from several curious disadvantages. The work is necessarily slow, and mankind is apt to be impatient; when one piece of work has been accomplished by science, it becomes part and parcel of the common stock of science—everybody knows it, and those who know least are most surprised that anyone should claim credit for science for having made such a self-evident discovery. Moreover, no sooner has science solved one of its problems than, like so many Richards in the field, others come into view and invite attack. Thus the work of science, like that of a hard-working housemaid, is always being discharged, but never accomplished. It is scarcely possible to read Sir John Russell's fascinating account\* of soil conditions and plant growth without encountering in every chapter illustrations of the last of these reflections. Thus, less than

a century ago, science attacked the problem of the source whence plants obtain supplies of carbon. So late as 1840 it was believed—in spite of good evidence to the contrary—that vegetation derives the vast mass of its carbon compounds from the humus of the soil—for do not plants thrive best in well-manured land? Then Liebig showed that the old discoveries of neglected pioneers of plant physiology are correct, and that the atmosphere is the source of the carbon contained in plants. The humus theory fell into disrepute . . . but science is still engaged in trying to find out whether, after all, plants do not obtain some carbon compounds from the soil, and if so, whether the fact may not be made use of in practice. There is no need, however, for men of science to be unduly apologetic for the slowness of the progress of discovery in agricultural science; a certain modest satisfaction with the results which have been achieved should mark their attitude to their achievements. For truly much stands to their credit. Within a life-time of men not very old, the full story of the marvellous migration of nitrogen through the world of living things has been told; the part played by Leguminous plants in seizing hold of atmospheric nitrogen and bringing it into combination and thereby into use in the plant body and thence to the animal body; the similar part played by the nitrogen-fixing micro-organisms in the soil whereby after other soil organisms have wrought changes of decay on complex nitrogen compounds—residues residing in dead things—the final product, ammonia, is oxidised and nitrates produced in the soil with the result that plants, relieved from the danger of nitrogen starvation, may flourish and having flourished die, bequeathing to the world the nitrogen compounds contained in their bodies. No less interesting at Sir John Russell's hands is the record of the progress which is being made in discovering how the various conditions of soil and climate which affect plants continue to promote, regulate and limit the growth of plants. There are, for example, valuable lessons to be learned by every practical grower in those chapters describing the effects of soil temperature, moisture, aeration, etc., on the growth of plants. For, as indeed the cultivator well knows, unless all these factors are propitious, failure is bound to result. Every gardener sooner or later comes up against instances of one factor limiting the fertility of his soil. It may be lack of water, or too much water in the winter. Whatever it be, until that defect is remedied, it is not possible to increase soil fertility. It is useful therefore to keep in mind the doctrine of limiting factors and for the gardener to apply it by asking himself which of the many possible factors it is that is limiting the growth or fruitfulness of his plants. Any gardener who reads attentively Sir John Russell's account of the behaviour of plants in diverse soil conditions will derive not only advantage, but satisfaction. He will discover why it is that different plants enjoy such different soils. Some, as, for example, Buck Wheat, do not mind if their roots are ill supplied with air; others, like Barley, cannot do without plenty of air at their roots. Willows and Rice can go on growing even though the percentage of oxygen in the soil is as low as 0.5, but Maize and Peas need all and more than all the 21 per cent of oxygen of ordinary air. Who, knowing that, would have the soil about the roots of his Peas other than loose and friable. Of all the advances made by agricultural science during the past twenty years, the most important are probably those which demonstrate the complexity of soil, not only in its physical,

but also in its biological aspect. With the progress of pure chemistry and particularly that concerning the properties of colloids, the study of the soil has entered on a new phase. If, as but rarely happens, any gardener who is engaged day in day out in bringing the soil of a garden into a more perfect and workable condition, has the leisure to peruse Sir John Russell's account of the colloidal properties of clay, he will be in a position to appreciate why it is that soils have such complex and sometimes paradoxical behaviour, and here and there he will get hints which help to explain why attempts to ameliorate soils are not always successful. Like facts, soils, and particularly clay soils, are stubborn things, and that not only to the man who has to work them, but also to him who tries to comprehend their composition. Needless to say, this is not an easy work. Knowledge of soil science is incomplete. Many investigators are in hot pursuit of it. They capture it in detail; but much still eludes them. Therefore, it is not to be expected that the author should give a simple, concise statement of our knowledge. He has done better than that; he has shown us how knowledge is being gained, and the direction in which the search for it is being pursued—a truly masterly work; hard to read, but full of mental nourishment.

### Primulas and Rhododendrons at Kew.

In spite of the more genial weather of the last week, it is still rather too early for the above-mentioned outdoor flowers at Kew. The rosy-flowered Rhododendron mucronulatum is over—though a second flush has swept over some of the bushes, painting them in sharply against the sombre background of dark shrubs in the dell. *R. moupinense* is dying and fading away like a white ghost; and it will be a month yet ere the Primulas and Rhododendrons generally flower on the rock garden. But in the houses some interesting plants may be seen. In the alpine house, for example, *Primula Fortunei* and *P. limnoica* are in full bloom. The former is a small, mauve-flowered Chinese plant prettily powdered with snow-white meal. The flowers are loosely-arranged in a head, and hang down somewhat on fairly long pedicels in a style which at once distinguishes them from the *Denticulata* type. In its effort to hold up its head, the flower is thrust squarely forward, and becomes somewhat prognathous. *P. limnoica* is a pretty Burmese 'Denticulata,' with compact heads of purple flowers, distinguished by a long, blunt, toothed calyx and a still longer corolla tube jutting from it. It is not very mealy, and the meal, such as it is, is pale green. *P. limnoica*, by the way, is wrongly marked as a Tibetan plant, probably because every collector wants to go to Tibet, and, being unable to do so, contents himself with recording every plant which comes from within two hundred miles of the frontier as a Tibetan species! *P. denticulata*, from the Himalaya, a robust species, sending up several flowering stems, is also blooming bravely, but the scapes are still somewhat brief and squat. Two beautiful European species are flowering in the same house, *P. marginata*, with its refined, pale-lilac flowers, and beaded leaves, and the minute, rose-flowered *P. Allionii*. The former is a charming species, just the right size for the lower ledges of the rock garden, refined in every part. The latter, though small, is of so pure a colour as to defy comparison. In the large Temperate House the beautiful hybrid *P. x kewense* is to be seen growing in the Rhododendron beds with a light crimson-flowered *P. obeonica*. The Rhododendrons include *R. lutescens*, which is a very pale, creamy, Chinese *R. triflorum*, and *R. praecox*, a charming cross from *R. dauricum* and *R. fornosum*, with the colour of the former. *R. praecox* is as happy outside as in, and as it flowers when *R. dauricum* and *R. mucronulatum* are over, it is a good plant to possess. Another interesting, though scarcely beautiful hybrid in the Temperate House is a cross between

\* Soil Conditions and Plant Growth, by Sir E. J. Russell. 5th edition. Longmans, Green and Co., 1927. 18/- net.

*R. lutescens* and *R. spinuliferum*. The cream flowers, suffused with the dull red of *R. spinuliferum*, have retained the narrow, tubular shape of the latter unimpaired, though somewhat enlarged. Two *Azaleas* are a mass of blossom in the Temperate House—the bright, sunny, yellow *Anthony Koster*, and the warm, flame-coloured *J. C. Van Thol*. Amongst the hybrids of *Rhododendron javanicum* are two in flower, *Mrs. Heal*, with cream coloured flowers and orange anthers (one plant has white flowers), and *Souvenir de J. H. Mangles*, which has torrid red flowers toned to deep salmon. The next to bloom in this house will be the *Arboreums*; already *R. Delavayi album* has a truss or two out, and so has a purplish Himalayan *R. arboreum*, true. There can be little doubt that the Chinese *R. Delavayi* is at most only a variety of *R. arboreum*; considering the mad surfeit of names in this genus, we should not feel the loss of a few.

**A New Branch of the National Playing Fields Association.**—On Tuesday, March 1, at a meeting held at Wakefield, under the presidency of Sir Edward Brooksbank, Bt., D.L., representing the Lord Lieutenant of the West Riding of Yorkshire, it was decided to form a branch of the National Playing Fields Association. There was a large attendance and many promises of support were made.

**R.H.S. Plant-Collecting Expedition.**—At the Annual Meeting of the Horticultural Club on Tuesday last, Mr. F. J. Chittenden, Director of Wisley Gardens, delivered an address entitled "Some American Impressions," giving experiences of his recent visit to that country as a delegate from the Royal Horticultural Society to the International Conference on Plant Sterility at New York, and at the International Congress of Plant Sciences at Cornell University. In introducing the lecturer, the Chairman, Mr. Gerald Loder, stated that one very interesting result of Mr. Chittenden's trip was that the R.H.S. is arranging a plant-collecting expedition to the Western States of North America on a moderate scale. Mr. Chittenden stated that one rock garden he saw in the Western States contained one hundred or more plants unknown to him. We hope to publish a detailed report of Mr. Chittenden's address in our next issue.

**The Stamperland Orchid Collection.**—Mr. Robert Paterson has purchased a residence at Ardingly, near Haywards Heath, and intends removing his collection of Orchids from Clarkston to his new abode in the South of England in the coming summer. The long distance from Glasgow to London and the time taken in transit is an acknowledged handicap to an exhibitor, and in view of the more convenient position in Sussex it is highly probable that the Stamperland Orchids will be more frequently seen in future at the R.H.S. and other shows held in London.

**Devil's Dyke, Brighton.**—The announcement of the recent sale of this picturesque place recalls the anxiety of the public to save it from the builder in the autumn of 1925, and the successful action taken by various bodies at that time to schedule the British earthworks encircling the Dyke under the Ancient Monuments Act. The Devil's Dyke is some 700 feet above sea-level, and from the highest parts may be seen on clear days the Isle of Wight, the Weald, Windsor Castle, Leith Hill and Box Hill. The purchaser is stated to be a well-known London solicitor and it is believed that the public need have no further anxiety as to the future of the Dyke.

**Dahlias in Public Parks.**—In view of the time for propagating Dahlias it is opportune to remind those responsible for the up-keep of public parks and gardens that no flower gives finer effect in large beds and forefronts of shrubbery borders than Dahlias, and although their season is a comparatively short one, they provide interest at a time of the year when bright flowers are most appreciated. The illustration on p. 179 (Fig. 90) shows a bed of Dahlias in flower in Regent's Park. For several years these plants have been grown very extensively in this London Park, and they seem to do

as well in big towns as in the country. It will be remembered that in our issue for October 16, 1926, we published an account of the Dahlias in the old churchyards at Bermondsey, one of the most densely populated districts of the Metropolis, where they do exceedingly well. The special border illustrated in Fig. 90 includes a great number of varieties, and as the various sorts are of different heights, it is easy to arrange the plants to produce a bold expanse of beautiful flowers.

**Mr. H. Naylor.**—The unique garden that the late Lord Battersea so charmingly designed at The Pleasaunce, Overstrand, Cromer, and still maintained by Lady Battersea in a delightful manner, is fairly well known to east-coast visitors because the owner continues her interest in it and permits the public to inspect it on Sunday afternoons during the holiday season. Last year the gardens were opened on eight Sunday afternoons in August and September and were visited by over 14,500 people; a small charge is made and the proceeds—about £300 in 1926—given to hospitals and charities. Mr. H.

MR. H. NAYLOR.

Naylor, who has charge of the gardens and the care of Lady Battersea's house and grounds, has been gardener at The Pleasaunce for twenty years, and although the sandy nature of the soil is not conducive to the best results, he has, with the assistance of his generous employer, made these gardens rank among the most beautiful in the country. Mr. Naylor's gardening experience commenced in his uncle's nursery at Harrow, whence it was an easy transition to Tring Park, where he remained four years. In due course he filled positions in the gardens of Effingham Hill House, Aldenham House and Stanmore Hall, becoming gardener at Preston Manor, Brighton, and, later, at Piggott Manor, Elstree, and Harrow Weald Park, before going to The Pleasaunce, where he has done splendid work without advertising it.

**New Zoological Park.**—An estate of 400 acres has been acquired by the Zoological Society of London, situated in the Chiltern Hills, in the neighbourhood of Tring and Dunstable, thirty miles from London. This is destined to be used as a country home for animals from the "Zoo," where they will be able to roam at large in surroundings approximating more nearly to their native habitats than is possible in Regent's Park. Included in the scheme, which is estimated to involve an expenditure of £200,000, is the creation of a bird sanctuary, which will be established at once; and preparations are also to be made for the reception in paddocks of animals "on holiday" from London. The larger and harder animals are overcrowded in

their present quarters, and it is the intention of the Society in future to keep only a selection of the animals in London, while the breeding stock and the bulk of the collection will remain in the country. We are glad to learn that it is not intended to spoil the natural beauty of the present site by any visible buildings or walls. The necessary shelters, etc., will be hollowed out of the hillsides and enclosed by natural rock and plants.

**Sugar.**—Some interesting details of Sugar production were given by Mr. Ben H. Morgan in a paper entitled "The Sugar Resources of the British Empire," read before the members of the Royal Society of Arts on the 25th ult. Mr. Morgan stated that the total world Sugar production in 1924-25 was 22,866,000 tons, and of this amount 3,693,000 tons were produced in British possessions, of which British India produced 2,537,000 tons. The world production of Cane Sugar during the years given amounted to 14,701,000 tons, of which the Empire percentage was 25.1. Contrary to common belief, more Cane Sugar than Beet Sugar is produced, the amounts being 14,701,000 and 8,185,000 tons respectively. During the three years for which statistics are available, the annual importation of Sugar into the United Kingdom amounted to nearly 2,000,000 tons, of which seventeen to twenty per cent. came from various parts of the Empire. At the present time the Government is paying a subsidy on Sugar Beet grown in this country, but the subsidy, which is now 19s. 6d. per cwt. will be reduced during the next three years to 13s., and for a further three years to 6s. 6d., when it is the present intention that this subsidy shall then cease. Unless the cost of production can be brought down or the price of Sugar very substantially enhanced, it is by no means certain, said Mr. Morgan, that the industry will be able to continue without the subsidy.

**Advertisements and Open Spaces.**—Kent County Council are creating fresh bye-laws, at the request of many residents in the county, prohibiting the use of advertisement signs which tend to disfigure public parks or pleasure promenades, or spoil views of rural scenery. We trust that this example of public spirit and artistic appreciation will be followed by many other County Councils and similar public authorities.

**International Horticultural Congress, Vienna, 1927.**—The decision of the Bureau for the Arrangement of International Horticultural Congresses (Secretary, Professor Dr. J. M. Sirks, Wageningen, Holland), to hold the next International Horticultural Congress in Vienna, and to entrust the Horticultural Society of Austria with its management, as recorded on p. 77, was taken after the Governments of the States concerned as well as the authorities at the last International Horticultural Congress, Amsterdam, 1923, had been consulted, and in consideration of the fact that the Jubilee festivals in connection with the Centenary of the Horticultural Society of Austria will take place in Vienna. As a result of this resolution the Horticultural Society of Austria is planning a series of festivals and arrangements which will be terminated by the International Horticultural Congress which takes place from September 20 to September 25, 1927. The Secretary-General of the Horticultural Society of Austria is Mr. F. Kratochwil, and the Secretary-General of the Congress, Dr. A. Bretschneider.

**Changes in the Forestry Commission.**—Intense satisfaction is being expressed in Scottish forestry circles over the re-appointment of Sir John Stirling Maxwell to the Forestry Commission. Few, indeed have given closer study to the subject than he, and great regret was expressed when, two years ago, Sir John ceased to be a member of the Commission, as then constituted. We have only to look back upon the fine work he has done for many years as member and Chairman of the Royal Scottish Arboricultural Society to realise the importance and the sanity of the choice now made. But there is another gentleman whose name would be warmly welcomed as a member of the Commission by those interested in affores-

tation in the North of Scotland. We refer to Mr. Sydney James Gammell, of Countesswells, Aberdeenshire. There are few, if any, landowners—or for the matter of that, skilled foresters—who know more about forestry than Mr. Gammell. For years he has been making elaborate experiments on his estates, from which many interesting and informative lessons have been adduced. We hope the time will come, and that very soon, when Mr. Gammell will take his seat on a Commission which would be ever so much the better for his vast knowledge and ripe experience in this important subject.

**New Varieties of Potatoes Immune from Wart Disease.**—The Ministry of Agriculture and Fisheries has approved the following new varieties of Potatoes as immune from Wart Disease: Aberdeen Favourite, Argyll Favourite, Cardinal, Doon Star, Duke of Perth, Earlyfield, Glencoe, Herald, Hopeful, and Macbeth's Castle. A complete list of the names of the varieties of Potatoes officially approved as immune from Wart Disease may be obtained on application to the Offices of the Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W.1.

on April 14, and return from the Hook of Holland by the night steamer on April 20. The itinerary includes the Hague, Scheveningen, Leyden, Haarlem, Amsterdam and the Zuyder Zee, where Monnickendam, Maarken and Volendam will be visited. The cost of the tour is twelve-and-a-half guineas. Mr. F. Beal, and Mr. C. W. Hester will accompany the party and act as guides.

**Cobaea scandens in a Public Hall.**—The subject illustrated in Fig. 85 is worthy of note as being one of the most vigorous ornamental climbers grown. Introduced to this country from Mexico over a century-and-a-quarter ago, this extraordinary climber always appeals to plant lovers, and now that municipalities are constructing well-lighted and ventilated halls and winter gardens, *Cobaea scandens* may be grown in many of them, especially those with a glass roof. Such structures lend themselves to decorative displays and the ornamental iron girders may be clothed with beauty. The photograph of Alexandra Hall, Weymouth, from which the illustration is reproduced was taken last autumn when myriads of the flowers were open. Not only are these bell-shaped flowers beautiful,

**Appointments for the Ensuing Week.**—**MONDAY, MARCH 14:** United Horticultural Benefit and Provident Society's annual meeting; Guildford and District Gardeners' Association's meeting. **TUESDAY, MARCH 15:** Winchester Horticultural Society's meeting. **WEDNESDAY, MARCH 16:** Royal Gardeners' Orphan Fund meeting. **THURSDAY, MARCH 17:** Wallington Horticultural Society's lecture. **FRIDAY, MARCH 18:** Manchester and North of England Orchid Society's meeting. **SATURDAY, MARCH 19:** Royal Norfolk Agricultural Association's exhibition.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—**Cheap Protection for Wall Trees.**—Being desirous of affording my Peach and Nectarine trees some protection, and disliking the unsightly wooden poles generally used for keeping the covering material off the trees, for wood I have substituted iron, which I think will last longer and answer the purpose better, besides being far less conspicuous. My plan is to drive pieces of iron into the wall for stays, the top ones being two inches from the wall, the middle ones three inches, and the bottom ones four inches. Through these I pass iron rods quarter-an-

FIG. 85.—COBAEA SCANDENS, ON THE ROOF OF THE ALEXANDRA HALL, WEYMOUTH.

**Forestry Degree at Aberdeen University.**—The Senatus Academicus of Aberdeen University has decided to recommend the following additional regulations dealing with the degree in forestry: That forestry students should be required to take forest chemistry in the forestry department under the lecturer in forest chemistry; in place of a course in agricultural chemistry; that students for the degree of B.Sc. in Forestry be required to take a course in meteorology from a forestry point of view; that the candidates for the degree in diploma, forestry, be required to take the pre-registration course in physics and chemistry, before attending the course in physics, chemistry and geology in relation to the soil. Intimation has also been made that a course in forestry surveying, specially adapted for forestry students, has been arranged.

**Horticulturists' Easter Tour in Holland.**—The officials of the Brighton, Hove and Sussex Horticultural Society are arranging an Easter tour in Holland on behalf of members and friends—a holiday that will be both interesting and educative. The party will leave Harwich, via London,

but when cut with long sprays they last a long time in water. The Alexandra Hall, in the gardens of the Borough of Weymouth and Melcombe Regis, was opened in March, 1923. It is provided with abundant light and warmth, and ample ventilation when necessary. Due advantage was taken when the foundations of the building were levelled up, to prepare the soil thoroughly against the walls inside where the *Cobaeas* were planted. This initial preparation was the secret of success and ensured the marvellous growth attained in so short a period. The dimensions of the hall are 100 feet by 100 feet. *Cobaeas*, growing from north to south, furnish the girders, the spiral, spring-like tendrils keeping the growths in position in a graceful fashion. *Cobaea scandens* is not hardy, and frost should not be allowed to penetrate any winter garden where it is grown. A note of warning is permissible; as the seed-pods are large and fairly heavy, they should be removed at any early stage where the *Cobaea* is trained above the audience. The foliage of *Cobaea scandens* is a healthy green colour, and invariably free from insect pests—a matter of considerable importance in a public hall

inch in diameter, which are drawn tight by means of nuts at either end of the rods. My blinds consist of very coarse canvas, which is two-and-a-half feet wide. It is cut into the required lengths, and four pieces are sewn together. This forms a blind ten feet wide; it is tacked on to a lath the same length, one-and-a-quarter inch wide by three-quarters-inch thick. The iron stays at the top of the wall are turned up one inch at the ends, where the laths lay; two of the wires pass through the laths, which are thus kept firmly in their places. The bottom of the blind is provided with a very thin piece of wood, similar in shape to that used at the bottom of window blinds. A pulley is fixed into the wall at the top in the centre of each blind, and by means of a piece of string all can be raised or lowered in a few minutes. *Edgar Sanders, Kingswood Lodge, Gard. Chron., March 13, 1852.*

**Publication Received.**—*Varieties of Oats, 1926.* Department of Agriculture, University College of North Wales, Memorial Buildings, Bangor, from whom copies may be obtained, free of charge.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Thunias.**—These Orchids should be repotted as they start into growth and before the new shoots commence to push forth roots. A suitable compost consists of a mixture of half peat and half loam, from which all the fine particles have been removed, with some Sphagnum-moss and dried cow manure, and sufficient coarse sand or broken crocks to render the compost open and porous. The pots should be well-drained, as during their season of growth these Orchids require an abundant supply of water at the roots. They may be grown singly in pots or several together, but in no case should they be crowded. The strong-growing *T. Marshalliae*, and the hybrids from it, such as *T. Veitchiana*, should be afforded more pot room than the small growers, such as *T. Bensoniae*, and its variety, *T. Winniana*. The plants should be placed in the lightest position in the warmest house, where they should remain until the flower buds appear. Water should be given the roots sparingly until the flowers appear at the apex of the new growths, as, if applied too liberally, there is a danger of the plants making long, vigorous growths, and producing no flowers. When the buds are formed and the pots filled with roots the plants should receive water copiously and a little liquid manure occasionally until the flowers are about to open. During bright, sunny weather the plants should be syringed frequently to prevent attacks of red spider, which will infest them if the conditions are at all dry.

**Pleiones.**—Some little time after the different species of these most interesting plants have flowered, they should be repotted, that is to say, placed in shallow pans in a compost consisting of good fibrous loam, A.I. fibre and peat fibre, cut into rather short portions and with all the earthy particles removed; these materials should be mixed with live Sphagnum-moss and sufficient fine crocks to render the compost open. Care must be taken not to break the new roots or the young growths. After repotting the plants they should be placed in a humid position near the roof-glass in a house having an intermediate temperature. Water should be supplied to the roots sparingly until they have entered the new material freely. Whilst the plants are in full growth, the treatment recommended for *Thunias*, as regards watering, is suitable also for *Pleiones*.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTREE, Hornley Hall, Greatford, N. Wales.

**Cauliflowers.**—Young Cauliflower plants raised from seeds sown last August and wintered in cold frames, may, if hardened thoroughly, be planted on a warm, sheltered border, the soil of which should have been well-prepared previously, and enriched with a moderate amount of well-rotted manure. For this early planting, I advise drawing fairly deep drills, so as to give slight protection to the young plants. The trenches may be filled with soil by means of the Dutch hoe later, when the Cauliflowers commence to grow freely. When setting out the plants, lift and plant them carefully with a trowel; afterwards place a little soot around the stems to protect the plants from slugs. The rows should be about thirty inches apart, and a distance of eighteen inches allowed between the plants in the rows. The variety Early London is very reliable for this crop, its hardiness having been well proved.

**Salads.**—Seeds of Lettuces, both Cabbage and Cos varieties, may now be sown out-of-doors on a warm border. Radishes should also be

sown in a similar position. Turnip-rooted varieties being the most suitable for an early supply. Lamb's Lettuce or Corn Salad should also be sown to provide variety, as well as Mustard and Cress, the two last being best sown for the present in a warm frame, or house. Maintain a supply of well-bleached Chicory and Endive so long as possible. Keep an eye on late Celery, and should the plants show signs of bolting, lift and store them in a dark, cool shed.

**Potatoes.**—A few rows of early Potatoes may be planted in a warm position where protection can be given when necessary.

**Leeks.**—Seeds of Leeks may be sown now on a warm border out-of-doors. This batch will follow that sown earlier, inside. Other sowings may be made for successional cropping so late as May to provide a supply until June of the following year.

**Brassicas.**—Make the first sowings of Cauliflowers, Brussels Sprouts, Broccoli, Cabbages and Savoys on a well-prepared seed-bed, on a warm border, out-of-doors. Net the beds as soon as the seeds are sown, using a small-meshed netting, or finches and linnets will attack the seedlings. When the latter appear, dust them occasionally with old soot, and thin them before they become crowded.

**Globe Beet.**—Should frames be available, a sowing of Globe Beet may be made. Thin the young plants early and remove the lights from the frames whenever possible, as they are only needed to protect the plants from very cold winds and frost. Guard against sparrows, which will attack the young leaves.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brocket Hall, Hertfordshire.

**Chrysanthemums.**—Plants raised from cuttings to produce large blooms will now be ready for shifting into larger receptacles. The stronger-growing varieties may be transferred to six-inch pots, while those of a weaker constitution may be grown in fifty-four sized pots. The compost may consist of good fibrous loam, which should not be chopped too finely, manure from an old Mushroom-bed, bone-meal and sand. Store the compost in a dry, open shed so that when used it can be made moderately firm by ramming. The receptacles and crocks should be washed thoroughly and allowed to dry before being used. After potting the plants place them in cold frames, but some provision must be made to cover the frames at night in cold, frosty weather. The frames should be kept fairly close for a few days, after which the lights may be removed entirely whenever the outside conditions are favourable. Decorative and single varieties that were rooted last month may now be transferred singly to sixty-sized pots; the soil for this potting may be somewhat similar to that recommended for the large-bloomed varieties, but it should be first passed through a coarse sieve. Late varieties may still be propagated to produce flowers as late in the season as possible. Old stools that have been retained to produce cuttings for raising stock to grow in six-inch pots should be kept free from insect pests.

**Begonias and Gloxinias.**—Seedlings of tuberous and fibrous-rooted Begonias raised from seeds sown in January should be carefully pricked off while still small, into a light compost, which may consist of equal parts of fine peat and loam that have been passed through a fine sieve, with a liberal sprinkling of silver sand. The compost should be watered freely the day previous to transplanting the seedlings. Do not discard the smaller seedlings, for in many cases these often produce the best coloured plants. Gloxinia seedlings will need the same treatment. Rooted tubers of these plants should be started into growth in batches as required, using a light, open compost of fibrous loam, peat or leaf-soil, with crushed charcoal and sand added. The tubers may be started in shallow boxes, allowing sufficient space for the leaves to develop.

When they are sufficiently advanced they may be transferred direct to their flowering pots, or, as an alternative, they may be placed in small receptacles and potted on as required. Careful watering is necessary at this stage, but when the roots are established in the new soil they will need a liberal amount of moisture. A moist atmosphere is required to promote quick growth; shade the plants from bright sunshine.

### HARDY FRUIT GARDEN.

By H. MARKEHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Newly-planted Trees.**—Whenever the soil is in a suitable condition, examine freshly-planted trees, also those which were root-lifted, pruned and replanted last autumn, and tread the soil firmly about the roots. Prune and train the branches at equal distances apart, after which prick up the soil to the depth of two inches to prevent it from becoming baked in dry weather, and apply a mulch of strawy manure.

**Standards.**—Newly-planted standard trees in orchards should be staked securely and the stems protected against sheep, rabbits and hares, if necessary. When fastening the trees to stakes, use some soft material to prevent the bark from chafing in windy weather.

**Bush Trees.**—Where there is not sufficient head-room for the extension of the main branches of tall standards, bushes may be planted in their stead. With well-chosen varieties planted in good soil, a quick return on outlay is attainable from Apples and Pears. The young trees should be pruned very carefully to form neat, well-balanced heads. Suitable shoots should be selected at equal distances apart, and these should be shortened more or less according to their length and strength each year, always cutting to a bud pointing to the outside of the tree. All young growths in the inner part of the tree should be pruned to a couple of buds. Examine the bushes about midsummer, and cut back young shoots which are likely to overcrowd the tree, to within five or six leaves at the base of each. Others that may be too thickly placed, or that cross each other, should be removed entirely. Bush trees should be set twelve feet or more apart, and if planted by the sides of paths, Currant or Gooseberry bushes may be interplanted until the Apple trees attain a good size. In all gardens where there is room, a few young trees of suitable varieties should be purchased annually, planted and grown on for a few seasons for filling gaps, and to take the place of old, worn-out trees. These young trees will yield good crops at once after they are lifted and transplanted, resulting in a great saving of time. Varieties of Apples are numerous and should be carefully selected to give a long supply of fruits. Useful dessert varieties are Beauty of Bath, Irish Peach, Ellison's Orange, Worcester Pearmain, Egremont Russet, Wealthy, Cox's Orange Pippin, Allington Pippin, Ribston Pippin, Laxton's Superb, Mannington Pearmain, Adams's Pearmain and May Queen. Cooking: Lord Derby, Stone's Apple, The Queen, Bismarck, Bramley's Seedling, Crawley Beauty, Lord Grosvenor, Lane's Prince Albert, Chelmsford Wonder, Sandringham and Annie Elizabeth.

### THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic  
Gardens, Kew.

**Climbers and Shrubs on Walls.**—Now that all danger from prolonged spells of severe frost is past, any necessary pruning of climbers and shrubs of a more or less tender nature that are used for furnishing walls may be undertaken. If such plants are properly managed, there should be little or no pruning to do at this time, in fact, they should be so managed that at no time should it be necessary to resort to drastic pruning and thinning; by this I mean they should be kept regularly within bounds, allowing shrubby plants to develop and furnish the space available.

In pruning flowering climbers and shrubs the time for the operation will depend on whether the plant flowers on the old or new wood; for example, *Prunus triloba* var. pl. fl., which is a beautiful flowering plant for a wall, flowers on the wood of the previous year, and should therefore be pruned hard back so soon as it has finished flowering, to allow it plenty of time to make and mature its new shoots for the following season. The young growths should be left their full length, and not trained in, except such as are required for extension. I instance this plant in particular, as I have often seen all the flowering wood cut away during the autumn or winter. In pruning, all the main branches and such shoots as are necessary to retain should be made secure to the wall; keep a sharp watch for ties that are getting too tight.

**General Remarks.**—The edging, remaking and repairing of garden paths should be completed so soon as possible. Where mixed border flowers are situated next to lawns, it adds much to the general effect if the border is edged with stones and about a foot of gravel; or the front may be paved. This allows the front line of plants to grow out in an informal manner, adding greatly to the general effect.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**The Orchard House.**—Peach and Nectarine trees that were started into growth at the beginning of the year have passed the flowering stage, and if the fruits have set freely the remains of the flowers may be washed off by the syringe. Thinning the fruits and disbudding the shoots should then be done; the removal of gross, fore-right shoots should be carried out over a period until two or three fruits pointing upwards on each shoot remain, and two good growths are left, one at the base, the other at the top to draw up the sap and furnish the tree with bearing wood for another year. All intermediate shoots may be rubbed off in due course, but for some little time close pinching is the safest course, especially where there is a fruit. The application of rich top-dressings to the roots is a very important matter, as it is impossible for pot trees to mature a good crop of fruits without this assistance. The top-dressing should be supplied little and often from the time the fruit sets to its attainment of full size. Feed the roots also with diluted liquid manure when the stoning period is reached. The shoots may be pinched at about the fifth leaf, more or less, according to the size of the trees and the space at command. Daily cultural details include regular and careful watering with tepid water, damping all available spaces and light overhead syringing when the weather is bright and fine. The temperature of the house should not exceed 55° at night, and 65° to 70° by day for the present, with air admitted when the sun is shining. If fermenting material has been used, this should be turned regularly and renovated to ensure a steady bottom-heat, which should not be strong, as gentle warmth will suffice to keep the roots active. As later trees approach this stage, the house should be fumigated moderately on two or three occasions, as neglect of this is sure to end in trouble, especially if Strawberries are grown in the house. So soon as the flowers open, direct syringing should be discontinued, but atmospheric moisture must be maintained, especially on bright days. The temperature through this stage may range from 50° to 55° at night, and 60° to 65° by day or up to 70° when the sun favours liberal ventilation.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF  
AILMA, Culzean Castle, Maybole, Ayrshire.

**Kitchen Garden.**—So soon as the ground is in good working order, the earliest crops, such as Jerusalem Artichokes, Onion sets, and Shallots should be planted; while it is advantageous to get these crops planted early, it should not be attempted while the soil is in an unsuitable condition, as ground, if trodden on whilst

it is wet will become hard and require to be again broken up with the digging fork. These remarks apply also, and with more force, to the early sowing of seeds. At the first opportunity, however, when conditions are propitious every effort should be made to make the first outside sowings of such vegetables as Peas, Broad Beans, Parsnips, Spinach and Onions.

**Fig and Peach Trees.**—Where these tender fruits are grown on outside walls, the work of pruning and training the branches should be completed. The flower-buds on Peach trees develop early, and much damage may result

**Early-flowering Chrysanthemums.**—The propagating of a sufficient number of these plants should be done forthwith. If the cuttings are inserted about three inches apart in boxes filled with a sandy compost, they will not require transplanting before the time arrives, early in May, for transferring them to their flowering quarters. The house or frame in which they are placed should be kept close and shaded from direct sunshine for the first week or two, in order that the cuttings do not wilt, as if once this happens hardening of the tissues sets in, and the rooting process is very much delayed, if not prevented altogether. So soon,

FIG. 86.—*SALIX CINEREA* VAR. *MEDEMII*

(see p. 176).

if these are too far advanced before the shoots are fastened securely. The older wood should, in both cases, be removed where it can be dispensed with, leaving plenty of young shoots to furnish the vacant spaces. These young shoots should have ample room between them, so that, if necessary, the current year's shoots, which should always be selected from near the bases of last year's growths, may be laid in temporarily between them as growth proceeds. Young trees of both kinds are inclined to grow too vigorously at the expense of fruiting, and this must be rectified by root-pruning in autumn in the case of Peach trees, and confining the roots of Fig trees so that their rooting area is much restricted.

however, as it becomes evident that the cuttings are rooted, air should be admitted to the house or frame on all favourable occasions, and the shading removed entirely. Late-flowering Chrysanthemums may also be propagated now, if it is desired to grow on a number in small pots for obtaining useful plants for house decoration, and on the side stages in the greenhouse. The earlier-rooted plants should be transferred to larger receptacles before they become pot-bound, and grown on under cool conditions. Spray them with an insecticide or fumigate them on the first appearance of insect pests. Admit air whenever the weather is favourable for this to be done, to obtain stocky, sturdy specimens.

## BULB GARDEN.

### MONTBRETIAS.

EXPERIENCE has taught me that it is a decided advantage to lift corms of Montbretias in autumn, store them in sand in a frost-proof shed, and replant them in spring, when the ground is in a favourable condition for working. They should be inserted six inches apart and three inches deep, in sufficiently large quantities to form attractive groups when in flower.

The choicer kinds are best grown in three-inch pots in sandy loam, and started in a cold frame,

FIG. 87.—*LILIUM PHILIPPINENSE FORMOSANUM*,  
FLOWERING TEN MONTHS FROM SEED-SOWING.  
(see p. 177).

to be planted afterwards at a greater distance apart than the older kinds. There is a large number of varieties of which the Westwick hybrids are some of the best of recent introductions, including the superb Star of the East, which has orange-yellow flowers.

### GLADIOLI.

THESE popular bulbous flowers are excellent subjects for summer bedding, and lend themselves for this purpose in an endless number of ways. Being of upright growth, it is easy to associate them with other plants.

A border or bed devoted to Paeonies may be made bright through the summer and autumn by planting Gladioli in the open spaces; the same practice may be followed with Iris beds. The Gladioli are useful for associating with Carnations in beds or borders. They are also invaluable for adding colour to and filling bare spaces in herbaceous borders. None is so useful for this purpose as the well-known *G. brenchleyensis*, which produces its spikes of bright scarlet flowers in profusion.

A rich, deep loam of medium texture is the most suitable in which to grow Gladioli, but they will thrive in almost any garden soil. A heavy, retentive soil may be made suitable for them by being well-worked and having plenty of burnt refuse and the remains of a spent hot-bed added. Very light soil should be dug deeply and mixed with a liberal amount of decayed cow manure. If possible, the ground should

be dug and manured in the autumn; then, in the spring, it will only be necessary to move the surface soil with a fork preparatory to planting the bulbs.

Early in April is usually considered the best time for planting Gladioli, but if a succession of flowers is desired until late in the autumn, planting may be done at intervals until June.

To obtain spikes for exhibition purposes, Gladioli are best grown in rows made eighteen inches apart on well-prepared beds, allowing twelve inches between the corms in the rows, which should be planted to the depth of three inches. During the growing season a mulching of short manure will promote strong growth, and applications of liquid manure, given after the spikes appear, will greatly assist in the production of fine inflorescences which should be supported by neat stakes as they develop. The practice of lifting the corms in the autumn should be rigidly followed, as this enables the ground to be worked to better advantage.  
*James A. Paice.*

## TREES AND SHRUBS.

### *SALIX CINEREA* VAR. *MEDEMII*.

EACH succeeding year the value and beauty of this Willow as an attractive flowering tree or large shrub appears more marked. Not only is it the earliest of the Willows to attract attention, but the catkins are among the largest and most showy of the genus. This year, in common with most early-flowering subjects, the catkins

develop on the same catkin. As a garden subject, *S. c. Medemii* is very distinct from the Grey Willow, *S. cinerea*, of which it is considered a variety, with its larger leaves and bigger, more attractive catkins. These are up to two inches long and three-quarters-of-an-inch thick.

Trained in a young state to a single lead, the species assumes the character of a small tree, while by pruning, large, shapely bushes develop with twigs freely clothed with catkins in early spring. In common with other Willows, *S. c. Medemii* is readily propagated by cuttings, one foot or more in length, inserted out-of-doors during November. *A. O.*

## FLORISTS' FLOWERS.

### OUT-DOOR CHRYSANTHEMUMS.

THE hardy, early-flowering varieties of Chrysanthemums are most valuable for providing a display of colour in the garden from early autumn onwards, as well as for furnishing cut blooms for floral decoration indoors. They are easily raised from cuttings, which may be inserted at this time of the year under glass, and they will root very readily in cool conditions. It is preferable to dibble the cuttings in shallow boxes filled with a gritty compost and to re-box the plants before they become drawn. With proper attention, the cuttings will be suitable for setting out in the garden from the end of April onwards. Planting in late April or the beginning of May has its advantages

FIG. 88.—CONTORTED *NARCISSUS TAZETTA*, AS GROWN BY  
THE CHINESE.  
(see p. 177).

are two to three weeks later than usual in developing. In most seasons attention is drawn to the trees at the end of January by the developed catkins, but this year we were past the middle of February ere they became attractive. Now, on March 5, the rich yellow stamens are fully developed and very showy.

The great majority of Willows are dioecious, but in *S. cinerea* var. *Medemii* (Fig. 86) we have a most interesting exception, as occasionally pistillate and staminate organs of the flower

and disadvantages, for whilst it is unlikely that there will be drought at that early season, there may be a risk of frost. However, it is necessary that the roots should grow away freely, and when the plants do this, without a check from drought, it has a great bearing on the earliness of the blooming. The plants should be grown in an open situation and allowed ample space to develop; a distance of eighteen inches to two feet should be allowed between them, according to the strength of the variety.

# A Wonderful Service for owners of **ATCO** ALL BRITISH MOTOR MOWERS

A chain of ATCO Service Depots ensures that every ATCO Motor Mower is retained in perfect condition for all time. Each Depot is fully equipped and staffed with competent ATCO Engineers who can undertake every kind of repair, adjustment and replacement at minimum cost and with least possible delay and advise on all matters of maintenance. A post card to the nearest ATCO Service Depot—the address of which will be found on your ATCO Mower—will receive immediate attention.

Catalogue and particulars of ATCO Motor Mowers for from £8 down on application to:

SEEDSMEN BY APPOINTMENT

## LAWNS & WEEDS

All lawns should be reconditioned immediately if the turf and surface are to be in good condition for the coming season, consequently preparations should be made in advance, and all the required materials — Grass Seed, Fertiliser, Worm Killer, etc., assembled. For particulars how to renovate your lawn, make a new lawn, diagrams and instructions, send for Carters Booklet on "Lawns and Weeds"

**Carters**  
TESTED SEEDS

Grass Seed and Turf Specialists  
RAYNES PARK, LONDON, S.W. 20

### SERVICE AND ADVICE

Carters will answer any question in regard to the improvement or upkeep of your Turf.

## Stephens' Outdoor Ink

A NEW INK for writing with ordinary pens on SHINY SURFACES. Writings made with it on many METALS, on CELLULOID, PAINTED WOOD, etc., are unfading and waterproof. On glass they are unfading but not waterproof.

### For Garden Labels

etc., which have to stand exposure OUT-OF-DOORS it is the most serviceable Ink.

Indelible pencil writings "run"; other fluids fade or dissolve in the rain unless protected by glass slides, etc. STEPHENS' OUTDOOR INK neither runs nor fades.

Sold only in 6d. Bottles by Seedsmen, Stationers, &c., or post free 9d. from

The out-door Chrysanthemum will flourish in almost any kind of soil, but much the best results are obtained on land that has been well-tilled and manured previously. During the plants' season of active growth, they should be watered liberally in dry weather and the roots fed with stimulants when the flower buds are swelling. When each variety is allowed to assume its natural habit, the plant will usually be not only of well-balanced shape, but produce sprays of bloom the more abundantly; that is, in comparison with one which has had its point removed. In a general way, however, it will be found that the side branches which arise near the central flower bud will not grow so long as those an inch or two lower down. It is well, therefore, to experiment in this direction, for length of flower stem is important. Not only is this so, but with the centre of the plant removed, the remaining stems will grow up straighter.

The thinning of the shoots should be done so soon as these are large enough to handle, and the secondary growths on the selected shoots may also be removed as they appear, whether the number to be retained on a plant be a dozen, four, or so few as three; and one central stick, with the stems laced loosely to it is usually sufficient to support the plant.

The following are twelve first-rate varieties which will expand their flowers before the majority are in bloom. Their early-flowering makes them useful for bedding, and their growth rarely exceeds thirty inches in height. Thinned to one flower to each side stem, these varieties would, of course provide flowers of enhanced size, yet this section of Chrysanthemum is best adapted for producing a wealth of spray-like blossoms.

Goacher's Crimson is a variety that has furnished a bronze and a so-called golden form; all are excellent, but require good cultivation. Polly also requires to be grown in well-prepared ground, and there are golden and crimson forms of it. Dick Barnes gives distinct wine-coloured flowers. Mrs. Jack Pearson is of varying shades of bronze-yellow; this is a variety by itself, inasmuch as the blooms may be cut with capital stems and successional flowers will follow quickly. A deep-coloured form named Mrs. Phil Page is a valuable addition. Normandie is about the best pink as Rio des Blanc is the best white; but in each case there is room for improvement. Phoenix, with bronzy red blooms, is a remarkably fine spray variety of recent introduction.

Referring to varieties for producing sprays of bloom, the undermentioned sorts follow the above in time of flowering and these, therefore, require some kind of protection from wet, and may be, from frost. The time the flowers open depends considerably on earliness or otherwise of planting, as well as the nature of the ground and the situation. September and early November is the time when they are at their best.

Almirante, a bronzy-red sort, and its variation named Alcalde or Red Almirante, are amongst the most useful of this shade; Cranford, rich yellow; Cranford Cream, Framfield White, as well as its creamy-coloured form; Hollicot Yellow, which is probably the best yellow among the early sorts, has a distinct amber-yellow form in Harvester; Lichfield Peach, which is popular on account of its delicate colouring, and Mayford White for the superb quality of its blooms. Perle Chatillonnaise in a tall variety esteemed for its cream and pink flowers, a rather nice variation being J. Bannister. Pink Profusion is an excellent variety; the salmon form is a pretty and quite distinct shade. Hollicot Bronze is a good sort with bronze-yellow flowers.

There are large numbers of varieties which will produce big blooms when the growth is thinned and each branch allowed but one flower. This is a very beautiful section of the Chrysanthemum, but the plants need some protection, such as a cool greenhouse or canvas shelter. They include Early Buttercup, yellow, as well as its bronze form; Cranford Yellow, a very fine sort; Cranford Pink; Cranfordia, yellow, also with a bronze sport; Crimson Circle, a fine red sort; Elvenham White, Framfield White, and its

cream form; Hollicot Yellow, the best early yellow variety; Harvester, a flower of amber colour; Le Pactole, a fine red and bronzy-yellow sort, and Mayford White.

In Mrs. R. Hamilton we have a brilliant yellow; Pink Delight is distinct in its delicate colouring; Pink Profusion also is excellent, as is its salmon-coloured form; R. A. Roots, is a new and choice white variety; Sanctity also is white; Hollicot Bronze, bronzy-yellow; September White, which produces large blooms, and Uxbridge Pink, of which there are bronze and other variations, are also to be recommended.

So far double-flowered kinds have been considered. The single forms apparently lag behind, or may be these do not appeal to me so much. They include Chieftain, a crimson variety; Doreen Woolman, orange; Delice, rose-pink; Firebrand, crimson, with a form of it termed Golden Firebrand. John Woolman, rose-pink colour; Midnight Sun, bright terracotta; Nathalie, old rose; Salmonea, salmon-pink shades; Supreme, yellow; Shrapnel, orange, and Water Witch, white. *H. Shoesmith, Woking.*

FIG. 89.—EURYALE FEROX IN THE BOTANIC GARDENS, TOKYO.

## INTERESTING PLANTS AT TOKYO.

I HAVE pleasure in sending you a little information concerning some interesting plants in the Botanic Gardens at Tokyo. Your readers may consider the illustration of *Lilium philippinense* var. *formosanum* (Fig. 87) represents a poor specimen, but the plant was only ten months old when it flowered. Seeds were sown on December 15, 1925, and the photograph was taken on September 7, 1926. I have heard of *Lilium longiflorum* flowering within one year (strictly nine months) from seed sowing, in California; in my experience this is an easy matter. Moreover, if the stem is cut the next stem appears soon after, and if well treated it is possible to obtain flowers twice in the same year from the same bulb.

My friend, Mr. Sudzuki, Omori, near Tokyo, collected *L. philippinense* var. *formosanum* in Formosa some years ago, and as it flowered in his own garden within the year he recommended it to me. The specimen illustrated was in a four-inch pot and one foot high.

The Victoria regia is the most famous tropical aquatic plant in the world, but we have another

fine one in *Euryale ferox*. The popular Japanese name of this is Oni-basn (Oni=Demon; basn or hasn=Lotus, i.e., Gigantic Lotus) or Ibara-basn (Ibara=Wild Rose, the reference being to the spines). The *Euryale* has huge, round leaves that sometimes attain 76 inches to 108 inches, but ordinarily, 24 inches to 36 inches. It is the only serious rival to the Victoria regia, but the *Euryale* does not need to be grown in a tropical house, indeed it rather likes a cold climate, as shown by its development in the north part of Japan and north Korea, the upper part of Ussuri, China and Bengal. The leaf is round, dark green above, spiny and purple beneath. The leaf stalk is also prickly. A full description of *E. ferox* is given in *Bot. Mag.*, t. 1, 447. At Tokyo it is a magnificent sight grown in a pond which has some Gunneras along one side. The flowers are rather small and continue only for three days. The fruits are armed with prickles and contain small, hard, round (50-120) seeds that are toasted and eaten by the Chinese and Japanese. In China they are said to be used in medicine. The seeds germinate after two years; the first leaf is ovate-oblong, the next sagitate, and then

follow the circular leaves. Fig. 89 represents *E. ferox* in our gardens on September 22, 1926, when the largest leaf was two feet in diameter.

The Chinese cultivate Narcissi of the Tazetta type very extensively, in bowls or pans of water, but the plants they grow are very different in appearance to those commonly seen, as shown by the illustration in Fig. 88. All the leaves are abnormal, curving and covering the bulb, the flower stem alone growing straight. This curious abnormality is produced by cutting a small portion from the centre of the bulb while the latter is dormant, or by making a small cut down the middle, but in either case the cut must not damage the young bud. If the knife touches any portion of the incipient flower stalk, the latter will be curved in the same way as are the leaves. The bulbs so treated are placed side by side on stones in the pans of water, and after a few weeks the leaves appear and curve downward, as shown. The Chinese call this the "Crab culture" method, and suggest that the curved leaves resemble the claws of a crab and the bulbs the body, while the flowers are crab's eyes on long, projecting stalks. *M. Matsuzaki, Botanic Gardens, Tokyo.*

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notices printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## DISEASES OF LILIES.

IN a paper read at the R.H.S. Conference on Lilies, in London, in 1901,\* Mr. George Massee referred to forty-five varieties of fungi as known to grow on Lilies in different parts of the world, and was happily able to add the comforting assurance that many of them were rare and many apparently harmless to their hosts. Of fungi destructive to Lilies in Britain, Massee indicated only three, and pointed out that every now and then, when climatic and other conditions are favourable, these fungi manifest themselves in the form of an irrepressible wave of disease. The fungi in question are *Botrytis cinerea*, *Uromyces Erythronii* and *Rhizopus necans*, and of the trio the first is infinitely more prevalent and more destructive than the others; it is the only one, too, which as yet is known to have assumed an epidemic character in Britain.

*Uromyces Erythronii* is one of a large genus of rust fungi of which mycologists recognise about forty species, and as its name implies, the particular species is primarily associated with the leaves of *Erythronium*. It is not confined to that genus, however, and according to Massee, attacks the foliage of *Allium*, *Fritillaria*, *Lilium*, *Muscari* and *Scilla*. The writer has noticed it also on *Calochortus* and *Trillium*. This *Uromyces* is said to be common on the Continent and in North America, but has not so far hampered growers of Lilies much in this country. The disease appears on the leaves in spring in the form of clusters of yellow pimples, visible to keen-eyed folk, but easily overlooked; later on, these pimples develop into cups, which, when examined through a magnifying glass, are seen to be filled with a powdery, brownish-red rust, really a mass of spores. In the final stage the winter spores appear as tiny brown spots on the decaying leaves, which fall to the ground, where some spores may remain dormant till the spring, and then, obeying the universal influence, may infect young leaves, so that the cycle of life begins anew. The spores are in the crust of the ground, not in the bulb, and it follows that if rusty leaves are gathered before they fall, and burned, or if the infected soil is skimmed off, the fungus is not likely to be disseminated.

*Rhizopus necans*, originally identified by Massee,† is a fungus found in the bulbs of

Lilies exported from Japan, and so far as the writer is aware, has not obtained a footing in this country. It takes the form of a brown, cheesy condition at the base of the bulb, and though sometimes so obvious in bulbs taken out of the packing case in which they have come from Yokohama that it cannot be overlooked, may easily pass unnoticed by those not familiar with it. A slight darkening of the flesh about the roots of a bulb is often the only external evidence of the fungus, and then investigation with a penknife may show that a fair exterior covers a foul heart; the blade of the knife may slip in up to the hilt and much of the inside of the bulb can be scooped out as a mass of ripe Medlar-like material, leaving what, in effect, is an empty shell. In such a case the bulb is useless, but where the fungus has not gone so far as to destroy all the basal flesh from which the roots spring, and has not eaten its way into the heart of the bulb, all decayed matter should be cut away and then, the bulb inverted, the basal depression may be filled with a solution of carbolic acid, one part, to forty parts of water. This may be allowed to remain for half-an-hour, and so soon as the bulb is dry, powdered charcoal should be dusted on to the affected parts. Cooke\* found that by steeping the bulbs for twenty minutes in a one per cent. solution of either corrosive sublimate or salicylic acid, all spores of the fungus reached by the liquid were killed.

The incidence of this fungus seems to depend on the weather at the time the bulbs are harvested in Japanese bulb gardens, and packed for export, and after a wet, cheerless autumn the percentage of diseased bulbs may be comparatively high; on the other hand, in a favourable year, when the bulbs are well ripened, whole cases may come to hand without a trace of the fungus. Until the point has been determined by controlled experiment it will not be possible to say that under certain circumstances, *Rhizopus necans* may not attack the healthy tissue of established bulbs in British gardens, but experiments the writer made in 1908-1910 in planting sound bulbs in ground previously occupied by diseased bulbs, tends to show that there is considerable doubt about it.

If a bulb of *Lilium auratum* infected with *Rhizopus necans* is planted in the ground or in a pot, the fungus gives evidence of its presence by an unmistakable distortion and dwarfing of the stem, noticeable soon after the latter has appeared through the ground in spring. The stem may or may not have strength enough to support any leaves, but if it has, they usually wither and fall away before many weeks have elapsed.

The early history of *Botrytis cinerea*, or Grey Mould, in this country in lost in obscurity, and though the parasitic disease of Lilies (and other plants) called "spot" was not identified as *Botrytis* till 1888, it is tolerably safe to regard the fungus as of old standing. As *La Maladie de la Toile* it has been known in France for a long time; it seems to have a wide range in Europe and in the United States of America mycologists have been familiar with it for many years. According to Kean,† it is the fungus which in the early 'nineties put an end to the thriving trade carried on for some years in bulbs of *L. longiflorum*, between Bermuda, where they were cultivated as a field crop, and the United States and Great Britain.‡ The fungus does not seem to have attracted serious attention in connection with Lilies in this country until about 1880, when references to it as "spot" began to find their way into horticultural journals of the time, chiefly in relation to *L. candidum*; and though mycology was then a comparatively neglected branch of scientific study, and it was the general custom to regard plant diseases as visitations from Providence, and so more or less inevitable, the fungus can hardly have been seriously destructive before then or more attention would have been directed to it. At any rate, it is certain that at that time there were many gardens where *Botrytis* on Lilies was unknown, or unnoticed, and within his own limited experience, the writer remembers its

first appearance in his garden as well as in several other places towards the end of last and the beginning of the present century.

The rapidity with which the disease spread and has continued to spread through the country seems to show that it can scarcely have been epidemic here on Lilies much before the 'eighties, but there can hardly be any truth in the story current about twenty-five years ago that *Botrytis cinerea* reached this country from the United States as a disease of Lettuce. On the other hand, the grip it has on *L. candidum* may possibly have originated in diseased bulbs of that species sent here from France, whence large numbers of bulbs have for long been imported. In 1893 the mycologists, Prillieux and Delacroix, who were asked to advise about an epidemic of *Botrytis cinerea* which ravaged the market gardens in the neighbourhood of Fontainebleau, found the disease most acute on *Begonia*, *Alternanthera*, *Echeveria* and Lettuce. Curiously enough, they reported that in the vineyards of Sauterne as well as in those of the Rhine country, wine-growers regarded *Botrytis* as having a favourable effect on the ripening of the Grapes and on the quality of the vintage. According to these authors, there was an epidemic of the fungus on *Gentian* in the Jura in 1888.\* It is difficult to account for its presence in Bermuda, except on the assumption that it is universal, though it may have been conveyed to the islands in bulbs sent to the islands from Japan. Once launched on the sea of speculation however, there is no end to the theories that may be evolved on the origin of the fungus here, and the fact remains that no one knows whether it came as a disease of Lilies or of other plants. It has a far wider range than is generally supposed, and has been found on other plants, including Gooseberry bushes, green Figs,† and vines; even, too, on the Douglas Fir.‡ In fact, in a serious epidemic it is difficult to say what plants it will not attack.

When Elwes was preparing his *Monograph of the Genus Lilium* in 1879, he had his first experience of the serious ravages of which *Botrytis* is capable, and described it in the following words:—"A fungoid disease, resembling what is called 'spot' in Orchids, is often observed to attack the leaves of Japanese Lilies in wet, cold weather, and is, I have no doubt, caused by want of warmth . . . . Since the preceding was written, we have experienced in England one of the most protracted and severe winters followed by one of the coldest and wettest summers ever known; and the results have been disastrous to Lilies. My own losses have been so great that I have almost despaired of replacing them . . . . Perhaps the most remarkable case was that of a long bed of Californian Lilies, mostly varieties of *L. californicum*. These had become perfectly established in large clumps, and came up in the spring with unusual strength. After they had grown five or six feet high, and in most cases produced numerous buds, they became covered with blotches of decay, which spread rapidly over the whole plant. Week after week of dull or sunless weather had apparently induced a somewhat similar disease to that which destroyed the Potato crops so generally in 1879, and the result was that they died off either without flowering or with only a few half-opened buds."

Mr. Elwes sent a parcel of these diseased stems to the Rev. M. J. Berkeley, scientific adviser to the R.H.S., and he reported as follows:—" . . . . Nothing, however, has ever equalled, as regards condition, what we have now before us. The disease is no longer confined to mere spotting, but affects the whole plant, extending even to the bulb which will soon be in as deplorable a state as the plant itself. No Potato stem affected with the *Peronospora* was ever in a worse state than what we have before us . . . . No treatment or change of soil seemed to have any beneficial effect."

At that time the fungus, which had not been

† *Kew Bull. Misc. Inf.*, 122-123, 1897, p. 87.

identified, was known simply as "spot," and, in *The Gardeners' Chronicle* of September 10, 1881, there was printed a letter from the Rev. C. Wolley-Dod, of Malpas Hall, Cheshire, a well-known amateur gardener of the last generation, describing what he called "the worst attack of spot which has ever come under my notice." This attack coincided with a break in the weather, which, "for the last fortnight has been very wet and stormy, with great variations of temperature—high winds, cold nights, now and then hot sun, or thunderstorms." To gardeners, and especially to amateurs, of Lilies, the tale of disaster unfolded by Mr. Wolley-Dod is a pitiable one with which, unhappily, they are all too familiar. "*Lilium auratum* (he wrote), which has hardly begun to flower out-of-doors, has suffered most; but no species, even the earliest-flowering, has been exempt from the attack . . . which seems to come suddenly and to attack healthy and unhealthy plants without distinc-

occasional references in horticultural journals to the disease, and in the issue of *Gard. Chron.* for August 18, 1888, Mr. W. G. Smith suggested that Berkeley's identification of the fungus was wrong and that it should be referred to *Peronospora*. In the same year, Marshall Ward, then Professor of Botany at Cooper's Hill College, published a brilliant exposition of the life history of the fungus as he found it on *L. candidum* in his garden at Staines. Ward's interest in the disease had been aroused by the deplorable state of these Madonna Lilies in 1886 and 1888—the latter an especially bad year, for in his own words, "of 258 flowering stems with 1,200 flower buds on them, only ten per cent. were presentable." Ward recognised the fungus as one of the *Botrytis* genus, but did not feel justified in assigning it to a particular species, and it remained for Massée, who had had the fungus under observation for several years, to recognise it as *Botrytis cinerea*.\*

Ward approached the disease from the angle

## LILIES.

WITH the turn of the year the annual consignments of Lilies begin to arrive from Japan, and wholesale buyers and large growers are then busily arranging their season's stocks. Prices average higher than usual, while with regard to the popular *Lilium auratum*, in particular, there is evidence of a distinct shortage. The reason for this is not far to seek. The astute Japanese growers, anticipating that the coal strike would create glasshouse fuel shortage and consequent short demand, have diverted supplies to other countries more favourably situated. At Messrs. Protheroe and Morris's sale room, on December 30 last, over three hundred thousand *Liliums* were disposed of at high prices in less than an hour-and-a-half. This gives some indication of the demand in Great Britain for these bulbs. Why do we depend upon Japan for Lilies? British growers, and a very large

FIG. 90.—A BORDER OF DAHLIAS IN REGENTS PARK.

(see p. 172.)

tion . . . I cannot find that any kind has entirely escaped."

Mr. Wolley-Dod sent specimens of diseased plants to the R.H.S., and not recognising the disease as *Botrytis*, Berkeley reported that it was due to a parasitic fungus of the *Ovularia* genus, to which he gave the new name *O. elliptica*.

In a later issue of *The Gardeners' Chronicle*,\* Mr. Wolley-Dod made what at that time was an intelligent prognosis of the way the disease was spread. "The spores of the fungus which cause the disease are either carried up from the soil with the young growth of the stem of the Lily or brought from a distance in the air." Subsequently,† Mr. George Wilson, a famous amateur of Lilies of his day, and, incidentally, then owner of Wisley, wrote to *The Gardeners' Chronicle* to the effect that though there was no sign of "spot" on his Lilies on August 12, it reigned supreme only three weeks later.

For some years afterwards there were

of scientific research, and made no suggestions as to preventive or remedial measures, but Massée proposed both. "Assuming (he wrote) we have a bulb free from *Botrytis*, it is only fair to suppose that the mycelium of the fungus is present in the soil. To guard against infection, make a hole in the soil three or four times the size of the bulb, fill it with quartz sand in which a dessert-spoonful of sulphur has been mixed, and plant the bulb in the middle of the sand. By adopting this method we practically prevent the formation of sclerotia on the bulb as mycelium cannot pass through sand owing to lack of food . . . . The surface soil covering bulbs should be removed every autumn and replaced by soil mixed with kainit, which destroys fungus mycelium. For the same reason, manure used for mulching should be mixed with kainit, which practically sterilises it." A. Grove.

(To be concluded.)

body of workers engaged in producing flowers for market, apparently depend upon sources of supply entirely outside their control. New Zealand grows some of the finest bulbs in the world, but apart from such distant growing grounds, there does not appear to be any good reason why Great Britain should not supply the bulk of the Lilies sold in the home market, and also add to this a considerable export trade. Already there are indications that this subject is attracting the attention it deserves. Messrs. Wallace and Co., Messrs. Barr and Sons, Mr. Amos Perry and the late Mrs. Backhouse (to mention but a few of the pioneers) have shown the way, and proved that British Lily-growing and hybridisation is both possible and profitable.

The first principle of Lily culture is the recognition of the fact that root-action is fundamentally different from that of other bulbs, such as Narcissus and Tulips. With these latter the roots develop annually from the base of the bulb; consequently such bulbs suffer no harm when they are lifted during their resting

\* Sept. 17, 1881, p. 378.  
† Oct. 1, 1881, p. 442.

\* R.H.S. Jour., July 16, 1901, p. 374.

period. With Liliiums the facts are materially different. They, unlike those already mentioned have not a hard, testaceous skin intended for the purpose of retaining the bulb's natural moisture when the annual roots have died away. The narrow scales of Lily bulbs are arranged loosely, they are fleshy and unprotected, and on exposure to air they rapidly shrivel and lose their vitality. The plain inference is that Lily roots are intended to function continuously and provide a constant supply of moisture throughout the year.

Under the best of circumstances Lilies do not appreciate disturbance; in the case of some species and all old bulbs, moving them is frequently fatal. When, in addition to disturbance, all the roots are sheared off, and the bulbs not only dried up but kept out of the ground for several months, it is scarcely surprising that, lacking roots, the mutilated bulb structures frequently fail to re-establish themselves.

The very existence of stem-roots indicate that the bulbs themselves are not intended by Nature to provide all the nutriment for the superstructure. In this lies the explanation why imported bulbs frequently produce a good flower-spike for the first season and then collapse. The bulbs provide the germ of growth; the stem roots (if present) re-inforce this action, and build up the flowering stem. If such roots are not produced (or being produced are allowed to remain above ground), the stem is liable to collapse before it attains full growth. At the end of the year there is little or no bulb for the following season, by reason of the fact that the perennial basal roots, by which the new bulb should have been produced and nourished, do not exist, having been obligingly sheared off by the Japanese exporter in the interests of future business.

Those who wish to establish imported Lilies in permanent positions (as apart from growers who only desire flowers, or an effect for a single season), would do well to bear the above in mind and arrange their culture accordingly. Lilies dislike manure, but for the most part revel in peat or leaf-mould and decayed vegetable matter. Seedling plants take to such material naturally and establish themselves quickly, but in the case of mature bulbs the first consideration should be the stimulation of new basal roots. The dry bulb is not given a fair chance if it is planted in cold, wet soil. It will, in all probability, throw its energies into the flower stem in a desperate final attempt to reproduce its species, and then expire.

A method which I have found remarkably effective is as follows:—Remove the soil for a depth of two feet and fill with well-trodden, freshly-fallen leaves mixed with grass cuttings and moist vegetable refuse. This forms a mild hot-bed which stimulates root-action while the weather is yet cold enough to deter top growth. In addition, it keeps the situation well-drained, which is important. Cover the leaves with about three inches of fine soil and on this place the bulb. Before planting, the dry bulb should be soaked in water for twelve hours or until the scales have become plump and brittle. This will stimulate the production of roots. It is a good plan to dust the bulb thoroughly with flowers of sulphur while it is still wet. This will effectively check and prevent fungous growth. The bulb, when planted, should be covered with fine, dry soil to the depth of at least twice its own height. Exception to this rule should be made in the case of *L. candidum* and *L. giganteum*, which do best with the nose of the bulb only just below the surface. The bulb should be protected from excessive dampness of soil by an upturned box or pot until such time as the stem appears above ground. Until this point the surrounding soil should be kept as dry as possible. In the case of pot plants the bottom-heat principle may be followed with advantage, but as wet soil is to be avoided until growth is visible and overdry conditions are equally to be guarded against, the ideal method is to plunge the pot in a hot-bed in the open. Where a hot-bed is not available, pot up the bulbs and leave them in a cold frame, free from frost, until growth appears; on no account should top growth be stimulated until root-action has commenced.

Young bulbs (the smaller and cheaper grades of a given variety) are more easily established than larger ones, but the first year's flower yield will be correspondingly less. On no account should bulbs which are soft or of questionable soundness at the base be planted. Such bulbs will only bring and spread disease.

Reverting to the question of British cultivation from a commercial standpoint, there are many localities eminently suited for the purpose. Some degree of shelter and equable climatic conditions, such as are to be found in Dorset, Devon and Cornwall, Southern Ireland and parts of Wales and Scotland, are ideal. In general, the principle to be followed is raising from seed in pots or pans in the open, transferring the seedlings without a check to prepared positions at the end of the second year, and selling the crop at the end of the third or fourth year, in the case of such kinds as *L. regale*, *L. auratum*, *L. speciosum*, etc. *L. regale* is a Lily with a wide future before it; it may be raised to flowering size from seed within two years. This Lily frequently produces abundant flowers in the open border during its second year, if it is properly attended to. *Herbert G. Longford, Abingdon, Berkshire.*

## ECONOMIC PLANTS OF THE BAY ISLANDS (HONDURAS).

(Continued from p. 133).

### VEGETABLES.

#### SWEET POTATO.

Two varieties are found in the Bay Islands, one bearing white or yellow, and the other one purplish tubers. The former has round or cordate leaves, which are simple, while those of the latter are divided into three leaflets. The purple tubers are those preferred locally.

The Sweet Potato is propagated by means of cuttings from the stem, about a foot in length, which are buried half their length in the ground, about two feet apart. In about four months the tubers will have matured. After the latter have been dug up, the stems and roots are covered, and in about two months a new crop comes to maturity. In rich, moist soil this process may be repeated several times.

#### SQUASH.

The Ayote, Pumpkin or Squash (*Cucurbita Pepo*) is represented by many varieties, differing in size, shape and taste. The English speaking inhabitants of the Bay Islands do not cultivate this plant so extensively as do the Ladinios. When tender, the Pumpkin is eaten as a vegetable and generally served in soups. When matured it is generally baked and prepared with sugar or syrup. The native varieties do not reach such large size as those cultivated in the United States.

#### TOMATO.

The Tomato or Tomate (*Lycopersicum esculentum*), is generally used locally to flavour stews. It prospers readily without any care and may occasionally be found growing wild in the neighbourhood of houses, but the fruits do not reach a great size. Many varieties are grown, differing in size, shape, colour and flavour.

Other vegetables, cultivated to a very limited extent in the Bay Islands, are the following: Watermelons, Muskmelons, Asparagus, Egg-plants (locally Plant Eggs), Potatoes, Cabbage, Lettuce, Beet, Onion, Garlic, etc. Owing to the moistness of the atmosphere these products are, however, inferior in size and quality to those raised in more northerly latitudes, and the bulk of these foodstuffs consumed in the Bay Islands are imported from the United States. Fairly good results can be obtained by importing fresh seeds every year as all these plants soon degenerate in the tropical lowlands.

#### COCONUT PALM.

The Coco Palm or Cocotero (*Cocos nucifera*) is a particularly useful Palm found all along the coasts of tropical America, where it has probably been introduced by means of ocean currents. We have no proof of its existence in the New

World in pre-Columbian times, and the Indians of Central America have no native name for it. In the Bay Islands Coconuts are the chief source of income, the annual production exceeding ten million nuts. A dense fringe of Coco Palms extends round all the islands and they prosper even on the limestone or "iron-bound" shore, while all the cays are covered with them. They are also cultivated extensively in the interior of the islands, but they thrive best along the sea shore where the influence of the sea breeze is much greater. The Coconut groves are known as Cocales among the Ladinios, and by the names Coconut Walks or Coconut Gardens by the English-speaking natives. Plantains and Bananas are often raised between the Coco Palms, or the whole grove is planted in grass and used as a pasture. Cattle must however, be kept away from the young trees as they will bite off the tender leaves and kill them.

During the first years of the twentieth century a disease appeared among the Coco Palms, particularly in Utila, and to some extent in Ruatan, while, so far, Bonacca Island has practically been spared this trouble. The bud of the tree begins to rot and the upper leaves become yellow and drop off; at this stage the Coconut beetle or rhinoceros beetle can be found in the heart of the Palm. This is a large, black beetle belonging to the Scarabaeidae. It is not known whether this insect causes the disease or whether it lays its eggs only in the bud of such trees as are already diseased. In Utila, I saw, in 1921, hundreds of trees killed by this trouble, which a few years previously were in full bearing. Rats will occasionally ascend the Palms and spoil the Nuts by boring a hole in them.

None of the by-products of this useful plant are exported from the Bay Islands. No use is made of the wood of the old trees, which takes a good polish and is commercially known as Porcupine Wood. The husk of the nut is not used locally for any purpose, but from the Pacific Islands the fibre or coir is exported to Europe and to the United States and made into cordage, brushes, brooms, matting and ropes. The distillation of arrack from the sap of the Palm, which is practised in the East Indies, is also entirely unknown here. A fermented beverage is sometimes made by the Ladinios from the sap in the same manner as they obtain Coyol and Corozo wine. In the homes of the poorer negroes the shell of the nut is sometimes used as a drinking vessel or for storing different small objects.

Formerly, Coconuts were also exported to England via Belize (British Honduras) in the shape of copra, which is the sun-dried kernel. In England the oil was pressed out and made into soap, candles, Coconut butter, etc. This soap has the advantage of producing lather in salt water, which is not the case with ordinary soap. Coconut milk is locally much used for boiling vegetables, Rice, etc., and the water of young nuts is a very agreeable, refreshing beverage. The oil extracted from the nuts is extensively used in the native kitchens, where it replaces lard. It is also sometimes made use of for lighting purposes; boiling the grated kernel in water and skimming the oil as it appears on the top. It is not exported, but small quantities are sold on the mainland of Honduras, where it realises from 25 to 37½ cents. per pint bottle. About three nuts are required to produce a pint of oil. The Ladinios do not care much for the use of Coconuts in cookery except in the making of dulces or sweetmeats.

For the gathering of the Coconuts the Bay Islanders make use of a sort of pack basket, called basquito, which is made from a small Palm growing in the Cayman Islands, whence they obtain the material. The nuts are collected into heaps, and then the thick, heavy husk is removed with the aid of a pointed, hard-wood stick which is driven firmly into the ground with the point upwards. Grasping the Coconut in both hands the husk is then pierced and easily removed, and by this method an experienced person will husk over one thousand nuts in a day. The nuts are then stored in so-called Coconut-houses until ready for shipment. These houses are built on hard-wood posts

## GLADIOLI

**G** This is the best month for planting the large-flowered Gladioli. They are indispensable for herbaceous borders as they occupy but little space and may be planted near spring-flowering plants in order to introduce magnificent colour and form, into what would be otherwise bare spaces during late summer and autumn. Gladioli are also very effective when planted among shrubs, and being cheap and imposing will produce a finer display than most plants for a moderate outlay.

Another good plant for the present time is *Hyacinthus candicans*, a stately flower for shrubbery or border or Lavender bed.

## WILLIS BROS.' Garden Fertiliser

THE BEST ON THE MARKET.  
NO STABLE MANURE REQUIRED.  
For digging in or as a top-dressing. For kitchen  
Gardens or Herbaceous Borders.  
1 cwt., 15/-; 1/2-cwt., 9/-; 28 lb. 5/-; £14 10/- per  
ton. All Carriage Paid.

LOOK TO YOUR VINES!  
The Vine requires a large quantity of Potash for its  
proper growth and the development of fruit. WILLIS  
BROS. VINE MANURE contains 7% Potash, 22%  
Phosphate, and 4% Nitrogen, and the results justify us  
in saying it is the best on the market. The effect on  
old vines is very marked, it puts new life into them.  
1 cwt., 25/-; 56 lb. 14/-; 28 lb. 8/- All Carriage Paid

LAWN MANURE.  
Having been connected with the experimental  
manuring of pastures, etc., for over 40 years, we are  
in the position to offer the above with perfect  
confidence as to results. It is especially suitable for  
poor mossy lawns, improving the texture of the grass,  
and helping the lawns to keep their colour in dry seasons.  
Can be used at the rate of 5 cwt. to the acre.  
1 cwt., 20/-; 10 cwt., £9 15/-; 1 ton., £19. Carriage  
Paid. Special Prices quoted for Grass Manures for  
Park Land in quantities.

LAWN SAND AND DAISY KILLER.  
This preparation will be found very effective for  
thickening the sward and encouraging the grasses; also  
destroys the daisies and other weeds so troublesome  
on lawns. 1 cwt., 25/-; 10 cwt., £12. Carriage Paid.  
DIRECTIONS FOR USE.—Sprinkle thinly over the surface  
of the lawns at the rate of 4 to 6 ozs. to the square yard;  
where a mass of weeds occurs a little more may be used,  
as the grass cannot get through until the weeds are  
killed. A dry day in autumn or spring is the best time  
to apply the LAWN SAND.

SUSSEX TRUG BASKETS.  
18" 4/-; 20" 5/-; 23" 6/-; 26" 7/-; 28" 8/-; each.  
Carriage Paid.

out in the sea in order to keep the rats away, and at the same time facilitate transportation to the vessel by means of large canoes or lighters. Generally, the nuts are taken in local schooners to Key West or Tampa (Florida), or in Banana steamers to New Orleans, New York or Boston. Around 1918 and 1919, Coconuts yielded locally as much as \$62.50 per thousand, but at the time of my last visit there (1921) the price had fallen to \$10.00. This barely paid for the expenses involved in the gathering, husking and storing of the nuts, and consequently a great depression reigned in the Bay Islands at the time.

#### COHUNE PALM.

The Cohune or Menaca Palm—Corozo in Spanish—(*Attalea Cohune*), is found in all the islands, especially in fertile areas but, gradually, as more land is being brought under cultivation, the Cohune Palm is disappearing. It is found from sea-level to an altitude of about 600 feet (180m.). Entire forests of these trees exist on the Atlantic coast of Central America, from Black River (Republic of Honduras) to Yucatan.

The long, pinnate leaves are the most common thatching material for the houses of the poorer natives in this part of Central America; if

for two to four weeks, during which time large specimens will have yielded from ten to fifteen, and even more, gallons of *Vino de Corozo*. The natives of the Bay Islands do not seem to know how to make this wine, but the Ladinos are very expert at it. The hole wherein the juice collects must be well covered in order to keep insects out; the black rhinoceros beetle particularly likes to feed on the bud of the tree. *Edouard Conzelmus*, 33, Boulevard des Batignolles, Paris.

(To be continued.)

### ALPINE GARDEN.

#### SAXIFRAGA BURSERIANA TRIDENTINA.

The seedlings illustrated (Fig. 91) are from *Saxifraga Burseriana tridentina*, which is a native of the Trentino Alps. A few years ago we raised a batch of seedlings from this variety and in no case were there two alike; either the foliage was distinct, or the shape, size or form of the flowers showed variation. The plant on

tion for a long time. It is a most delightful little plant and forms masses of neat foliage, which at first is woolly in appearance, but afterwards becomes of a pleasing green. The plant sends out runners, which root as they extend, and so assist in increasing the size of the original specimen to a remarkable degree. The hairy flower stems rise to a height of about six inches and bear pretty pink flowers, resembling those of *Verbenas*. This *Androsace* is not difficult in a sunny, sandy place in the rock garden or moraine, where it will flourish and give increasing pleasure as it extends. Propagation may be effected by taking off the rooted runners, which may also be pegged down if desired. There are several varieties, but as these are not generally offered for sale, with the exception of the fine variety *Chumbyi*, they may be dismissed with a brief mention. The others include *A. s. yunnanensis*, a very small form from Yunnan, and *A. s. Watkinsii*, another miniature variety.

*A. sarmentosa* and its varieties range in their native distribution from the Himalayas into China. Plants may be purchased in pots and planted out at any time, or, if desired, they may be raised from seeds, but seed-raising should not

FIG. 91.—SEEDLINGS OF *SAXIFRAGA BURSERIANA TRIDENTINA*.

properly made, such a roof will last for five years without repairing. A Cohune Palm produces annually from one to four bunches of fruits, each containing several hundred nuts of the shape of a small fowl's egg. The fruit consists of a very hard shell which surrounds an oily kernel. The oil is occasionally extracted and used as a substitute for Coconut oil. On account of the extremely hard shell it is very difficult to split the nut. In the green state it contains an agreeable, refreshing liquid which is somewhat purging. During the war the shell was exported to the United States to be used in the manufacture of gas masks.

From the sap of this tree a sort of wine is obtained which is, however, not as highly esteemed as that from the Coyol Palm. For this purpose the tree is cut down and a small oblong hole is made at the bud just below the crown of leaves. The sap of the tree will then secrete in this hollow which, within two days, will be filled with a fermented, slightly yellowish liquid, the so-called wine, which may become strong and very intoxicating. This fermented juice will be collected once, or even twice, a day, and each time the hollow is made slightly larger. This business may be carried on

the left had flower stems three inches high, and the one on the right, two inches; this last plant also had the largest flowers. Seedlings of *S. B. tridentina* produce large flowers on both tall and short plants, and the foliage shows similar diversity. Small Orchid pans suit these floriferous specimens for frame and cold-house culture, as free drainage is essential for these heavily encrusted types, and ensures free flowering. The size of the pan on the right is three inches; on the left, four inches.

The foliage in each case is large and stiff, the tips of each leaf being almost spiny, while the rosettes are much more silvery than in *S. Burseriana*. It is frequently stated that *S. B. tridentina* is the parent of the large types of *S. Burseriana*, such as *S. B. Gloria*, and our seedlings would seem to verify this statement. *Mark Mills*.

#### ANDROSACE SARMENTOSA.

ANDROSACES are general favourites with growers of rock plants, and it is much to be regretted that considerable numbers of the species are difficult to cultivate.

One of the most accommodating is *Androsace sarmentosa*, a species which has been in cultiva-

tion for a long time. It is a most delightful little plant and forms masses of neat foliage, which at first is woolly in appearance, but afterwards becomes of a pleasing green. The plant sends out runners, which root as they extend, and so assist in increasing the size of the original specimen to a remarkable degree. The hairy flower stems rise to a height of about six inches and bear pretty pink flowers, resembling those of *Verbenas*. This *Androsace* is not difficult in a sunny, sandy place in the rock garden or moraine, where it will flourish and give increasing pleasure as it extends. Propagation may be effected by taking off the rooted runners, which may also be pegged down if desired. There are several varieties, but as these are not generally offered for sale, with the exception of the fine variety *Chumbyi*, they may be dismissed with a brief mention. The others include *A. s. yunnanensis*, a very small form from Yunnan, and *A. s. Watkinsii*, another miniature variety.

#### PHYTEUMA ORBICULARE.

*PHYTEUMA orbiculare* is not so choice as *P. comosum* or a few other Rampions, but it is easy to cultivate, will grow almost anywhere in the rock garden, and is suitable for the front of the herbaceous border. It is not a rare plant, but vastly more attractive and interesting than many subjects commonly grown, while the success and ease with which it may be cultivated is a great asset.

This *Phyteuma* may be raised from seeds, and large plants may be divided with safety in autumn or spring. It is said to be a lime-lover but, in my experience, does not like this material in the soil, and will grow well in light, sandy loam. Its height, according to some, is six inches, but others record it as a foot high; with me it has been always about a foot in height. The plant forms a low tuft of foliage, and from this arise bare stems carrying balls of blue flowers of a deep tone. I suggest this plant as suitable for the border or average rock garden. *S. Arnott*.

## NOTICES OF BOOKS.

**A Year in My Flower Garden.\***

THERE be, it has been said, books of three sorts—books to be purchased, books to be read, and books to be read and kept. That being so, the present reviewer, with a long and varied experience of gardening and its literature, confesses to an inability to classify *A Year in My Flower Garden*.

It is an ambitious octavo volume of over two hundred pages, and its author's aim has been to "give cultural hints, month by month, or period by period, as the case may be, so that the amateur gardener will have no difficulty in caring for his plants throughout the whole year, and carrying them on to adorn the garden once again when the days begin to lengthen and the bursting bud assures us that spring is coming." A worthy aim, in truth, but its successful end demands experience, and a practical knowledge of the many plants and their requirements.

Early in the book the discerning reader, and all really keen amateur gardeners are discerning, will experience doubt as to the qualifications and ability of the mentor, and such information as that "*Arbutus unedo*, *Choisya ternata*, *Erica*, *Kalmia latifolia*, *Olearia Haastii*, *Pernettya mucronata* and *Yucca*" are non-flowering evergreens, will bid him pause, and undoubtedly disagree. Nor will the knowledgeable amateur agree that "Soot, crushed bones, native guano, wood-ashes and poultry manure" are classed as chemical manures.

If, as is perhaps unlikely, the amateur delves further, he will be entertained to find *Virginia creeper* and *Ivy* included with subjects requiring "special" culture. If, again, he has already grown *Violets* in frames, he certainly will not follow the advice given among the operations for the first half of December, to water the plants liberally, "even in cold weather."

Such instances as the above, indicating a deplorable lack of even an elementary acquaintance of gardening, might be multiplied. Such drawings as those on pages 9, 105, 159 and 169 likewise betray the author.

The printers and publishers have done their part of the book well, but the author was not happy in his choice of illustrations. From the title of the book one would, not unreasonably, expect to see pictures of the garden as worked or controlled by the author. But it is not so. The illustrations are of sundry and various types of garden, but few, if any, are calculated to inspire the reader to copy or adapt for his own enjoyment. Generally, their captions are their better part, though not always, and at times they are not precisely descriptive of the illustration. Facing page 112 there is a travesty of a hardy flower border, with a raw, rustic-work erection in the middle distance, entitled, "The kitchen garden may be rendered beautiful if the borders be planted with flowers." I am at one with the sentiment, but abhor the representation. A small clump of *Lilium candidum* flowering at the foot of each widely-spaced pergola pillar, in another illustration, scarcely suggests "growing in profusion." A. C. B.

**Gardens for Town and Suburb.†**

As its title indicates, this is a book intended for the delectation of the town dweller, and deals with the quite small garden.

While Miss Solly informs the reader, in her preface, that "It is not a handy guide to horticulture guaranteed to lead the novice by the hand without slip or falter, through every rite of the garden calendar," she has interspersed her pleasantly discursive book with useful hints and suggestions.

The reading matter treats mostly with garden design and making. There are many excellently reproduced half-tone illustrations of existing gardens, but they are mostly architects' gardens, and, as such, are composed of expensive materials and the living, growing plants play a very

minor part in the schemes. The frontispiece is a coloured view of the sunken garden at Kennington Palace, and this is not so happy—the greens of the formal hedge, grass and plant foliage are overcast with a sickly yellow.

Considerable care has evidently been expended on the lists of trees, shrubs and plants recommended, which well show what a great and pleasant variety may be grown within the confines of most suburban areas, and even in the towns themselves.

We should scarcely have chosen the dead black linen covers with yellow paper labels for the book, but we have nothing but praise for the quality of the paper and type.

## LEGAL NUISANCES.

THE Law of Nuisance is not a subject which on first consideration would appear to be of vital importance to the gardener. He does not "make great noises to the annoyance of his neighbours," nor does he generally allow his chimney to emit poisonous and noxious fumes to the danger of the health of the district, nevertheless the subject of nuisances is of vital importance to all gardeners, for a man may create a nuisance by his manure heap, for which the law will give his neighbours certain remedies, or his trees may constitute a certain form of nuisance for which legal redress is obtainable, while on the other hand, he himself may be able to obtain legal aid to prevent a neighbouring factory from damaging his crops with fumes from their chimney.

## NUISANCES GENERALLY.

Private nuisances, for the redress of which a civil action can be taken, and as distinguished from those nuisances which effect the general public, and for the redress of which proceedings are usually taken in the Police Court, are divided into two classes (i) the wrongful disturbance of rights connected with land, and (ii) the act of wrongfully causing or permitting the escape of deleterious things on to another person's property (e.g., fumes, smells, smoke). The mere fact, however, that such things are allowed to escape does not of itself give rise to an action; in order that a right of action may lie the nuisance must be such that the ordinary man could not be expected to tolerate it, or else the complaining party must show that it has caused some loss to him, for no man is bound to prevent the escape from his land of things which do no harm.

Thus no action will lie against a man who allows the branches of his trees to overhang his neighbour's premises, or their roots to grow under his neighbour's soil unless they are the cause of actual damage—he should, of course, protect himself by cutting back the wood which projects over the boundary, and he may do this whether they are doing any damage or not. The damage may, of course, either be physical injury to a man's premises, when it can be gauged in pounds, shillings and pence, or it may be some interference with the beneficial use of the property, as where it interferes with the comfort of the persons who occupy it.

Having dealt with the subject of nuisances in general, it is interesting to note some of the various forms of nuisance for which the Law Courts have from time to time given redress.

## MANURE HEAPS.

In this instance we have a case in point: The plaintiff in the case occupied a house adjoining a market garden, and suffered physical inconvenience from the smell and from flies bred in a large heap of manure. The district was one where market gardening was carried on, although the particular manure heap was larger than might have been expected in the locality. The Court held that the manure heap amounted to a nuisance at law, since it was a serious inconvenience and interference with the comfort of the occupiers of the house adjoining the market garden, according to the notions prevalent among reasonable English men and women.

From this it will be seen that the locality

bears some weight in deciding whether a legal nuisance exists or not, for a man who goes and lives in a district where gardening and agriculture are carried on, cannot complain of the ordinary use of manure or the land; in addition the degree of the nuisance must also be considered, for if it is only such that ordinary men living in that locality are content to bear with, a fastidious person cannot contend that it materially interferes with the ordinary comfort of human existence.

## TREES.

I have stated that where a tree growing on one man's property overhangs on to that of another, an action for nuisance can only be maintained if some damage is being done. The branch in question may be continually breaking a glasshouse roof, or causing some other damage to the occupier, if this is so then he can bring an action against the owner for the damage done. He is, however, in addition, entitled to cut off any branches which overhang his property, and as regards this latter remedy he can do this whether they are damaging his premises or not, so long as he only cuts off those which are actually over his land and does no more damage to the tree than is necessary to carry out his purpose. It should also be remembered that the wood belongs to the owner of the tree and not to the person who has cut it.

## SMOKE AND FUMES.

In the case of smoke and fumes the action will usually be brought by—and not against—the gardener, against a factory owner for damage done by the fumes to his fruit trees and crops: in such a case if the reasonable enjoyment of the property is substantially affected by the fumes, the owner or occupier is entitled to an injunction to have it stopped. In a case on this subject, the occupier of property adjoining a Corporation's gas works brought an action claiming an injunction restraining the Corporation from carrying on their works so as to cause a nuisance to his property. It was alleged that fumes and smoke from the works were carried by the wind for a distance of one hundred to two hundred yards over the plaintiff's property and had injuriously affected his trees adjoining the gas works to such an extent that the tops were dying, while in some cases the trees were dead. The Court held that the occupier of the land was entitled to the injunction asked for, since the fumes were discharged in such a way as to be a nuisance causing injury to the plaintiff's property.

There are, of course, other forms of nuisance affecting the gardener—the obstruction of light is one which I have already dealt with in a former issue of *The Gardeners' Chronicle*—but to most of these it is possible to apply the general rule: that if some deleterious thing is allowed to escape from one man's premises on to another's, having an injurious effect on the comfort or enjoyment of those premises, for ordinary purposes as judged by the standard of ordinary people, then a nuisance for which legal redress can be obtained has been committed. Harold Sharman.

## VEGETABLE GARDEN.

## TREE ONIONS.

This type of Onion (*Allium Ceba proliferum*) is not frequently met with in English gardens. Recently, while in Compton, West Sussex, I met a man who found a clump of these plants in a corner of his kitchen garden, adjoining premises which he took over some two years ago. He did not know what they were, and took them for some weed. He therefore started digging them up to get rid of them, and threw the majority away, but they still kept appearing much as Jerusalem Artichokes do in land where they have grown. I was at first rather sceptical as to the possibility of these plants being really Tree Onions, but so exactly did his description of their habits of growth agree with those of *Allium Ceba proliferum* that I asked him to see if, perchance, there were any bulbs left. He kindly did so, and much to

\* *A Year in My Flower Garden*, by E. T. Brown. Published by Messrs. Chapman and Hall, London. 7/6 net.

† *Gardens for Town and Suburb*, by V. N. Solly. Published by Messrs. Ernest Benn, Ltd., London. 15/- net.

my joy, succeeded in finding a few young plants. When I saw them, shortly after Christmas, they appeared to be much like sturdy specimens of autumn-sown Tripoli Onions. By next summer they should, if left alone and properly cultivated, have attained to their normal height of from two feet to three feet, with good, stout stems bearing bulbs which, when fully grown, are valuable for pickling purposes. The stems should be supported by stakes, and the stem bulbs, when ripe, stored and kept in a dry place until they are required for use.

It was in a small cottage garden that I discovered these plants, but it is in just such places that interesting discoveries are often made. I tried to impress upon the owner the importance of sacrificing this small corner of his garden in order to preserve any remaining bulbs still in the ground.

I should esteem it a favour if any other readers who happen to be acquainted with A. C. proliferum, or who may have seen it growing in English gardens, would kindly give some further information as to the real utility of this vegetable for culinary purposes, and whether they recommend its culture in English gardens; also what they consider a fair average number of edible stem Onions per plant. I am aware that mature root bulbs should be planted one inch deep, in rows twelve inches apart each way, about the end of March. I know also that root bulbs are obtained from bulbs borne on the tops of the stems, by planting the latter much about the same season, one inch deep and four inches apart, in rows made eight inches asunder, to grow and develop beneath the ground into strong bulbs, to be used as parent root-bulbs the following year. I have not yet succeeded in finding any seedsman or nurseryman who stocks and sells Tree Onion bulbs. Captain E. A. Saunders, Havant, Hampshire.

## PUBLIC PARKS AND GARDENS.

CARSHALTON Urban District Council has made application to borrow £2,140 for laying out the Stanley Park Pleasure Ground.

CARDIFF Town Council proposes to lay out land on the north side of Maindy Pool, Gabalfa, as a recreation ground.

FOLKESTONE Town Council is negotiating for the acquisition of land for a recreation ground at Morehall.

THE Urban District Council of Orrell has received sanction to borrow £900 for the purchase and fencing of land at Bell Lane for a recreation ground.

SALFORD Town Council has made application for sanction to borrow £3,000 for laying-out the Ordsall recreation ground as a children's playground.

WALMER Urban District Council has received a gift of £1,000 towards the purchase of the site owned by the Transvaal and Rhodesian Estates, Ltd., required for a recreation ground. The purchase price will be £2,000.

SOUTHEND Borough Council propose to institute a separate department for the public parks and open spaces of the borough. A special committee which has been appointed for the reorganisation of the Borough Surveyor's Department, recommends that "a Park Superintendent be appointed who will be required to take charge of, maintain and control the Corporation's parks and open spaces, and to report direct to the Entertainments and Parks Committee upon matters under his control." The special committee has also recommended that Mr. Arthur Keeling, the present head gardener, be appointed to the position.

ADDRESSING a meeting in the Scottish Liberal Club, Edinburgh, on Monday, February 7, Mr. John J. Jeffrey, Superintendent of Parks and Gardens, said the net expenditure in the department last year was £40,000, and that the maintenance of sports facilities was now on an

economic basis. The Corporation maintained five golf courses, thirty-two public bowling greens, seventy-four tennis courts and ninety-two Association football pitches. With regard to Princess Street Gardens, the Parks Department tried to maintain a standard of efficiency worthy of the dignity and beauty of the street. To achieve this they endeavoured to keep in touch with the changing fashions of gardening. Most of their plant-raising was done at Inverleith Park, where the glasshouses were taxed to their utmost capacity at all seasons of the year.

At a public enquiry recently held by the Ministry of Health at Lewisham Town Hall, on the subject of the local town planning scheme of the London County Council, proposals were made for the substantial enlargement of the public open spaces in the boroughs of Lewisham, Greenwich and Woolwich, and for the retention as open spaces of certain privately owned sports grounds. Between thirty and forty acres of ground between the Downham Estate and Bromley were to be laid out as playing fields for the L.C.C. scholars and for recreation grounds and garden plots for the Downham tenants.

## FOREIGN CORRESPONDENCE.

### LEUCADENDRON ARGENTEUM.

I KNOW of only a few sub-tropical trees or shrubs that are as capricious and difficult to grow as *Leucadendron argenteum*, the Silver Tree or Witteboom of the Cape. Since its discovery it has always been admired for its large, lanceolate, pointed leaves, covered on both sides with shiny, silvery-white, adpressed hairs, that glisten in the light and render the tree or shrub visible at a great distance. It grows on the slopes of the Lionshead and other places in the near vicinity of Cape Town and somewhat to the east. As a garden plant it has been known for a long time, as seeds have been introduced frequently and may be obtained from seedsmen at any time. They are rather large, about the size of a Pea seed, and germinate freely.

There is no difficulty whatsoever in germinating them, and they soon develop nice seedlings. If these are never allowed to become too dry or too wet, they will continue to grow, and if the soil suits them they will remain strong and healthy.

*Leucadendron argenteum* is calcifugal; it likes a light sandy and peaty soil, like most of the Proteaceae and the Heaths.

It should be a fine plant for southern gardens in the open, and it should succeed in South-western Ireland and similar favoured places of the United Kingdom. It is sometimes seen on the Mediterranean shores, but on account of the calcareous soil and the difficulty in watering, it is a rare plant, and will always remain so.

The trees soon assume a conical shape and send out their branches in whorls, much in the way as young Fir trees. We once had in Italy a beautiful specimen, about five metres high. It was planted before my time in a large hole filled with "Terra di brugo," which is, however, not quite the same as our peat. It comes from the Italian lakes, and is used all over Italy for such-like plants, and answers the purpose. Generally it does not contain a grain of sand, and this material has to be added. Our plant grew exceedingly well at the foot of a large slope, and was shaded in the afternoon by large Cypress trees. I watched the soil carefully to see that it did not become very dry. This tree, like all Proteaceous plants, usually dies if it is given stimulants, and our tree was killed by an under-gardener, who gave it a large amount of liquid manure. I told him that the tree would be dead within twenty-four hours which he would not believe, but despite a liberal dose of clean water, the *Leucadendron* immediately began to fade, and rapidly died away as if killed by poison.

Since then every effort to replace the tree has been unsuccessful. We grew seedlings in quantities in small pots, and planted them

in various places with all sorts of precautions, and also sowed seeds directly in the soil, as seedlings dislike being transplanted, but we never were successful in getting another good specimen to replace the one we lost. Alwin Berger, Stuttgart, Germany.

## HOME CORRESPONDENCE.

**Coreopsis auriculata var. superba.**—As a border subject, this *Coreopsis* is a plant of more than usual merit. From neat bushes flowers of a rich golden-yellow are freely produced, with a crimson blotch at the base of each petal, thus forming a central coloured disc. It appears to be a true perennial and attains a height of two-and-a-half to three feet. For cut flower and decorative work it is excellent, and should also be suitable for marketing purposes. Propagation is best effected by division in March, or from cuttings inserted in sandy soil in a shady place during the summer months. S. R. D.

**Black Currant Bud Mite.**—Dealing with the Black Currant Bud Mite is not quite such a simple matter as the *Gard. Chron.* leader (p. 107) would seem to indicate. You may remember I was the first to publish and recommend the lime-sulphur treatment, which gave us first-rate results. That was some twenty years ago. Then came two or three seasons successively when, for weeks after the time for spraying arrived, it either rained like the deluge, or blew a howling gale, and spraying was absolutely impossible. Even with a power outfit, spraying takes time, and the problem is what to do when the weather is against one. Chas. E. Pearson, Loudham.

**Deep Trenching.**—I fully agree with Mr. W. Parker in his remarks on p. 151. Two cases in my experience go far to show how disastrous deep trenching can be without attention to manuring. In 1912, at Hindhead, I trenched some old Asparagus beds three feet deep for a crop of Sweet Peas. As the beds were some ten years old and had been well looked after, I considered no manure was required. The work was completed before Christmas, and in February a light dressing of basic slag and kainit was forked into the soil. The Sweet Peas were autumn-sown and fairly strong at the time of planting. They were never quite happy; a little streak made its appearance in early May, and the crop was a comparative failure. The following year I decided to break up a piece of virgin common land, the soil here being white sand under the natural heather peat, with an incongenial subsoil of hard, brown sand. The ground was trenched four feet deep, and as the work of digging proceeded, each layer of soil had a fair amount of well-rotted manure forked into it, and received an occasional dressing of bone-meal. When finished, the ground received a liberal dressing of basic slag and kainit in March, and a further dressing of bone-meal, soot and lime was forked into it. The growth of Sweet Peas on this land was marvellous. I exhibited twice that season and secured first prize each time. Deep trenching combined with systematic feeding gives excellent results, but to merely trench the ground and to bring the subsoil to the surface can be very disastrous, as a later experience I had in the same district showed. During the winter of 1919-20, I was supervising the making of a new kitchen garden at Hindhead, in a low-lying position facing south. The soil to a considerable depth, was a sandy loam on clay. Manure was difficult to obtain, and for economical reasons it was decided to proceed with the work without using manure. The plot was divided into four parts, two being trenched that season two feet six inches deep. One breadth was planted with Sir John Llewelyn, Golden Wonder, Kerr's Pink, King Edward and Arran Chief Potatoes. The variety Sir John Llewelyn, in spite of being cut down by frost in May, produced a moderate crop; so also did Kerr's Pink; the other varieties hardly returned the seed, and were absolute failures. The second plot was used for Brassicas, Beets, Carrots, Parsnips and Onions, which were

complete failures. I do not think that fifteen per cent of the seeds of these crops germinated, and a further sowing in April, after dressing the ground with soot and lime, proved almost as disastrous. Peas, although they germinated badly, produced a fair crop, as also did Runner Beans. Sprouts, Savoy, and a few Cauliflowers were very good, some wonderful Cauliflowers being produced in the following September. Trenching before sowing small seeds, such as Carrots, Onions and Parsnips, proved disastrous, for the crops were complete failures. Potatoes, except the stronger varieties, were also a failure. Had plenty of manure been incorporated with the surface soil to encourage growth in the early stages, very different results would have been obtained. In my opinion, deep trenching and exposing the subsoil must be done with caution. *T. Whitham, St. Edmunds College, Old Hall, Ware.*

—Trenching is certainly beneficial to the soil and also to the subsequent crops, but it is not always advisable to bring the second spit to the top owing to it being far from suitable for planting. The greatest asset to the gardener in the process of trenching is a supply of manure, garden rubbish and leaves. In bastard trenching the general practice is to place a liberal amount of manure in the bottom of the trench after it has been forked up, instead of incorporating it with the bottom spit. The result is that the bottom spit is not improved in texture as it might have been. I saw recently land that had been trenched in which the trench had been filled level with leaves, etc., and stamped down; the result is the trenched ground is over high, and next year no doubt, the leaves, etc., will be dug up in very much the same condition as when they were put in. This, I consider, will not help the subsoil to become more friable and will tend, I think, towards acidity. Light dressings of manure, well incorporated with both the forked up bottom and the next spit in bastard trenching, would greatly help to improve moderate to heavy soils. In the case of chalky subsoils, a certain amount of chalk could, with advantage, be brought to the top and forked in during spring. Soils overlying chalk are very often benefited by such a dressing. I consider that bastard trenching is by far superior to trenching in nearly all cases which come before the average gardener. *Lewis Cave, Copford Hall Gardens, Colchester.*

**Primroses and Pollination.**—I was much interested in the leading article in *The Gardeners' Chronicle* of February 26, as it deals with a subject in which I have long been interested, but never in a position to make sufficiently extensive observations. Incidentally, I must point out that the writer is not accurate in classing *Bombus discolor* as a bee! It, and its congeners, major, medius, and minor, are two-winged flies belonging to the Diptera, whereas bees of all kinds are four-winged and belong to the Hymenoptera. The commonest species is major, which I have often seen visiting Primroses and other flowers. These flies are parasitic, as larvae in the nests of the solitary bees of the genera *Andrena*, *Colletes*, etc. *C. Nicholson, Hale End.*

**Winter-flowering Myosotis.**—A pleasing contrast to the pink and red shades of Primulas and Cyclamen may be made with plants of Sutton's Pot Myosotis. A group of forty plants in the conservatory have been much admired during the past two months. The culture of this Forget-me-not is very simple. The seeds are sown in a pan early in June and placed in a cold frame, the seedlings being subsequently pricked out into boxes. When large enough, these are transferred to three-and-a-quarter-inch pots, and later into six-inch pots. During the first week of October we place the plants on a shelf, near the roof-glass, in a greenhouse with a temperature of about 50°. They commence to bloom in the middle of December, when blue flowers are very scarce. A compost of fibrous loam, with a little leaf-mould and sand suits them, but overcrowding must be avoided as a precaution against mildew. *William Clarke, Copley Gardens, Thornton Hough, Birkenhead.*

## SOCIETIES.

### ROYAL HORTICULTURAL.

**MARCH 8 AND 9.**—The first two-day show of the year at Vincent Square was fully worthy of the occasion. From now until the late autumn the demands of the space do not permit the exhibition of paintings and garden sundries, and the R.H.S. Hall was filled with a great variety of plants and flowers. Orchids were extensively shown, and these were of considerable beauty and merit. The Orchid Committee recommended two First Class Certificates and four Awards of Merit to novelties. Spring flowers, particularly Hyacinths, forced shrubs of many kinds, and alpine were the chief floral features. The Floral Committee recommended two Awards of Merit to novelties. The Tulip and Narcissus Committee did not recommend any award to novelties, but there were several good collections of Narcissi. There was no exhibit of importance before the Fruit and Vegetable Committee.

#### Orchid Committee.

**Present:** Mr. C. J. Lucas (in the chair), Mr. Gurney Wilson, (Hon. Secretary), Mr. R. Brooman White, Mr. Fred J. Hanbury, Mr. Sidney Flory, Mr. A. Dye, Mr. H. G. Alexander, Mr. Fred K. Sander, Mr. Charles H. Curtis, Mr. J. E. Shill, Mr. J. Cypher, Mr. W. H. Hatcher, Mr. J. C. Cowan, Mr. Henry H. Smith, Mr. A. McBean, Mr. T. Armstrong, Hon. H. D. McLaren, Mr. E. R. Ashton, Mr. J. Wilson Potter and Mr. Stuart H. Low.

#### FIRST CLASS CERTIFICATES.

*Cymbidium Flamingo Memoria Sir Geo. Holford (Alexanderi × Merlin).*—A magnificent Cymbidium; the very large, exquisitely-formed flowers are of fine substance. The sepals are deep blush colour and the petals white, sometimes tinted blush. The lip is white, tinted blush, with a heavy, deep brown mark at the apex, this deep colour running back in broken lines towards the raised yellow disc. Shown by Messrs. H. G. ALEXANDER, LTD.

*Odontodia Frederick J. Hanbury (parentage unknown).*—No plant attracted so much general attention as this. It was a finely-grown specimen carrying one spike nearly four feet long, branched and bearing sixty-one brilliant flowers of good shape and size. The colour is rich reddish-scarlet, with tiny, buff teeth on the edges of the petals; lip dull yellow, but with this ground colour almost covered with deep red scarlet. Shown by Messrs. J. and A. McBEAN.

#### SILVER LINDLEY MEDAL.

The Orchid Committee recommended the award of a Silver Lindley Medal to Messrs. J. and A. McBEAN for *Odontodia Frederick J. Hanbury*, and to Messrs. H. G. ALEXANDER, LTD., for *Cymbidium Flamingo Memoria Sir Geo. Holford* (see above).

#### AWARDS OF MERIT.

*Cymbidium Rosanna (Kittiwake × Alexanderi).*—A choice hybrid with lovely pink sepals and petals, and lip with deeper rose and rose-pink colour with red marks on the apex. Shown by Messrs. H. G. ALEXANDER, LTD.

*Odontodia Pitiaie var. Empress (Oda. Juliet × Odm. St. James).*—In size, form and substance this is one of the finest *Odontodias* yet seen. The colour is rose with heavy markings of deep, rich red-brown, while the base of the lip is light yellow. Shown by Messrs. CHARLESWORTH AND CO.

*Miltonia Beau Brummel var. superbissima (Venus × Bleuana var. Reine Elizabeth).*—Although only represented by a small specimen, this is a brilliant Orchid of rich crimson colouring, all the segments being shaded at the margins with deep rose red. The mask is orange-yellow, edged with rose. Shown by Messrs. CHARLESWORTH AND CO.

*Cattleya Thora, Brockhurst var. (Empress Frederick × Mrs. Pitt).*—A handsome flower of

large size and good form. The deep rose-purple sepals and petals set off the wide, frilled lip, which is soft orange-yellow, surrounded by purplish-rose. Shown by FRED. J. HANBURY, Esq., Brockhurst, East Grinstead.

#### GROUPS.

A marvellously fine exhibit of *Cymbidiums* arranged by Messrs. H. G. ALEXANDER, LTD., was the most striking feature of the meeting. The display was made on a long run of eight-foot tabling, and all the plants were most effectively arranged and finely shown. Some of the specimens were of large size; one of *C. Pauwelsii* carried six grand spikes. The colour range arrested the attention of all Orchid lovers, who were specially interested in the specimens of *C. Parishii*, *C. eburneum*, *C. insigne* and *C. eburneo-Lowianum*—the parents of the splendid variety now available, and for which Westonbirt is largely responsible. A few outstanding sorts were *C. Goosander*, *C. Alexanderi* var. *Magnolia*, *C. A. Alabaster*, *C. Lettie*, *C. Rosanna* of fine substance and warm pink colouring; *C. Martin*, *C. Ringdove*, *C. Flamingo*, *C. Butterfly*, *C. Pepit grandiflora* and *C. Curlew*, yellowish-green, but the outstanding plant was *C. Flamingo* var. *Memoria Sir George Holford*, with finely-formed substantial and lovely pink-tinted flowers of great beauty—a worthy plant to commemorate the late master of Westonbirt.

A glorious group of Orchids from Messrs. J. and A. McBEAN had a large specimen of *Cymbidium Ceres* var. *Profusion* as a centrepiece; this plant carried a dozen spikes, each upwards of a yard long. Other choice *Cymbidiums* were used to form a graceful background, together with finely-grown *Odontoglossums* and *Odontodias*, the former including *O. harvengtense*, *O. eximium*, *O. Conqueror*, *O. Martius* and *O. triumphans*. Among the *Odontodias* the outstanding specimen was *O. Frederick J. Hanbury*, with a branched spike of over sixty large and brilliant flowers—probably the finest *Odontodia* spike ever seen. *Miltonia* St. Andre, *Laelio-Cattleya Eunice alba*, *L.-C. Schröderiana*, the bright *L.-C. Arcturus*, *Epiphronitis Veitchii*, *Phalaenopsis Rimestadiana*, *Oncidium McBeanianum* and *Cypripedium Mrs. W. Pickup* were a few other subjects of great beauty and interest.

Messrs. COWAN's group contained a fine selection of *Cymbidiums*, of which *C. Ceres*, *C. Pauwelsii* var. *Enchantress*, and *C. Alexanderi* were especially good. *Cattleya Suzanne Hye de Crom* and *C. Enid* var. *La Perle* occupied prominent positions in the group, while *Dendrobiums*, *Cypripediums*, the old *Ada aurantiaca* and *Miltonia Bleuana* were included in this bright exhibit.

Messrs. SANDERS' large group of *Cymbidiums* attracted a great deal of attention, especially *C. Pauwelsii*, *C. Erica*, *C. Yellow Hammer*, *C. Ceres* var. *The Torch*, and *C. Alexanderi* roseum. With these were associated *Miltonia Bleuana* Gold Crest, *M. St. Andre*, very fine; *Brasso-Cattleya Primrose Queen*, and several fine plants of the broad-leaved *Oncidium Cavendishianum*.

Coloured *Odontoglossums* were shown splendidly by Messrs. CHARLESWORTH AND CO., and among these were such showy subjects as *O. Promerens*, *O. Creone*, *O. Muralis*, *O. Omega*, *O. Harold* and *O. Henry VIII*, the last a very fine form. *O. crispum xanthotes* was also well shown, together with *Cymbidiums*, *Odontodias*, *Dendrobiums* and *Vuystekeara Sylvia*. Messrs. SUTTON BROS. showed *Odontoglossums*, *Laelio-Cattleyas*, *Calanthe* Wm. Murray and numerous *Cypripediums*, these last including *C. The Great Mogul*, with wide, rose, green and brown dorsal sepal.

Messrs. ARMSTRONG AND BROWN contributed a great variety of Orchids. *Odontoglossum Edwardsii* figuring in the background; there were several capital *Odontodias*, fine *Dendrobiums*, *Cattleya Octave Doin*, together with *Leptotes bicolor*, *Coelogyne sparsa* and *Cirrhopetalum picturatum*.

*Cypripedium Helen* was well shown by Mr. HARRY DIXON, who also had *Cymbidiums* and *Dendrobiums*. In Messrs. STUART LOW AND CO.'s exhibit the leading subjects were *Dendrobium Thwaitesiae*, *Veitch's* var., *D. Victoria Reginae*, *Brasso-Cattleya Hans Hunter*, *Zygo-*

petalum Mackayi, Laelio-Cattleya Schröderae and Phalaenopsis Schilleriana.

Good examples of Dendrobium Findlayianum and D. Wardianum were shown by W. R. WILSON WARD, Esq. (gr. Mr. H. Meryfield), Timsbury Manor, Romsey. Messrs. FLOREY AND BLACK showed Laelio-Cattleya Montrose and L.-C. Colleen, two new crosses.

### Floral Committee.

*Present:* Section A.—Mr. Henry B. May (in the chair), Mr. J. F. McLeod, Mr. A. Turner, Lady Beatrix Stanley, Mrs. Ethel M. Wightman, Mr. H. J. Jones, Mr. J. M. Bridgeford, Mr. Donald Allan, Mr. R. Findlay, Mr. W. H. Page, Mr. E. R. James, Mr. Hugh Dickson, Mr. A. E. Vasey, Mr. James B. Riding, Mr. W. B. Gingell, Mr. George Churcher, Mr. Courtney Page, Mr. D. B. Crane, Mrs. Helen Lindsay Smith, Mr. Charles E. Pearson and Mr. William Howe.

Section B.—Mr. Gerald B. Loder (in the chair), Mr. W. J. Bean, Mr. G. Reuthe, Mr. Amos Perry, Mr. W. B. Cranfield, Mr. Reginald Cory, Mr. E. A. Bowles, Mr. L. R. Russell, Mr. A. Bedford, Mr. E. H. Wilding, Mr. A. Williams, Mr. F. G. Preston, Mr. G. Yeld, Mr. T. Hay, Mr. Mark Fenwick, Mr. Charles T. Musgrave, the Hon. Henry D. McLaren, Mr. R. D. Trotter, Mr. C. J. Lucas, and Sir William Lawrence, Bart.

### AWARDS OF MERIT.

*Crocus Imperati var. alba.*—This is a particularly good variety of the well-known purple-feathered Italian Crocus. The large white flowers have definite yellow markings at the base of each segment, and the filaments are of rich yellow and orange. Shown by Mrs. W. R. DYKES, Bobbingcourt, Sutton Green, Surrey.

*Helleborus orientalis Prince Rupert.*—Many of the varieties of the long-stemmed Oriental species have a nodding habit, and fail to disclose their beauties fully, but this new variety carries its large, twin-flowers well and their great attractions are at once apparent. The round, substantial flowers are of creamy-white colour freely spotted with soft carmine. It is a valuable novelty for the hardy flower border. Shown by Messrs. BARR AND SONS.

*Rhododendron cilipense.*—This attractive hybrid evergreen Rhododendron was raised by crossing *R. ciliatum* with *R. moupinense*. It appears to form a neat bush well furnished with two- or three-flowered trusses of very attractive flowers. The latter are rounded, about two-and-a-half inches across, and open widely. They are of good substance and sparkling white, lightly flushed with pink on the upper segments. There are small, rose-coloured spots on the two upper segments. The flower buds are stained a deep rich pink. The shining green leaves are about four inches long and almost elliptical in shape. Shown by LADY ABERCONWAY and the Hon. HENRY D. McLAREN, Bodnant, North Wales.

### OTHER NOVELTIES.

The tall, rather straggling Rhododendron, *Mackenzianum*, shown by LIONEL DE ROTHSCHILD, Esq., Exbury, Southampton, bore flowers of uncommon type and beauty. These are produced in rosettes of five or six, and usually a single bloom, though on occasion two, rises from a sheath of bracts quite enclosing the rosy-purple stalks. The milk-white flowers are about three inches across, flushed with rosy-purple on the outside and have an aromatic fragrance. Two pots of the dainty little *Narcissus canaliculatus*, from bulbs collected near Mentone, were shown by Messrs. BARR AND SONS. These were a great attraction and may be likened to miniature *Tazetta* varieties. On the table for exhibits of novelties from small exhibitors, Sir WILLIAM LAWRENCE, Bt., Burford, Dorking, showed plants of *Eucharis* × *Lawrencei* bearing pendulous, globular, white flowers; *E. × burfordensis*, a cross between *E. Mastersii* and *E. Sanderi*, which received a First Class Certificate, in September, 1899, and *Haemanthus natalensis*, bearing an orange-coloured inflorescence. Mr. CHARLES T. MUSGRAVE, Hascombe Place, Godalming, showed a plant of the uncommon *Ranunculus calandrinoides*.

### GROUPS.

An immense quantity of splendidly-grown Hyacinths was shown by Messrs. SUTTON AND SONS. These were arranged in the form of large oval group. The level of the plants was pleasantly broken and the colour effect was exceptionally good. The very many excellent varieties included *Ivanhoe*, dark blue; *Madame Kruger*, Purity and Arentine Arendsen, good whites; *City of Haarlem*, yellow; *Queen of Pinks*, Orange Cerise, Orange Boven, La Victoire, bright rose; *Dame d'Honneur*, pale rose and Marconi, pink.

On a table space, Messrs. J. CARTER AND CO. had a graceful group of Hyacinths arranged in a series of circles surmounted by elegant plants of *Cocos Weddelliana*. Their varieties included *Moreno*, blush; *Roi de Belge*, red; *Avalanche* and *La Grandesse*, white; *Marconi*, pink; *Lord Derby*, pale salmon; *Dr. Lieber*, blue; *Ivanhoe*, dark blue; *Queen of Pinks*, General de Wet, blush; and *Schotel*, china blue.

In an interesting exhibit, Messrs. BARR AND SONS included several excellent varieties of *Lachenalia*, such as *Goldfinch*, *Greenfinch*, *Rosemary* and *Nelsonii*. They also had ample batches of *Tulipa Kaufmanniana*, *Erythronium Dens-canis rosea*, several valuable dwarf early *Irises*, *Crocus Kathleen Parlow*, a fine white variety and *Crocus Pallas*, of lovely feathered lilac colour. Behind these useful general border flowers they staged a considerable row of *Narcissi*. The large Trumpet varieties were very prominent and in addition to several very good seedlings the collection included *King Alfred*, *Anastasia*, and *Mustapha* of rich yellow colours, *Alicia*, sulphur perianth and lemon corona, and *Aerolite*.

*Rhododendrons* of considerable beauty were shown by Vice-Admiral WALKER-HENEAGE VIVIAN, Clyne Castle, Swansea. The chief sorts were hybrids of *R. catawbiense* and *R. Thomsonii*, *R. arboreum* and the variety *roseum* and many splendid trusses of *R. grande*. With these *Rhododendrons* were shown sprays of *Camellias*, *Pieris japonica* and *Daphne odora*. Messrs. R. GILL AND SON had bright trusses of *Rhododendron arboreum* × *barbarum*, *R. Bernard Gill* and *R. Cornubia* with *R. Nobleanum pictum* and *R. argenteum*.

In association with various other shrubs and alpine, Mr. G. REUTHE staged sprays of *Camellias* and *Rhododendrons*, *Pieris japonica*, *Acacia Baileyana*, *Iris reticulata*, some good *Crocuses* and many alpine.

The forced shrubs arranged by Messrs. L. R. RUSSELL, LTD., included many good varieties of *Azalea indica* and *A. mollis*, *Prunus triloba* fl. pl. and some graceful *Vitis*es. *Prunus triloba* fl. pl., Japanese *Azaleas*, *Irises* and *Muscari Heavenly Blue* were staged by Messrs. HODSONS, LTD.

At the back of an attractive sandstone rock garden, Messrs. WILLIAM CUTBUSH AND SON grouped various *Azaleas* and *Prunuses*. In the rock garden they planted *Tulipa praestans* Tubergen's var., *Crocuses*, *Iris bucharica* and other appropriate plants. Messrs. W. M. WOOD AND SON, LTD., planted *Saxifragas*, in variety, *Primulas*, *Erica carnea*, *Prunus triloba* fl. pl., *Forsythia suspensa* and *Spiraea Thunbergii* in an attractive rock garden. Under the clock, Messrs. JEANS AND TROWBRIDGE had a small rock garden.

A good variety of *Saxifragas* were shown by Messrs. W. H. ROGERS AND SON. They also included *Soldanella montana*, and *Cupressus juniperoides*, with other alpine. Mr. F. G. WOOD had goodly breadths of various *Primroses*, including the soft mauve *Primula altaica*, with several species of *Pulmonaria*.

In a well-arranged rock garden, Mr. CLARENCE ELLIOTT planted *Saxifraga Grisebachii* Wisley var., *S. Myra*, *S. oppositifolia splendens* and *S. Gloria*. *Anemone fulgens* made a bright patch of colour in the exhibit of Messrs. M. PRICHARD AND SON, who also showed *Saxifraga Irvingii*, *S. oppositifolia splendens*, *S. Grisebachii* and *S. apiculata alba*. Messrs. TUCKERS, LTD., had good plants of *S. Salmonei*, *S. arco-valleyi*, *S. oppositifolia splendens* and *S. Burseriana speciosa*.

In their exhibit, Messrs. WATERER SON AND CRISP included *Muscari azureum*, *Iris sind-pers*,

*Crocus aureus*, several distinct *Erythroniums* and a collection of *Cyclamen ibericum*.

Mr. J. ROBINSON and the Misses HOPKINS had small collections of useful alpine.

Most attractive groups of the lovely blue *Iris Cantab* and *Iris reticulata* were staged by the Rev. H. P. MAYER, Watton, Herts. Messrs. MAXWELL AND BEALE had *Saxifragas*, *Aethionema iberica* and *Erica carnea* in their exhibit.

An admirable collection of alpine in pots and pans was staged by C. G. KIRCH, Esq. (gr. Mr. J. Wall), Edenhall, Beckenham. Many of the plants were of considerable size and were flowering beautifully, while all illustrated excellent cultivation. The many distinct alpine included *Saxifraga Grisebachii* and the *Wisley* var. *S. Stuarti rosea*, *S. Schilleri*, *S. Burseriana sulphurea*, *S. × Gem*, *S. Jenkinsii*, *S. His Majesty*, *S. R. V. Prichard*, *S. Faldonside*, *S. Boydii*, *S. Gloriana* and *S. Grace Farwell*. *Daphne Blagayana*, *Primula Fortunei*, a pretty, mealy little plant bearing pendulous lilac-mauve flowers, and the lovely blue *Tecophilaea cyanocrocus*.

A large exhibit of excellent greenhouse *Cyclamens* was made by Mrs. R. EMMET, Moreton Paddock, Warwick. These plants, shown in distinct shades of colour, filled a whole length of tabling. Mr. W. FORSYTH again staged a good selection of the Caledonia strain of greenhouse *Cyclamen*.

A neat collection of forced *Roses* was displayed by Mr. ELISHA J. HICKS. His varieties included *Climbing Lady Hillingdon*, *Angele Pernet*, *Mrs. H. Stevens* and *Dorothy Dix*. Messrs. C. ENGELMANN, LTD., showed many good *Carnations*, including *Dorcas*, rich dark red; *White Pearl*, *Red Laddie* and *Cupid*. Messrs. ALLWOOD BROS. and Messrs. STUART LOW AND CO. also had attractive collections of *Carnations*. The latter included plants of *Hippeastrums* and *Camellias*. Mr. J. J. KETTLE had a good collection of *Violets*.

BARON BRUNO SCHRODER (gr. Mr. E. J. Henderson), The Dell Park, Englefield Green contributed a large group of handsome *Clivia* miniata varieties with *Dracaena Victoria* and *D. Deremensis Bausei*. The *Clivias* bore large trusses of exceptionally fine blooms.

### Narcissus and Tulip Committee.

*Present:* Mr. E. A. Bowles (in the chair), Mrs. Brodie, Miss Willmott, Mr. W. Poupert, Mr. J. Jones, Mr. C. W. Needham, Mr. G. Churcher, Mr. C. C. Titchmarsh, Mr. Alfred W. White, Mr. J. de Graaff, Mr. W. B. Cranfield, Mr. F. Secrett, Mr. Charles H. Curtis, Mr. G. W. Leak, Mr. P. R. Barr, Mr. J. D. Pearson and Mr. A. Simmonds (Secretary).

An extensive collection of *Narcissi* set up by Messrs. J. R. PEARSON AND SONS included many vases of the Trumpet varieties. The chief were General Townsend, Florence Pearson, white perianth, primrose corona; Lord Roberts, rich yellow; Victoria, white perianth, yellow corona; Golden Emperor and Hon. Mrs. Francklin, white perianth and lemon corona. They also had attractive vases of the double-flowered *Argent* and the richly coloured *February Gold*.

The large Trumpets also predominated in the collection of Mr. J. W. BARR. His varieties included *maximus superbus*, of rich colour; Brian, rich yellow; King Alfred and Victoria. Amongst the Barrii varieties were *Sunrise*, *Brillancy* and *C. J. Backhouse*.

A large collection of bulbs in vases and bowls of fibre was again staged by Messrs. R. H. BATH, LTD. As before, they were well-grown and made a bright display. The *Narcissi* included *Harmony*, *Olympia*, *Madame de Graaff* and *Butterfly*. Chief amongst the many *Tulips* were McKinley, William Copland, Queen of Violets and Thomas Moore. The exhibit included pans of excellent *Crocuses*.

Mr. G. W. MILLER had a considerable variety of *Narcissi*, *Tulips* and *Hyacinths*. The last-named included *King of Whites*, *King of Yellows*, *Queen of Pinks* and *Orange Boven*. The best *Tulips* were *Couleur Cardinal*, *Mon Tresor* and *Cramoise Brilliant*.

**Fruit and Vegetable Committee.**

*Present:* Mr. C. G. A. Nix (in the chair), Mr. J. Cheal, Mr. W. Poupart, Mr. A. Bullock, Mr. A. E. Newby, Mr. E. Harriss, Mr. P. D. Tuckett, Mr. A. Poupart, Mr. E. Laxton, Mr. F. Jordan, Mr. E. Beckett, Mr. H. Markham, Mr. W. H. Divers, Mr. G. F. Tinley and Mr. A. N. Rawes (Sec.).

Some excellent fruits of Apple William Crump were shown by Mr. J. Jones, Ynys-y-Maengwyn, Towyn-on-Sea, Merionethshire.

Cooked and uncooked tubers of the new Potato Sefton Wonder were shown by the GARDEN SUPPLIES, LTD., Liverpool. This is a seedling from Great Scot, and certified as an immune variety.

**GUILDFORD AND DISTRICT GARDENERS'.**

THE monthly meeting of this Association, held on February 14, was well attended. The President, Alderman W. T. Patrick, J.P., occupied the chair.

Mr. A. J. Joy, for more than thirty years gardener at Snowdenham Hall, read a paper on "Annuals, Inside and Out." Mr. Joy made special reference to Antirrhinums which, if raised in February or March in gentle heat, would be available for summer bedding, and in due course provide a more or less continuous show of colour.

Some plants that are usually regarded as annuals, said Mr. Joy, may be treated as biennials, and under proper treatment will give even better results as such. For sowing out-of-doors, the second or third week in May was recommended.

In conclusion, Mr. Joy advised his hearers not to despise the weaklings amongst seedlings, but to pick them out especially for pot culture, for with good treatment they will make the best plants.

At the next meeting, to be held on Monday, March 14, Mr. A. E. Burgess, Superintendent to the Surrey County Council Agricultural Committee, will deliver an address on "How Plants Grow."

**GARDENERS' ROYAL BENEVOLENT INSTITUTION.****LIVERPOOL AUXILIARY.**

THE annual smoking concert of the Liverpool Auxiliary of the Gardeners' Royal Benevolent Institution was held at the Washington Hotel, on February 25.

Mr. J. J. Guttridge, Chief Superintendent and Curator of the Liverpool Parks, was Chairman, and in proposing the toast of the Auxiliary, gave a brief résumé of its objects and the good work it did for the gardening profession, concluding by recommending all gardeners to become annual subscribers. Mr. Robert B. Ker, the Chairman of the Liverpool Auxiliary, briefly responded, and added that he was one of the founders of the Liverpool Auxiliary in 1902, and had been on the Committee for twenty-five years.

Mr. W. J. Earl, gardener to the Earl of Derby, announced that he had organised a dance and social evening at the Village Hall, Knowsley, on February 11, on behalf of the Auxiliary Funds, and he had pleasure in handing the treasurer a sum of £14. A hearty vote of thanks was accorded to Mr. Earl for his effort.

An excellent musical programme, under the direction of Messrs. W. Grindley and D. Roberts, provided entertainment during the evening.

**BIRMINGHAM GARDENERS'.**

At the fortnightly meeting held on February 21, Mr. J. Smith presided and Mr. Clive Greaves, of Messrs. Hewitt and Co., Solihull, gave an interesting address on "Delphiniums and Gladioli." He spoke more as a salesman than a grower, but pointed out that both plants had made great strides in popularity since the war, and there was a large trade with America, where the Delphinium craze is rivalling the Tulip boom of a few years ago. A scented variety is reported to have been raised there. A list of up-to-date varieties of each plant was given by the lecturer.

**Obituary.**

**William Longman Corry.**—The doyen of horticultural sundriesmen and veteran head of the firm of Corry and Co., Ltd., passed away on Friday, March 4, and was laid to rest on Tuesday last. He died at his residence, St. Katherine's, Caterham Valley, after a short illness. During his long life of eighty-six years, he had enjoyed good health, and regularly attended to business until a year or so ago. A portrait and appreciation of Mr. W. L. Corry appeared on p. 42 of *The Gardeners' Chronicle* for July 17, 1926.

**Daniel Neilson.**—Mr. Daniel Neilson, Smeaton Gardens, Dalkith, died on February 24, and was buried in the New Cemetery, Dalkeith, on Monday, the 28th ult. He was eighty-seven years of age. Beginning work at an early age in the mines belonging to the Duke of Buccleuch, for reasons of health and the closing of the mines,

THE LATE W. P. THOMSON  
(see Obituary Notice, p. 170.)

he rented some land from the Duke and formed a market garden in 1881. He proved to be a successful cultivator of Celery, and was always to the front early in the season. His other produce showed up well in the Waverley market, Edinburgh, also. During late years, he had been taking things easier, and since December, 1926, had been confined to his bed. His wife predeceased him three years ago. He had five sons, two of whom are dead, and two daughters. Mr. Sanderson, his son-in-law, carries on the business in conjunction with the Gibraltar Garden, Dalkeith, where he resides.

**John White.**—After an illness lasting about a month, Mr. John White, of Messrs. J. H. White and Son, Worcester, passed away on Tuesday, March 1. Mr. White was in his seventy-sixth year, and was well-known among West of England horticulturists. In his earlier years he was employed at Witley, at Messrs. J. Veitch and Sons' Chelsea Nurseries, at Gunnersbury Park, and in several Irish gardens. After this experience he joined his brother, the late Mr. Joseph White, in the management of the nurseries at Lower Wick, Worcester. He took a keen interest in the gardening charities and for nearly twenty years had been Treasurer of the Worcester Auxiliary of the Gardeners' Royal Benevolent Institution.

**GARDENING APPOINTMENT.**

**Mr. Wm. Balcombe,** for the past 174 years gardener to Mrs. GRAHAM SMITH, at Easton Grey, Malmesbury, Wiltshire, as gardener to the same lady at Sindlesham House, Wokingham, Berkshire. (Thanks for 2/6 for R.G.O.F. Box.—Eds.)

**TRADE NOTE.**

READERS will be interested to learn of the successes gained by the produce of British seeds at the Bombay Presidency Agricultural Show, held at Poona, in October last, under the Presidency of His Excellency the Governor, Lieut.-Col. the Rt. Hon. Sir Leslie Wilson, P.C., G.C.I.E., C.M.G., D.S.O. For the general excellence of their exhibit of flowers, and for the magnificent lawn, from seeds, adjoining the Governor's Pavilion, Messrs. Sutton and Sons received the high award of a Gold Medal. In addition, at the "Garden Competition" organised by the Agri-Horticultural Society of India, both the premier awards, i.e., Challenge Cups in Classes A and D were won by Messrs. Sutton's customers, while the Viceroy's and the Governor's Medals were also gained by exhibitors with the produce of Sutton's seeds.

**ANSWERS TO CORRESPONDENTS.**

**CARNATION LADDIE.**—C. I. There should be no difficulty in rooting this variety, provided the cuttings are taken from stock plants that have not been fed with stimulating manures. We recommend you to grow a few stock plants for the purpose of producing cuttings. Plants grown under natural conditions should produce good cuttings during November to January, which are the three best months for propagating this variety. Cuttings inserted in a compost of half loam and sand, and placed in a propagating frame in a temperature of from 50° to 55°, should give good results. Another method of increasing this variety is by layering during the spring and summer; large batches may be raised by this method with good results.

**CUCUMBERS AND VINES.**—J. H. There is no advantage in repotting seedling Cucumbers from sixty-sized to thirty-two-sized pots; if the beds are ready they should be planted direct from the seedling pots. Vines that have been kept cool all the winter will start of their own accord in March; you should then close the house, syringe the vines once or twice a day, water the border and supply the necessary atmospheric moisture by damping the paths and borders daily.

**NAMES OF FRUITS.**—R. C. Pear Josephine de Malines. W. H. M. Apple Castle Major.

**NAMES OF PLANTS.**—Old Reader. 1, *Carex brunnea variegata*; 2, *Thuya dolabrata variegata*; 3, *Cryptomeria japonica elegans*; 4, *Juniperus chinensis*. J. H. W. 1, *Elaeagnus pungens aureo-variegata*; 2, *Viburnum Tinus*; 3, *Myrtus communis*; 4, send when in flower. S. D. *Asparagus verticillatus*; 2, *Daphne indica*. A. R. *Euonymus japonicus aureus*.

**SUMMER PRUNING OF FRUIT TREES.**—S. B. The best time to summer-prune your fruit trees is from the middle of June to the middle of July, according to the earliness or lateness of the season. If all the wood was left to grow on some varieties, the trees would soon become a tangled mass of shoots. One summer pruning should suffice in your case, as second or more prunings or stoppings should be avoided. The extent to which a shoot should be shortened requires skill, experience and knowledge of varieties; in the case of Apples, four to eight buds may often be left on the young wood. If the shoot is weak, two or three buds may be sufficient; if strong, four or more had better be left. The leading shoots are generally better left unpruned in summer, unless there is no room for further extension of growth, as this unchecked growth helps to maintain the strength of the tree and tends to increase its fertility. Short, spur-like growths of four to six buds, with a cluster of leaves and a fruit bud at the end should be retained especially on such varieties as Beauty of Bath and Worcester Pearmain.

King Alfred and Madame de Graaff. Darwins are the more numerous amongst Tulips, and they are finer in quality. The varieties now include Bartizan, Clara Butt, Wm. Copland, Elizabeth Lenore, Farncombe Sanders and a few Rev. Ewbank. Of Roses, Richmond is now more plentiful from home growers. A few blooms of Kaiserin Augusta Victoria, Hadley and Ophelia are being received from Holland, but they arrive in a rather soft condition. Spanish Irises are increasing in quality and some very fine blooms of blue and mauve varieties are now on sale. Daffodils and Narcissus continue to arrive in large quantities from Guernsey and Scilly. Supplies from the latter source have been generally poor in quality, and have not arrived in the best of condition owing to the mild weather. Those from Guernsey have been harder and reached the market in a better condition. Anemone fulgens, A. St. Brigid, Freesia and single Violets have been fairly plentiful from Guernsey. Inferior grades of Daffodils and Yellow Narcissus have been difficult to clear. In the French flower department conditions of trade are similar to those of last week. Narcissus Paper White, Acacia (Mimosa) and Marigolds are getting over for this season. Single Violets are arriving in a very unsatisfactory condition owing to the long time in transit. Marguerites and some long-stemmed Freesias are much finer in quality; the last are selling well.

REMARKS. Trade has been affected by bad weather and buying has been on a small scale generally, but at the time of writing there is a better tendency all round. One of the main features has been Cape Fruits, of which the quantities received this week have been rather large. The shipment consists mainly of Peaches, Nectarines, Pears, Plums and Grapes. Imported Apples are a quiet trade and prices are easier. A few Belgian Grapes are available, but they are feeling the competition with choice fruits from the Cape. Oranges are fairly plentiful, but the proportion of first quality produce is not high. A few English Apples are still being marketed, but unless really good are difficult to dispose of at satisfactory prices. Hothouse vegetables show an almost daily increase in quantity. Beans are cheaper; a few Peas from Guernsey are selling well. Asparagus is quoted lower and new Potatoes are selling freely at slightly lower prices. Cucumbers, mainly from the Worthing district, are now more

plentiful and their prices becoming more reasonable. Salads are arriving in large quantities from France and selling very well. Beans from Madeira are in good condition, but their prices are lower than for some weeks past. Trade in green vegetables is moderately good. Prices of old Potatoes remain firm for best quality tubers.

## GLASGOW.

A better tone prevailed in the cut flower market, and by the end of the week prices had almost, and in some cases fully recovered to their previous level. Tulips, which still constitute the chief supplies, were sold at the following prices:—Bartagan, Leotro, and William Pitt, 1/- to 1 6/8; Lucetia and Tea Rose, 1/- to 1 4; William Copland, 9d. to 1 4; Isis, 1/- to 1 3; Couronne d'Or, 10d. to 1 3; Flamingo and Prince of Austria, 10d. to 1 2; La Reue, 9d. to 1/-, and Murillo, 8d. to 1 1/2. The arrival of out-door-grown Daffodils has not affected values of the greenhouse products. King Alfred made from 1 4 to 1 9 per bunch, Emperor, Sir Watkin and Golden Spur, 10d. to 1/-, outdoor 4d. to 6d.; Glory of Lesse, 6d. to 1/-; ornatus, 7d. to 9d.; Henry Irving, 5d. to 7d.; and Narcissi, 3 6 to 4 6 per cane. Carnations were worth from 1/- to 5/- per dozen; Mimosa, 5/- to 6/- per cane; Lily-of-the-Valley, 2/- to 2 6 per bunch, and Lilac, 1 6 to 2/-; Lilium longiflorum (Harrissii) was cheaper at 8/- to 10/- per dozen; and English Violets were plentiful at 6d. to 9d. per dozen bunches.

The fruit market was quiet and featureless. First consignments of Sunkist Oranges from California realised 27/- per case, while Jaffa and Valencia Oranges were 1/- dearer for all counts. On the other hand, Apples were 3/- per barrel cheaper, but the value of case varieties remained unchanged. Porto Rico Grape Fruit was 2/- per case cheaper owing to its poor quality.

In the vegetable section prices of Cauliflowers ranged from 3/- to 4 6 per dozen; Cucumbers, 1/- to 1 3 each; Mushrooms, 2/- to 2 6 per lb.; Madeira Beans, 6/- to 8/- per box; Jersey Potatoes were down to 5d. and 6d. per lb. French Carrots realised 1 2 per bunch; Turnips, 1/-; Seakale, 2 6 to 3/-; Cress, 2 6 per dozen punnets; Syboes, 7d. per bunch; and Rhubarb, 36/- per cwt.

## THE WEATHER IN FEBRUARY.

Although relative humidity was high, the amount of precipitation during the month was slightly below the average. Distributed over fifteen days, the rainfall was 31.5 millimetres (1.24 inch), the most for one day being 22.2 of an inch on the 22nd. Of bright sunshine there was 68.1 hours, being a daily average of about 2 1/2 hours, and a percentage of 26, which is just under the normal for February. The brightest day was the 4th, with 8 hours to its credit, but on 9 days no sunshine was recorded. The mean temperature for the month was 39.90°, maxima and minima being 45.3° and 34.5° respectively. The extremes were 54° on the 16th and 26° on the 13th. On the grass 13 nights of ground frost were registered, the lowest reading of 19° being reached on the 11th and 12th. At one foot deep the soil temperature rose 4° during the month, standing at 42° at the end, which is comparatively high. The mean barometric pressure was 1014.3 millibars; highest on the 9th (1033.5 millibars) and lowest on the 23rd (983.5 millibars). Winds were chiefly south-westerly and moderate in force. Hoar-frost with morning mist was frequent. William McClelland, Training College Gardens, Mayfield, Dundee.

## SCHEDULES RECEIVED.

**IF THERE IS REAL QUALITY  
AND GOOD HONEST SERVICE**

behind your advertisements, they  
will pay, and pay handsomely, what-  
ever the initial outlay may be.

**SITUATIONS VACANT**

Twenty words (or three lines, including headline),  
4s., and 1s. for every succeeding eight words (or  
line or portion thereof). Fee for having replies  
addressed to this office, 1s. over and above the  
amount payable for all words appearing in the  
advertisement, including our own address.

Advertisers desiring their Advertisements  
repeated must give full particulars. Name and  
address alone are insufficient.

Gardeners writing to Advertisers of Vacant  
Situations are recommended to send them copies  
of testimonials only, retaining the originals.  
To part with original documents is to run a great  
risk of their being mislaid.

When addressing Box numbers, it is essential  
to give the initials or pseudonym as well as  
the correct number of the box.

**MUNICIPAL AND PUBLIC.**URBAN DISTRICT COUNCIL OF BRENTFORD  
AND CHISWICK.

SUPERINTENDENT OF BRENTFORD MARKET.

THE Council invite applications for the  
above appointment at their Market, Kew Bridge,  
at an inclusive salary of £400 per annum. Applicants  
must have had practical experience in the control and  
management of wholesale vegetable and fruit markets  
as well as a thorough knowledge of the keeping of books of  
account in connection therewith.

The successful candidate will be required (a) to pass  
satisfactorily a medical examination; (b) to reside within  
the district; (c) to contribute to the Council's super-  
annuation scheme; and (d) to be in attendance at the  
market during the prescribed hours of opening.

The appointment will be subject to three months'  
notice on either side.

Applications in candidates' own hand-writing, stating  
age and experience, with copies of not more than three  
recent testimonials, to be received by the undersigned  
not later than Saturday, the 19th day of March, 1927.

A list of duties will be furnished on application. These  
may be added to or varied at the Council's discretion.

FREDK. FERNHOUGH,

Clerk and Solicitor to the Urban  
District Council of Chiswick.

Town Hall,

Chiswick, W.4.

2nd March, 1927.

## SITUATIONS WANTED

Twenty words **2s.**, and **6d.** for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, **1s.**, over and above the amount payable for all words appearing in the advertisement, including our own address.

### SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.

## MUNICIPAL AND PUBLIC.

**ADVERTISER** seeks post as **HEAD GARDENER** or **SUPERINTENDENT** of Parks. Twenty-two years' experience in first-class private gardens; present position 8 years as Head with large staff. Landscape, sports grounds, tennis courts, hard and grass. Keen man and capable organiser of labour; excellent references as to character and ability; age 38.—X. Y., Box 41, 5, Tavistock Street, Covent Garden, W.C.2.

## PRIVATE.

**THE Lady Battersea** wishes to recommend C. BRIARS, **HEAD GARDENER** to the late Hon. Mrs. Eliot Yorke; thoroughly capable and competent, age 43. —C. BRIARS, Hamble Cliff, Netley, Hants.

**HEAD GARDENER,** experienced cultivation choice fruits, flowers, vegetables, general management of garden; previously Lyme, Weston Park, etc. recently Ireland.—MOORE, Haylane Farm, Foston, Derby;

## WHY NOT DAHLIAS

from SEED? A packet (say) of that section you like best? The result would be useful. The variability of the DAHLIA from SEED would make the issue attractive; and possibly a contribution to existing fine varieties. At 1/- per packet we are distributing seed saved from our own fine Collections of Decoratives, Paeony-flow'd, Singles; our new Bedders: Northern Gem and Northern Scarlet, also Coltness Gem, Ada, Dinkie. Sow in heat now. Flower this year. Complete Dahlia Plant Catalogue gladly sent.

**DICKSON & ROBINSON,**  
The King's Seedsmen, MANCHESTER.

Price List  
with Testi-  
monials from  
the makers:—

"The ONLY Economical Ones."

USED in the Royal and thousands of the Principal  
Gardens, GOLF and CRICKET GROUNDS, and  
exclusively at the Oval S.C.C.C. for past 20 years.  
OVER 10,000 SETS USED IN THE U.K.

Fig. 1, for Shod Horses.

Fig. 2, Wetted Boot.

HUNDREDS OF TESTIMONIALS.

The Field says: "As good as anything that could  
be devised."

Mr. Wm. Hardy (Gardener to Lt.-Col. Hon. W.  
Guinness): "The boots supplied 17 years ago are  
still in use and have always been satisfactory."

## SAREL'S PATENT SPIKED ROLLER.

COMM. HILLIARD,  
R.N., The All Eng-  
land Lawn Tennis  
Club, Wimbledon;  
writes: "The Sarel  
Roller is invaluable  
for aerating the  
ground. It saves an  
enormous amount of  
labour and is most  
beneficial to the  
turf. I should be  
very sorry to be  
without such a val-  
uable implement."

# CYCLAMEN

Awarded  
R.H.S. GOLD MEDAL

THE POPULAR GREEN-  
HOUSE PLANT.

The greenhouse Cyclamen now ranks as the King of the winter-flowering pot plants. If you have overlooked the previous opportunity of growing these valuable plants, now is the time to prepare for next winter's display by obtaining seed, seedlings, or plants in 60's. We are still in a position to supply plants in 48's in full flower for immediate decoration, price on application. Ask for a copy of our useful little Treatise. Our Catalogue is the most complete Cyclamen list published—a post card will bring you a copy.

## KNAP HILL NURSERY WOKING, SURREY (Late Anthony Waterer)

The Executors of the late  
**HOSEA WATERER**  
have pleasure in offering  
**HARDY RHODODENDRONS**  
for general purposes.

Without doubt the finest stock in the trade.

Named varieties, 2 to 6 and 8 ft.

**AZALEAS** in great variety, 2 to 5 ft.

**HARDY HEATHS**, in variety

**GOLDEN YEW**

A Magnificent Stock in all shapes and sizes from 2 to 10 ft.

**PRIVET**, common and oval-leaved.

**QUICK and HORNBEAM**, for Hedges,

**STANDARD TREES**

in great variety, consisting of

**LIMES, NORWAY MAPLES, ELMS, Etc. Etc.**

**EVERGREEN & DECIDUOUS SHRUBS**, viz.

Box, green and variegated, 3 to 8 ft.

Hollies, Common, 5 to 8 ft.

" Variegated and green varieties, 2 to 6 ft.

Thuopsis borealis, 10 to 12 ft.

Cupressus Lawsoniana, 12 to 14 ft.

Cedrus atlantica glauca, very fine, 14 to 16 ft.

Osmanthus, Phillyrocea, Spirocea,

Lilacs, Viburnums,

and a good general nursery stock.

Catalogues ready.

Inspection invited when it will be found well worth a visit.

## For Orchards and Fruit Trees.

Nitrate of Soda puts back into the soil what the trees take out—Nitrogen. Helps young trees to grow thrifty and strong; keeps old trees from losing their productiveness.

Read the special pamphlets, entitled "The Manuring of Orchards and Fruit Trees," "Successful Gardens for Every Amateur," supplied gratis and post free by THE CHILEAN NITRATE COMMITTEE, Priests House, New Broad Street, London, E.C. 2.

*Nitrate of Soda*

**SAFETY FIRST—  
FOR ANIMALS & PEOPLE**  
Non-caustic.

No smell; kills the roots superior to arsenical compounds.

For 4 gals. 1/-; 12 2/-; 25 3/6; 50 6/6; 100 12/- and bulk.

ALSO

**LETHORION**  
Nicotine Cone  
**FUMIGATOR**

Certain destruction to all pests in glasshouses

No. 1 — For 1,000 cubic feet — 10d.

No. 2 — " 1,500 " " — 1/3

No. 3 — " 2,500 " " — 1/9

Sold by all Nurserymen and Seedsmen

ORRY & Co., Ltd., Shad Thames, London, S.E.

## WILLIS BROS.' Garden Fertiliser

THE BEST ON THE MARKET.  
**NO STABLE MANURE REQUIRED.**  
For digging in or as a top-dressing. For kitchen Gardens or Herbaceous Borders.  
1 cwt., 15/-; 1/2-cwt., 9/-; 28 lb. 5/-; £14 10/- per ton. All Carriage Paid.

**LOOK TO YOUR VINES!**  
The Vine requires a large quantity of Potash for its proper growth and the development of fruit. WILLIS BROS. VINE MANURE contains 7% Potash, 22% Phosphate, and 4% Nitrogen, and the results justify us in saying it is the best on the market. The effect on old vines is very marked, it puts new life into them. 1 cwt., 25/-; 56 lb. 14/-; 28 lb. 8/- All Carriage Paid

**LAWN MANURE.**  
Having been connected with the experimental manuring of pastures, etc., for over 40 years, we are in the position to offer the above with perfect confidence as to results. It is especially suitable for poor mossy lawns, improving the texture of the grass, and helping the lawns to keep their colour in dry seasons. Can be used at the rate of 5 cwt. to the acre. 1 cwt., 20/-; 10 cwt., £9 15/-; 1 ton., £19. Carriage Paid. Special Prices quoted for Grass Manures for Park Land in quantities.

**LAWN SAND AND DAISY KILLER.**  
This preparation will be found very effective for thickening the sward and encouraging the grasses; also destroys the daisies and other weeds so troublesome on lawns. 1 cwt., 25/-; 10 cwt., £12. Carriage Paid. DIRECTIONS FOR USE.—Sprinkle thinly over the surface of the lawns at the rate of 4 to 6 ozs. to the square yard; where a mass of weeds occurs a little more may be used, as the grass cannot get through until the weeds are killed. A dry day in autumn or spring is the best time to apply the LAWN SAND.

**SUSSEX TRUG BASKETS.**  
18" 4/-; 20" 5/-; 23" 6/-; 26" 7/-; 28" 8/-; each. Carriage Paid.

**GARDEN SUPPLIES AT LOWEST PRICES.**  
Write for our List of Garden Manures and Horticultural Sundries. Free on application.

# SUTTON'S SEEDS

## ANNUALS

The popularity of these beautiful, yet, simple flowers for garden adornment continues to increase and there are few gardens in which they may not now be found. Their wide range of colour and diversity of form and habit make Annuals peculiarly suitable for the modern style of gardening. Flower-lovers who have once grown them continue to do so in a greater degree than ever, while those who have not, as yet, given them a place in their garden, have before them the opportunity of planning many beautiful and harmonious colour schemes for their beds and borders during the coming summer.

*Complete descriptive list of Sutton's Annual and other Flower Seeds, Vegetable Seeds, Seed Potatoes, etc., will be found in the pages of our Garden Seed Catalogue for 1927, a copy of which will be forwarded on application.*

**SUTTON & SONS, The King's Seedsmen, READING.**

## RANSOMES' LAWN MOWERS

*"The Best in the World."*

### "MARQUIS"

The most perfect cutting and easiest running Roller Mower obtainable. Fitted throughout with self aligning ball bearings in dust proof housings.

Also MOTOR, HORSE, PONY and DONKEY MACHINES

Write for List No. 99 to—  
**RANSOMES, SIMS & JEFFERIES, Ltd.**

Orwell Works, IPSWICH.

Obtainable from all Ironmongers and Seedsmen.

## BRITISH CARNATION SOCIETY

### ANNUAL SPRING SHOW

TO BE HELD AT

Royal Horticultural Society's Hall  
Vincent Square, S.W.

**Tuesday & Wednesday, March 29 & 30**

Doors open Tuesday 12.5 p.m., Wednesday 10.5 a.m.

**GRAND DISPLAY OF CARNATIONS** by the leading Trade, Professional & Amateur Growers  
**"DAILY MAIL" £100 GOLD CUP** for the Best Scented Carnation.  
Also **SPECIAL PRIZES** and **CHALLENGE TROPHIES** VALUED £1,000.

**ILLUSTRATED LANTERN LECTURE** by Montague C. Allwood, F.L.S., at 3 o'clock, on Wednesday, March 30, followed by a **CARNATION CONFERENCE** by the leading growers.

**Admission Free to Members—Non-Members 2/6**

Schedule, etc., from P. F. BUNYARD, Hon. Sec.  
57, Kidderminster Road, Croydon.

## TURF, FIBROUS MOULD and LOAM

Prepared cultivated turf for best lawns, bowling greens, tennis courts, etc.

Also **OLEAN MEADOW TURF** FOR PLAYING FIELDS.

Large or small quantities supplied. Enquiries and inspection invited.

**FROGLEY'S — HODDESDON — HERTS.**

## SUPPLEMENT PLATE.

Copenhagen Municipal Gardens.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 42° 5'.

## ACTUAL TEMPERATURE—

The *Gardeners' Chronicle* Office, 5, Tavistock Street, Covent Garden, London, Wednesday, March 16, 10 a.m. Bar. 30.4. Temp. 50°. Weather, Sunny.

ONE of the chief glories of the English garden is the lawn; verdant alike in summer and in winter, close mown and weedless and free from slippery Clover. But that glory is, if not departing, at least suffering from some temporary eclipse. Neglect in war years has not yet been made good—for the harvest of garden work is plentiful and the labourers are . . . expensive. Wet winters have been prolific in the production of moss, and Daisies and Plantain thrive on neglect. It therefore behoves us who have lawns to tend to consider whether there may not be ways of making them perfect once more without the aid of too much labour. American golfers have, it appears, solved the problem of the perfect golf green, and their discoveries may, perhaps, prove useful to us, for it would never do for our pleasant lawns as well as our art treasures to be exported to the United States! The American green-keeper has discovered as the result of experiment, that the perfect golf green

of short, crisp, weedless and wormless grass can only be secured if the soil be made thoroughly acid. Whereas most garden plants flourish only in a soil round about the point of neutrality—neither acid nor alkaline—the grasses most favoured in America (species of *Agrostis*) are only happy when the soil is well on the acid side. To make the soil acid, recourse is had to successive and heavy dressings of those fertilisers which leave acid residues in the soil. In fact, according to this teaching, you do for the grass of lawns exactly the opposite of that which should be done for the garden at large. No lime on the lawns, for that would encourage neutrality of soil and also the growth of Clovers; but fortnightly dressings at the rate of one hundredweight or one-and-a-half hundredweight to the acre of sulphate of ammonia or an equivalent amount of ammonium phosphate. Whereas, however, a liberal dressing of sulphate of ammonia, even for so greedy a crop as the Potato, amounts to say three hundredweights of sulphate of ammonia per acre, the lawn as treated by the American green-keeper may receive in fortnightly doses three or more times that amount. The heavy dressings are put on mixed with a fine, loamy compost, and in this condition the fertiliser must be watered in. As a result of this treatment all those flowers of poverty which we call weeds find life on the lawn no longer worth living. They disappear and along with them go also the lawn's worst enemy, the earthworm, and thus in spite of excess of nitrogen and apparently because of high acidity, the grasses have the lawn all to themselves, and golf secretaries must enjoy a sinecure in the profession of confessors of complaining putters—no Clover, no earthworms, no weeds, and as we may suppose, every hole always holed out in one. Whether these interesting observations can be applied successfully in this country remains to be seen. Experiments of a similar kind made on Canadian golf courses are said to have given promising results. Any ordinary cultivator would naturally expect that such heavy dressings of sulphate of ammonia or of ammonium phosphate would result in extraordinarily rank growth of grass which would make the work of mowing harder even than it is in this country. And, indeed, that may prove to be the case; but our contemporary, *Golfing*, which has published recently an interesting series of articles on the American method, is encouraging experiment on similar lines, and others also who are interested in the subject are giving it a trial. When the results are available, we shall hope to report them to our readers, for if they are favourable, the method should prove one which will give us better lawns at a cost less than that involved in their present maintenance, though that would seem almost too good to be true.

**Centenary of the French National Horticultural Society.**—In view of the approaching International Horticultural Exhibition in Paris, with which the French National Horticultural Society is celebrating the centenary of its foundation, it may be of interest to trace briefly the history of this Society, which has attained at the present day to a position of such eminence and authority. It was on June 16, 1827, that a little band of French horticulturists, scientists and garden-owners, all animated by a desire to improve methods of cultivation and to promote the interests of horticulture in general, met to talk over the possibilities of establishing a Society, and on the 6th of the following month, July, a general assembly approved the plans made by the

provisional committee, and formally created the Society by the name of Société d'Horticulture de Paris. There were, to begin with, about four hundred members, among whose names there are many of historical and horticultural interest—the Duc d'Orléans, Baron de Rothschild, Achille Richard, the botanist; Vibert, the Rose-grower; Vilmorin, of the celebrated firm now at Paris and Verrières. The establishment of the Society was celebrated by a re-union which took place on the 30th August, 1827, on the lovely estate of the Chevalier Soulange-Bodin, at Ris (Seine-et-Oise), to which were invited all the best authorities and most celebrated notabilities of the time in science and art. The Society quickly gained prestige, and was smiled upon by the Government and by the Paris municipal authorities. M. Soulange-Bodin was elected General Secretary, and showed his enlightened interest in the cause of horticulture by offering a prize of 400 francs to be awarded to the discoverer of a method of destroying the larvae of the cockchafer. The first annual meeting took place on August 29, 1828, under the presidency of the Vicomte de Martignac, Minister of the Interior, and in 1830 the Society launched out into a programme of annual exhibitions, in which not only members of the Society, but growers from the environs of Paris and from all parts of France should be invited to send plants for competition. The first of these exhibitions took place in 1831, on the 13th and 14th of June, in the Orangery of the Tuileries. It was a great success, and had an excellent effect in stimulating the growing interest in matters horticultural which marked that particular period. In 1834, another innovation took place in the form of a winter exhibition, held on the 2nd of March, in the St. Jean Hall, at the Paris Hotel-de-Ville, at which forced plants of various kinds were shown. During the early years of the Empire, the Society languished somewhat, in spite of the Prince Napoleon having been nominated its "protector," and the name having been in consequence altered, in 1853, to Société Impériale d'Horticulture de Paris. By this time, horticultural Societies had sprung up in great numbers all over the country, and in Paris itself the original Society had a formidable rival in a group formed in 1841, which at first called itself merely "Cercle Général d'Horticulture," but which assumed in 1848 the title of "Société Nationale d'Horticulture de la Seine." In 1854, the two societies wisely amalgamated under the title of "Société Impériale et Centrale d'Horticulture," and in 1855 had a triumphant success in an International Exhibition which was held, from May to October, at the Champs Elysées. In 1860, the combined Society made a further step forward in constructing the premises which it still occupies at 84, Rue de Grenelle. During the war of 1870-1, and for some years afterwards, the Society suffered from the general depression prevailing throughout the country, but gradually recovered and resumed full activity. In 1885, the title was altered to the one it now holds, Société Nationale d'Horticulture de France; the Society became increasingly successful, and had already published innumerable horticultural monographs on various subjects. The Great War of 1914-18 found the Society in the plenitude of its power and influence, and though its operations were of necessity largely suspended, or altered in character, they have now been completely resumed, and the Society ranks second to none in importance. This short survey of a few of the principal events in the life of the Society naturally omits much that is of prime importance, but is sufficient to give some idea of the varied nature of its activities. Since 1926, the President has been M. Fernand David, formerly Minister of Agriculture; the General Secretary is M. Alfred Nombrot; and the Secretary-Editor, M. Guillaumin.

**Copenhagen Municipal Gardens.**—In our issue of October 16, 1926, we gave an account, with illustrations, of the Copenhagen Municipal Gardens, and we now present our readers with a Supplement Plate illustrating another example of the horticultural enterprise shown by the municipal authorities of the Danish capital.

**Trial of Early-flowering Chrysanthemums.**—The Cheshire School of Agriculture, Reaseheath, Nantwich, carried out a series of trials last year with early-flowering Chrysanthemums for commercial purposes. All the varieties were grown undisbudded, except for an individual plant here and there, and Mr. W. E. Shewell-Cooper, who conducted the trials states that he leans "towards the assumption that the time and labour spent on disbudding runs away with any profits that may accrue through the disbudded flower." Varieties which were outstanding in the trials were Hotspur, an early-flowering crimson variety with a gold reverse, of dwarf-growing habit, very suitable for bunching; Berengaria, a good pink sort, somewhat similar to Shirley Pride; Phoenix, a light bronze coloured variety with slightly Cactus-shaped flowers, which was tried for the first time in 1925, and gave such good results as a market variety that it was again tried in 1926, for it is an excellent grower and promises to become a favourite for bunching; Bronze Early Buttercup, which is also said to be a good spray variety and sells well; Brightness, a light crimson sort, the general favourite in the collection, as adjudged by the remarks of commercial visitors to the gardens; Crimson Circle, a dwarf variety which is in good demand for early bunching; Pink Dame, which was regarded as the best early pink variety in the trial, and found a ready sale amongst local florists; H. M. Carr, a primrose-coloured September White and said to have all the good qualities of that variety; Janet Wyper, an excellent, early-flowering variety, about two feet tall, with creamy-white flowers on long stems; Mrs. Jack Pearson, an early bronze variety, useful for bunching or garden decoration; R. A. Roots, a very strong-growing white variety, "quite worth recommending,"; and Fireflare, an early flowerer, the light bronze blooms being produced on long stems, "a sort that bunches well." During the coming season a trial of new varieties and novelties as advertised in the various Chrysanthemum raisers' catalogues for 1927, will be undertaken under the auspices of the Cheshire School of Agriculture.

**Display of Dutch Tulips in Hyde Park.**—In the House of Commons Sir H. Brittain recently asked whether any special efforts were being made this year in the way of additional flora and fauna for the beautification of the London parks. Captain Hacking, Under-Secretary to the Home Office, said that the Office of Works was making arrangements for displays on the same lines as in previous years. In addition, there would be a special display of Tulips due to the generosity of the Dutch Bulb Growers' Association. We are informed that this remark refers to a large collection of Tulips presented to H.M. Office of Works by the combined bulb growers' organisations of Holland. The bulbs were planted last autumn in Hyde Park, near Victoria gate, in the large border. The collection consists of 55,000 bulbs belonging to the Darwin, Breeder, Cottage, Rembrandt and Lily-flowered groups. There are over one hundred varieties of Darwin, about fifty Breeder, seventy-five Cottage, ten Rembrandt and four Lily-flowered varieties. The selection will afford a very good idea of the various groups, and a comprehensive review of the best representatives of each group. Sir Daniel Hall has written a short history of the introduction and development of the Tulip which will be exhibited at the border when the Tulips are in flower. The combined Dutch bulb growers' associations have organised large displays of flowering bulbs, planted in public parks in various countries, and these have proved to be excellent and efficient advertisements for the varieties thus shown to the flower-loving public. The character of such advertisements is absolutely neutral, the sole object being to push the general use of the bulbs displayed, without any preference to special firms; such demonstrations consequently are not only to the benefit of bulb producers as a whole, but also to those firms who sell the bulbs retail.

**Botanical Legacy to a Free Library.**—The late Sir E. Thomas Holden, J.P., of Glenelg, Great Barr, Staffordshire, who died on November 13 last, aged ninety-five, bequeathed his collec-

tion of Mosses and plants and his books on Mosses for the Reference or Natural History Department of the Walsall Free Library, to which institution he also left £100 for the purchase of books of a scientific character.

**American Iris Society.**—We learn that Mr. J. B. Wallace, junr., 129, Church Street, New Haven, Conn., U.S.A., has been appointed Secretary of the American Iris Society, which has now a thousand members.

**Mr. Heber Clark.**—One of the oldest of the bulb-growing businesses at Spalding is the one carried on by Mr. Heber Clark, at Clay Lake Bulb Farm, and established by his father. Mr. Clark is a successful cultivator and fairly large forcer of Daffodils, one of his houses containing no fewer than 50,000 Golden Spur early this season. Mr. Heber Clark was a great friend of the late Mr. James K. Ramsbottom, with whom he studied the scientific aspects of bulb cultivation, particularly in connection with the elimination of eelworm disease. Like many other growers, he readily acknowledges the debt he owes to Mr. Ramsbottom's investiga-

MR. HEBER CLARK.

tions in regard to the diseases of bulbs. Mr. Clark considers that finer results are obtained by forcing Daffodils that have been grown in heavy soil than from bulbs grown in light soil, and has proved his opinion by an experience extending to twenty-five years.

**Centenary Exhibition at Antwerp.**—During the coming year, 1928, the Antwerp Royal Horticultural and Agricultural Society will be celebrating its centenary, and it is intended to mark the occasion by holding an important horticultural exhibition. It has been decided to arrange the exhibition in September so that it may not clash with the Ghent Quinquennial Florales, which will be held in the spring of the same year.

**British Mycological Society.**—The following programme has been arranged by the British Mycological Society for the London Meeting to be held in the Botanical Department, University College, Gower Street, on Saturday, March 19, 1927, at 11.0 a.m. The speakers and subjects are: Mr. W. R. I. Cook, "Influence of Environment on Infection by *Ligniera Junci*"; Mr. E. H. Ellis, "Fungi in Japanese carvings"; Mr. E. Wyllie Fenton, "Seed Mixtures and the Incidence of Fungal Diseases"; Miss M. P. Hall, "Zoning in cultures of *Monilia fructigena*"; Mr. K. R. Mohendra, "Varieties in *Sphaeropsis malorum*"; Mr. J. Ramsbottom, "Fragmenta Mycologica VII." Lunch will be arranged in the College Refectory.

**Scholarships for Agricultural Workers.**—The Government has decided to continue the scheme of scholarships for the sons and daughters of agricultural workmen and others, which was approved in 1922 for a period of five years and concluded last year, in a slightly modified form, as recommended by the Central Committee, and the first awards under the revised scheme will be made this year. There are two main grades of scholarship, namely, Junior Scholarships for short courses in agriculture, horticulture, dairying or poultry-keeping, at farm institutes, and Senior Scholarships for diploma or degree courses in an agricultural or allied subject at agricultural colleges or universities, or for courses in veterinary science at veterinary colleges. The normal avenue to the Senior grade is through the Junior grade, but an exception is made in the case of candidates who have passed a higher school certificate examination before the age of seventeen, or a higher school certificate examination with distinction in at least one subject before the age of eighteen. Such candidates may apply for Senior Scholarships (honours degree courses) without passing through the Junior grade. Candidates must be (a) sons or daughters of agricultural workmen, or of working bailiffs and small-holders whose means are comparable with those of agricultural workmen; (b) bona fide workers in agriculture; (c) sons or daughters of rural workers whose means and methods of livelihood are comparable with those of agricultural workmen. The value of the scholarship is such as will enable students to attend the courses without cost to their parents. Provided a sufficient number of suitable applicants is forthcoming, there will be awarded this year about 120 Junior Scholarships, ten Extended Junior Scholarships (for well-qualified candidates who have held Class III. scholarships under the experimental scheme), and ten Senior Scholarships. The closing date for the receipt of applications is April 30, 1927. Forms of application and full particulars may be obtained from the Secretary, Ministry of Agriculture and Fisheries, 10, Whitehall Place, London, S.W.1, or locally from the offices of County Councils.

**Association of Economic Biologists.**—The Association will visit the Galleries and Laboratories of the Imperial Institute, South Kensington, on Friday, the 25th inst. Guides will meet the members at 2.30 p.m. at the entrance to the Offices of the Institute at the west end of the building (near Queen's Gate). Tea will be served in the Conference Room of the Imperial Institute at 4.30 p.m. The Council will meet at 2 p.m. in the Conference Room at the Imperial Institute. The May meeting of the Association will be held at the Imperial College, South Kensington, at 2.30 p.m., on the 13th: Subject, "Plant Alkaloids," by Lieut.-Col. A. T. Gage, C.I.E., Dr. T. A. Henry, and Dr. J. Trevan. The June meeting will be held at the South-Eastern Agricultural College, Wye, on the 17th and 18th.

**Conference on Cultivation.**—A conference on "Cultivation: What the Farmer Aims at and How he does it," will be held at the Rothamsted Experimental Station on Tuesday, March 22, 1927, at 11.30 a.m. The chair will be taken by the Rt. Hon. Lord Bledisloe, K.B.E., Parliamentary Secretary to the Ministry of Agriculture and Fisheries. The speakers and subjects include Mr. H. Drewitt, Colworth, Chichester, "Cultivation on the West Sussex chalk and brick earth"; Mr. John Joyce, Preston Bowyer, Taunton, "Spring Cultivation in Western England"; Mr. J. H. Spilman, Gardham, Beverley, "Cultivation Operations on the Yorkshire Wolds"; Mr. J. Steel, Burnawne, Rochford, "Spring Cultivation in an Eastern County"; and Dr. B. A. Keen, Rothamsted Experimental Station, "Cultivation: The Art and the Science." Arrangements will be made to provide visitors who notify the Secretary, Rothamsted Experimental Station Harpenden, with luncheon at a charge of 3s.

**Experiments with Vita Glass.**—Corresponding series of plants and flowers will be grown this summer at University College, Southampton, and at the Royal Gardens, Kew, to test for greenhouse and garden frames the new type of

glass which, unlike ordinary window glass, admits the ultra-violet rays of the sun. At Kew the authorities have decided to equip half an experimental greenhouse with the new glass and half with ordinary glass, and a typical selection of plants and flowers will be duplicated in each section. A similar course will be followed with a wide variety of plants, including Radishes, Sunflowers and Beans, in the large glass corridor with a southern aspect, fronting the new botanical research laboratory at Southampton, which has cost £5,000. The aim of both experiments is to find out whether it is possible by the use of Vita glass, to obtain any such advantages as earlier cropping, better quality, heat saving, better colour, harder constitution, and greater resistance to disease in plants.

**Garden Scheme on behalf of Queen Alexandra's Memorial.**—A large and interesting scheme to garden lovers is being inaugurated by the Women's Committee of the National Memorial to Queen Alexandra all over England and Wales.

Oak wood adjoining the main road from Bourne-mouth to Southampton. Most of the trees are English Oaks upwards of two hundred years old, and already some of them have been felled. In reply to strong protests the Commissioners seem to have stayed their hand for the moment. In an attempted justification of their action the Commissioners are stated to have explained that the trees they intended to fell were "mature timber," and that the felling was to be carried out in the usual course of forestry arrangement. Against this the Commissioner was reminded that the Act of 1877 expressly provided that "The ancient ornamental woods and trees in the forest shall be preserved," and that the Commissioner of Woods and Forests, in 1882, definitely pledged his department that "Burley Old should not be treated as a plantation in the common acceptance of the term," and that only dead trees and those far advanced in decay should be cut down. At the inquiry now held it was stated that the intention was to preserve a fringe of old trees by the road-

their territories leads us to entertain a sanguine hope, the vegetation of India will be much more accurately known than that of any part of the world, beyond the limits of Europe, if we except the north-eastern parts of America. The importance of this knowledge to manufacturers, merchants, engineers, and commercial men of all descriptions, was becoming more and more apparent, even before the late Exhibition of all Nations; and now presses with great additional force upon the consideration of those to whom the welfare of India is confided. Dr. Hooker has also in preparation the Floras of New Zealand and Van Diemen's Land, to be published under the authority of the Admiralty. Instructions have been given for the immediate preparation of these works uniformly with the Antarctic Flora, concluded in 1847. Enormous materials for the purpose have gradually accumulated, among the most important of which are those collected by Dr. Hooker himself; to which have to be added the collections of Banks and Solander in Cook's first voyage

FIG. 92.—ODONTIODA FREDERICK J. HANBURY.

R.H.S. First-Class Certificate and Lindley Medal, March 8. Flowers reddish-scarlet and dull yellow. Shown by Messrs. J. and A. McBean. (see p. 184).

In other hands the scheme has spread to Scotland and to some parts of Ireland. During the Whitsuntide holiday, from May 30 to June 11, inclusive, garden lovers are being asked to open their gardens at a small charge. Owners are responding most generously, and it is expected that nearly all notable gardens will be opened. In due course the Memorial Committee will announce a full list of these gardens, and the facilities for visiting them.

**Bequests to a Gardener and a Gardener's Widow.**—The late Mr. George Elliot Meakin, of Creswell Manor, Stafford, left the sum of £100 to his former gardener, Mr. William Foulkes, and £100 to the widow of his late gardener, Mr. John Wilkes.

**The Preservation of Burley Wood in the New Forest.**—Great concern is being felt amongst many lovers of the New Forest on account of the recent decision of the Forestry Commissioners to fell practically the whole of the ancient trees in Burley Old, a splendid old Beech and

side, but the deputation claimed that the whole of Burley Old Wood should be preserved, as the majority of the trees are considered to have another century-and-a-half of beauty.

**Appointments for the Ensuing Week.**—TUESDAY, MARCH 22: Royal Horticultural Society's Committees meet (two days); Wimbledon Gardeners' Society's meeting. WEDNESDAY, MARCH 23: Sheffield Chrysanthemum Society's meeting; Pangbourne and District Gardeners' Mutual Improvement Association's lecture. FRIDAY, MARCH 25: Association of Economic Biologists meeting.

**"Gardener's Chronicle" Seventy-five Years Ago.**—Dr. Hooker's *Herbarium Specimens*.—We have no little satisfaction in announcing that the Government has commissioned Dr. Hooker to arrange, name and distribute the valuable collections of dried plants made by him in the Sikkim-Himalaya and other parts of India. Should the East India Company enable Dr. Thomson to do the same, of which their well-proved desire to promote science within

(1770), and of the Forsters in Cook's second voyage; the plants of Menzies procured in Dusky Bay; the collections of the brothers Cunningham at the Bay of Islands, in 1842; very extensive collections formed by Colenso, Bidwill and Dieffenbach, who alone have reached the mountains and lakes in the interior of the Northern Island; materials obtained at the Bay of Islands and on Banks' Peninsula, by Raoul, during the voyage of the French frigate L'Aube, and numerous minor contributions. *Gard. Chron.*, March 20, 1852.

**Publications Received.**—*Successful Gardens for Every Amateur*.—Published by the Chilean Nitrate Committee, Friars House, New Broad Street, E.C.2., from whom copies may be obtained free, on application.—*A Botanist in the Amazon Valley*, by R. Ruggles Gates; H. F. and G. Witherby, 326, High Holborn, W.C.1; price 7/6 net. *Manual of Cultivated Trees and Shrubs Hardy in North America*, by Alfred Rehder; Macmillan and Co., Ltd., St. Martin Street, W.C.2. Price, 42/- net.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Dendrobium Phalaenopsis and Allied Genera.**—There are several members of these Orchids which thrive under the same conditions, all of which are most useful plants, with flowers of distinctive colour. *D. Phalaenopsis* is the most widely-grown species of the genus; *D. superbiens*, *D. bigibbum* and several others produce their flowers in the autumn months, when their long sprays of flowers are valuable. *Dendrobiums* inhabit some of the hottest parts of the world, hence they should be grown in the warmest house the whole year round. The plants will grow either suspended from the roof or on the plant stage, but as they require all the light possible, I prefer to suspend them. Whatever receptacles are used, they should be only large enough to just accommodate the plant. So soon as fresh root-action takes place, any necessary repotting should be done, but if the rooting-material is in good condition the plants should not be disturbed. In potting these Orchids half fill the receptacles with clean crocks and arrange the plants so that the bases of the young growths are level with the rim of the pot. The pseudo-bulbs should be tied neatly to stakes to prevent swaying, and should they be infested with insect pests, take measures to eradicate these whilst the plants are out of their receptacles.

**Compost.**—A suitable rooting-medium for these Orchids consists of three parts *Osmunda* fibre and one part *Sphagnum*-moss cut into rather short portions, with sufficient crushed crocks to ensure a free passage of water. Pot firmly, as this material will hold water much in the way of a sponge if placed in the receptacle loosely. After repotting them, the plants should be watered carefully until the young roots have entered the new material freely, after which they will require liberal supplies of moisture, and frequent sprayings with soft, tepid water. During their season of growth these Orchids enjoy plenty of atmospheric moisture, and will only require shading from bright sunshine during the hottest part of the day. The plants may be grown satisfactorily in a *Croton* house, or one of a similar nature.

### THE KITCHEN GARDEN.

By E. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTON, Honsley Hall, Gresford, N. Wales.

**Turnips.**—It is yet early to sow Turnips outside in quantity, but a small sowing may be made on good ground in a sheltered position, to follow those that are growing in frames. Early Milan, Little Marvel and Snowball are suitable varieties to sow at this season. Thin the young plants early and keep them dusted frequently with old soot.

**Aubergines.**—Sow seeds of Aubergines in a warm house, and grow the plants either in pots or boxes. Maintain a temperature of about 55°. Keep the plants well syringed on warm days or thrips will quickly put in an appearance. So soon as the young fruits commence to swell, feed the roots on frequent occasions with liquid manure.

**Tomatos.**—If seeds of a suitable variety are sown now, in a warm house, and the young plants potted finally into five-inch or six-inch pots, and well hardened, they will be ready for planting outside by the end of May or early in June.

**Peas.**—Plants that were raised in boxes as advised earlier in the season, and are now well hardened, should be planted on a warm, sheltered border. The soil should be in a suitable working condition. When planting, the drill

or trench should be made sufficiently deep so that the roots are not cramped. Place the plants about two inches apart, and allow a distance between the rows of rather more than the height of the variety. When planted, draw a little of the fine soil on either side of the rows and place twigs for support. These will also help to shelter the young plants from cold winds. Keep a sharp watch for sparrows, and if these birds are very troublesome it will be well to net the bed.

**Carrots.**—Seeds of early, stump-rooted varieties should now be sown in well-pulverised soil on the early border, to provide a succession of roots to those growing in frames. So soon as the seedlings appear, dress the ground lightly with old soot as a deterrent to slugs; the soot will have a stimulating effect on the growing plants.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brocket Hall, Hertfordshire.

**Begonia Gloire de Lorraine.**—Plants of this *Begonia* that were cut down as previously advised, should by this time have developed good, strong shoots from their bases. Basal cuttings undoubtedly make the best plants, and if these are not sufficiently advanced it will be wise to allow them to grow longer, rather than propagate weak, top growths. This *Begonia* may also be increased from leaves, but this method is somewhat slow, and I see nothing to recommend it. The cuttings, when available, should be severed with a sharp knife and inserted several together in a small pot containing a mixture of loam, leaf-mould and a little peat, with sufficient sand and small charcoal added to keep the compost open. The cuttings should be stood in a propagating frame, for preference on a mild hot-bed of leaves, where a temperature of 65° to 70° may be maintained. It is desirable to remove the light every morning for a short time to allow the condensed moisture to disappear, after which it should be replaced. Other varieties of this section of *Begonias*, such as *The King*, *Turnford Hall* and *Mrs. Peterson* require similar treatment.

**Winter-flowering Begonias.**—*Begonias* of the *Mrs. Heal* and *Optima* type should now be encouraged to produce good, strong shoots which are to be used for propagating purposes. The old stools may be watered a little more freely than hitherto, but at the same time with discretion. Fumigate the plants, as previously advised, several times immediately they show signs of active growth, especially where mite was troublesome last season, but in any case it is wise to start with clean stock.

**Hybrid Calceolarias.**—These plants should not be allowed to become starved in their pots. No stimulant is more suitable for these plants than liquid manure, which may be used on alternate waterings.

**Winter Pelargoniums.**—Cuttings of Zonal *Pelargoniums* for winter flowering should be obtained with as little delay as possible. They may be placed singly in small pots or several around the sides of a larger receptacle, provided the roots are not allowed to become an entangled mass before potting the plants singly. The cuttings should be inserted and made firm, and the pots afterwards placed on a shelf in gentle warmth, but free from excessive atmospheric moisture; failing this they should be stood in the warmest part of the house. To obtain large, stocky specimens, the plants should be pinched several times during the summer; to obtain extra large specimens some of the old plants should be retained, cut back, and encouraged to break into new growth, after which they should be potted on. During the summer all flower-buds should be removed and the growths pinched to promote a stocky habit. Summer-flowering *Pelargoniums* should be kept growing with as little fire-heat as possible. Feed the plants with liquid manure, and fumigate or spray them with an insecticide to keep green fly in check.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Late Orchard Houses.**—Houses containing a mixed collection of late trees will soon present an interesting appearance, especially where flower buds are plentiful. If Pears, Plums and Cherries are grown, hard forcing should not be attempted, but the house ventilated liberally, day and night. A good crop is best ripened under the influence of summer heat. A temperature ranging from 43° to 48° at night and 55° to 60° by day, with plenty of air, will bring forward the perfectly-formed blossoms, which will set freely without fire-heat, but a little artificial warmth should be available to ensure a buoyant atmosphere. The trees should be watered carefully and syringed regularly on fine mornings until they come into flower. When this stage is reached, a dry atmosphere, a low night temperature, and a somewhat brisk heat with a free circulation of air by day will be favourable to fertilisation. Daily attention with the brush will aid pollination, and when the fruits have set, syringe liberally and close the ventilators early. The house should be well fumigated before the trees come into flower.

**Melons.**—Although the winter has, on the whole, been mild, young Melon plants have not made much progress, therefore the best method of meeting failures is to put in a few fresh seeds at short intervals. After this date the plants will make good progress; their requirements are a steady bottom heat of 80°, a temperature ranging from 66° to 70° at night and 75° to 85° by day, a moderate amount of atmospheric moisture, a little ventilation when the weather is favourable, and careful watering. The compost should consist of fairly heavy loam made porous to the passage of water by the addition of old lime rubble and a little charcoal. The growing of cordon Melons is as simple as growing Tomatos; all stem laterals are removed up to the first wire of the trellis and the shoots pinched at the first leaf onward until female flowers are plentiful. When these are ready to open, pinch the point out of the main shoot and pollenate each flower. Laterals bearing the young fruits should be stopped at the first joint beyond the fruits, when two or three of the latter of uniform size should be selected for the crop. Support the Melons by nets as they increase in size, and carefully preserve every old leaf from injury, pinching all remaining laterals to prevent crowding. To maintain a continuous supply of ripe fruits, two or three small compartments are necessary, and a succession of young plants always ready to be planted as the last fruit is cut.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD,  
Wrotham Park, Barnet, Middlesex.

**Autumn-fruiting Raspberries.**—The canes, if not already shortened, should be cut down to within a few inches of the ground. Work the soil between the rows and at the same time dig up any suckers that are not required. When this has been done, apply a mulch of manure. Autumn-fruiting Raspberries need liberal treatment to obtain the best results, and more especially if the land is light and porous. Plants growing on land in good heart and of a rather heavy texture should be mulched with leaf-soil, which will serve to keep the roots moist during the summer.

**Arrears of Work.**—All arrears of planting and pruning should be completed as early as possible. Both Pears and Apples promise to develop plenty of blossom, and the buds are large and plump, though quite forward enough owing to the very mild weather of the past few weeks. Varieties of Pears are numerous, and to keep up a long supply of good fruits, suitable sorts should be chosen for planting. To obtain the best results, late varieties should be grown in good positions and given ample moisture at the roots in hot, dry seasons. Liquid manure, supplied liberally at intervals to all trees bearing heavy crops of fruit, will not

only help to increase the size of the individual fruits but prove very beneficial in building up stronger buds for the following season's crop. Early varieties may be grown in much cooler positions as bush specimens. Espalier trees and those growing against west and east walls should have heavy mulchings of manure placed over the roots, especially if the soil is of a light, porous character, and when the crops are heavy.

**Morello Cherries.**—These trees having been pruned, trained and put in order generally, should receive attention at the roots. A certain amount of the old soil should be removed from above the roots and a rich top-dressing applied. Plenty of lime, bone-meal or some other concentrated manure should be mixed with sweet fibrous loam in preference to using decayed farmyard dung as a dressing for these Cherries.

**Blackberries.**—These fruits are well deserving of more attention than they usually receive and should be grown more extensively where soft fruits are in demand. The berries are very serviceable for making jam, jellies and tarts. The plants may be grown against walls, fences and poles. A good plan is to grow and train them on stakes several feet high, cut away all the old canes which have borne fruits each year, and train in the young shoots to fruit the following season. There are several useful varieties in commerce. The Veitchberry is a splendid sort, and should not be overlooked by those about to plant.

### THE FLOWER GARDEN.

By JOHN COURTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Polyanthus and Auricula.**—The many fine strains of these popular flowers are valuable for furnishing a display of colour during the spring in beds or borders, either alone or interplanted with spring-flowering bulbs. They are also very charming used in more informal ways; for example, as an under-planting in big beds of deciduous shrubs, or in large, informal drifts in thin woodland, the partial shade and shelter they obtain in such situations suiting them admirably. The seeds should be sown now, in pans or boxes, which should be placed in a cold frame and kept shaded until germination takes place. When large enough to handle, the seedlings should be pricked off into boxes of rich soil, and later hardened and planted out in the reserve garden in rich, well-manured ground. In the south, at least, it is an advantage to grow them in partial shade during the hottest part of the day. During spells of dry weather it may be necessary to afford them water at the roots.

**Cowslips and Blue Primroses.**—Seeds of the Cowslip should also be sown now, and the plants treated in the same way as advised for Polyanthus. Blue Primroses should be raised from seeds of a good strain. These are very charming planted in the partial shade of bushes or in thin woodland. In the immediate neighbourhood of London they do not seem to be a success, as the deleterious atmosphere seems to affect the colour, and this, I have no doubt, is true in the neighbourhood of other large towns.

**Pentstemons.**—Young stock in cold frames should now be lifted and potted, returning the plants to the frames until they are re-established at the roots. Towards the end of the present month they may be stood out-of-doors. Where time and space does not permit of treating the plants in this way, they should, if their flowering quarters are occupied by other plants, be lined out in the nursery and, as in the case of Violas, have flaky leaf-soil placed about their roots. They will be best planted direct in their flowering quarters towards the end of the present month, but where the beds are occupied with spring-flowering subjects this is not always possible.

**Violas.**—Young plants that have been wintered in cold frames should now be planted out where they are intended to flower, but if the ground is still occupied by other plants,

they should be set for the present in the nursery garden. If a sprinkling of flaky leaf-soil is placed about their roots it will ensure them lifting with good balls when they are transferred to their flowering quarters.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Planting.**—The planting of deciduous subjects should now be completed as speedily as possible. Should the weather prove windy and dry, these latest-planted specimens should be given at least one good soaking with water. All the larger specimens should be staked securely so soon as planting is completed, as March is a windy month

growing plants in order to make room for choicer specimens, this work should be done at once. Remove the exhausted soil and refill the pockets with a compost suitable for the special plants to be re-set.

**Fruit Trees in Flower.**—As Peach and Nectarine trees are in bloom, also other fruit trees, such as Plums, Apricots and Pears, growing in cool houses where no fire-heat is used, attention must be given to pollinating the blossoms in order to secure good crops. Different methods are employed to secure this, but the surest and best is to go over the trees carefully with a soft brush made of a rabbit's tail tied to a light cane, passing the brush from flower to flower with a gentle twirling motion, about the middle of the day, preferably when the

FIG. 93.—CYMBIDIUM FLAMINGO MEMORIA SIR GEORGE HOLFORD.

R.H.S. First-Class Certificate and Lindley Medal, March 8. Flowers, bluish with red-brown markings. Shown by Messrs. H. G. Alexander, Ltd.

(see p. 184).

and much damage is done to newly planted trees and shrubs if they are allowed to sway backwards and forwards with the wind.

**Rock Gardens.**—The various subjects in the rock garden are on the move; indeed, many of the early plants are already making a good display. Some of the Saxafrages, such as *S. apiculata*, *S. oppositifolia* and *S. Salomonii*, have been in flower for some time; several of the early Primulas are also in bloom, and with the various Scillas, *Chionodoxas*, *Eranthis*, etc., the rock garden in March has many attractions. The rock garden should be made tidy, and a top-dressing of suitable compost given to all plants which require it, such as those showing roots on or near the surface. Where it is intended to remove some of the coarser-

sun is shining. To protect the eyes from the glare of the sun, shaded goggles should be worn, and a close observation of the state the pollen is in, whether it is yellow and easily dispersed, will assist the operator by showing which trees, and even which portions of the trees require attention first. By this means a heavy crop of fruits may be secured, and it will be an easy matter later to select the best-placed specimens for retaining, removing the others while they are quite small. On one occasion I placed a hive of bees in the fruit houses as an experiment, while the trees were in flower, and although quite satisfactory from the fruit-setting point of view, the great numbers of bees which perished in trying to find their way out of the houses, even though the ventilators were open, deterred me from doing so again.

## INDOOR PLANTS.

### ERANTHEMUM PULCHELLUM.

This plant makes a fine display during the early winter. If the plants are cut back now and stood in a warm house shoots suitable for use as cuttings will soon develop; the shoots should be detached when they are four inches to five inches long, inserted in an open compost, and placed in a propagating frame, where they will soon form roots.

The plants should be potted singly before the roots become entangled, and when well established they may be grown on in a light house. Pinch the young shoots once or twice to ensure a stocky growth. They will make useful flowering plants in six-inch or seven-inch pots next autumn. *T. P.*

### GLORIOSA.

If a portion of the stock of *Gloriosa superba*, the so-called Spider Lily, is potted at intervals, a succession of flowers will be obtained. The last batch of tubers potted in June will commence to bloom when those potted at the end of February are passing out of flower.

A moist, warm atmosphere is essential for the successful cultivation of this exotic plant. If the house is slightly shaded, the flower stems will grow longer than if exposed to full sunlight, which is an advantage if the blooms are used for table decoration.

Gloriosas require a rich, rough, open compost. Single tubers may be grown in seven-inch pots, or several may be placed in receptacles nine inches in diameter. When the plants cease flowering and the bine commences to change colour, they should be dried off gradually, storing them during the winter in a warm, dry place.

*G. Leopoldii* flowers several weeks in advance of *G. superba*, when started together. Its flowers are more open, the perianth segments wider and less undulate. This variety is similar in appearance, if not identical, with *G. Rothschildiana*, a fine species introduced from the Congo some two decades ago. *F.*

## ORCHID NOTES AND CLEANINGS.

### ONCIDIUMS.

The genus *Oncidium* is one of the most extensive in the Orchid family. The species are found wild over a vast area, and comprise plants that will succeed in the warm, intermediate and cool houses. They are, however, not cultivated so extensively as formerly, as they are not imported in such large quantities as in past years. Many of them are still regarded by cultivators as refractory subjects, and difficult to keep in a thriving condition over a series of years; this may be true of some, yet many have proved so successful under cultivation over a long period as to warrant their cultivation on an extended scale.

Specimen plants have great decorative value, whilst the light sprays of flowers have few equals for use as cut flowers. Whilst many of the *Oncidium*s are found growing wild with other Orchids which grow quite satisfactorily under cultivation, it is remarkable that many of the *Oncidium*s refuse to thrive. The flower-scapes of the greater number of them are out of all proportion to the size of the plants, and in many cases the latter are allowed to produce flowers before becoming thoroughly established. This should not be permitted, neither should the scapes be allowed to remain on the plants for too long a time.

Amongst the warm house *Oncidium*s the following may be depended upon to grow; and, with rational treatment, produce flowers year after year:—*O. ampliatum*, *O. Kramerianum*, *O. Papilio*, *P. Lanceanum*, *O. luridum*, *O. bicallosum*, *O. Cavendishianum*, *O. carthaginense*, *O. pulvinatum* and *O. splendidum*. Intermediate house kinds include: *O. altissimum*, *O. bifolium*, *O. divaricatum*, *O. flexuosum*, *O. hastatum*, *O. Harrisonianum*, *O. incurvum*, *O. incurvum album*, *O. maculatum*,

*O. phymatocylum*, *O. pubes*, *P. sphacelatum* and *O. Wentworthianum*.

*O. cheirophorum*, *O. concolor*, *O. excavatum*, *O. Forbesii*, *O. leucocylum*, *O. olivaceum*, *O. ornithorynchum* and its white variety, *O. Phalaenopsis*, *O. tigrinum*, *O. varicosum*, with the whole of the *Cyrtocylum* section, which includes *O. macranthum*, *O. lamelligerum*, *O. monachicum*, *O. serratum*, *O. superbiens* and *O. undulatum*, will succeed in a cool house. There are many others which may be grown for a considerable time, but I have purposely omitted those that are short-lived or difficult to cultivate.

Some few hybrids have been raised, whilst many which were regarded in the past as species are now known to be natural hybrids. *Oncidium*s have also been crossed with *Cochlidodas* and other Orchids, and are known as *Oncidioda*, *Charlesworthara*, *Wilsonara* and *Odontocidium*, which, combined with the species, make a most beautiful family of plants, the flowers of which may be enjoyed the whole year round.

The culture of the *Oncidium*s named is comparatively easy, provided the plants are grown in small receptacles, according to the habit of the individual plant, using pans in some cases, pots in others. A mixture of peat, fibre and *Sphagnum*-moss provides a suitable compost. The plants enjoy a humid atmosphere and a plentiful supply of water at the roots whilst in growth, with a drier atmosphere and only sufficient water at the roots to prevent shrivelling when at the resting stage. *J. T. B.*

## ALPINE GARDEN.

### GEUM RIVALE GUILDFORD VARIETY.

THE variety of *Geum rivale*, which bears the name of Guildford variety and sometimes Leonard's variety, is a very beautiful form of our native Water Avens, *G. rivale*, which has a graceful, pendent habit, but dull and unattractive flowers. The variety introduced by Mr. Leonard has blooms of a delightful shade of old rose, and they are produced freely. Being a form of the Water Avens, *G. rivale* Guildford variety needs plenty of moisture. In suitable positions it will grow eighteen inches high, but is dwarfier in dry soil. It begins to bloom early in summer and continues in flower over a long period. It soon increases in size, and may be propagated by division in the spring or autumn. *S. Arnott.*

### GENTIANAS.

I READ Mr. W. Ingwersen's interesting article on the Gentians (*Gard. Chron.*, February 26, 1927) with the same pleasure that it must have aroused in the minds of other would-be growers of these fascinating plants. As he refers to the white variety of *G. asclepiadea*, I may remark that fifteen years ago I got a plant from The Val di Genova, in the Presanella Alps, and it is flourishing in my garden. It is planted in old peat overlying a raised bed of burnt clay, and from its appearance it would seem this is just what it requires. Growing under the scanty shade of some *Azalea* bushes it leaves nothing to be desired in its vigour and floriferous habit.

Many Gentians, as Mr. Ingwersen hints, are "kittle cattle," and I found the common *G. acaulis* quite a disappointing plant, till, in despair of getting it to flower decently, I cast a number of clumps into stiff loam under a Holly hedge—the last place I would have expected it to tolerate. But there it has increased and flowers with the utmost freedom. The finest belt of *G. acaulis* I ever saw was in the garden of Mr. Clark near Glastonbury, where it formed a long border, some twelve or eighteen inches wide, of intense blue. I asked Mr. Clark "how he did it," and his disconcerting answer was that it was just put there and left reasonably alone. Truly the way of a Gentian, like that of some Lilies, is almost past finding out, and if it "does," it seems little credit, and if it "won't," but little discredit, to its lover.

I fancy that some of these plants may be

partial saprophytes. The brittle roots, with their often abundant mycorrhiza, at least suggest it. *J. B. F., Gerrards Cross.*

ALL alpine plant enthusiasts will have read Mr. Ingwersen's article (p. 143) on Gentians with interest. The writer, we all know, is a past-master in propagation and cultivation. I must admit to some disappointment at his omission of a few species which should certainly have been included in so comprehensive a list of the Gentians. Surely *Gentiana scabra* and *G. septemfida* should have been considered worthy of mention—the latter has a rare and beautiful Cambridge-blue form, as has also *G. asclepiadea*—as the needs of these two are easily satisfied, any well-drained, ordinary garden soil suiting them well. I rather suspect that *G. scabra* prefers a limestone moraine, however.

Two further invaluable and easy species are *G. lagodechiana* and *G. Freyniana*; these, I think, like a little peat at their roots, but are not adverse to lime; sun and good drainage in winter are essentials. One little gem which I obtained when Farrer's Plant Club came to an end is *G. Lawrenceana*. Although it is very difficult to please, I have had it several years: it is much like a minute *G. Farreri* in all its parts and when it condescends to flower, does so at the end of the season.

Of *Gentiana Purdomii* I can speak with some authority, having grown it to the fourth and fifth generation from the seeds which it lavishly produces and which germinate like *Cress*. It is essential to sow thinly, otherwise the seedlings, which come up at once if autumn sown, are liable to overcrowd each other and damp off in the winter season, even if kept in a frame. The adult plant likes sunshine and a good loam containing lime. I suspect that it would also appreciate some old manure buried deeply below its roots.

I once had a plant of what was said to be *G. Kurroo*, and I could not distinguish it from *G. Purdomii*, except that it was slightly larger in all its parts; neither of the two species seem to like the scree treatment with me.

The easier Gentians, such as *G. septemfida*, *G. lagodechiana*, etc., can be increased by chopping the stool into two or more pieces, like any ordinary herbaceous plant, but it is very true that the more exacting sorts do not like interference with their roots. I have found collected plants difficult to establish, even after having recuperated them in the sand box, and when they had produced a mass of roots.

I make it a practice of growing a batch of *G. verna* from seeds each year; the young plants flower in two or three years at the most, and such plants appear to be very accommodating. There are quite a number at the moment showing promise of flower; some are in moraine, others in peat, and still others in sandy loam, but their favourite mixture appears to be one of peat, leaf-mould and brick dust. *Maurice Amster.*

## FLOWER GARDEN.

### DOUBLE POTENTILLAS.

THE older double *Potentillas* are excellent garden plants, producing a good effect in the borders and giving a variety of colour. They may not appeal to many so forcibly as the newer Gibson's Scarlet and a few others of recent introduction, but they are capital border plants, perfectly hardy and require little attention beyond staking, tying, lifting and replanting occasionally.

They have fine, Strawberry-like foliage, and produce a succession of double and semi-double flowers from June until well into autumn. They grow from one to two feet high, and being somewhat trailing in habit they require to be supported by short stakes to produce the best effect. While they will grow in any kind of soil, a good, fertile loam, well-manured and deeply-dug gives the best results. They may be planted now for blooming this season.

Purchasers who receive small plants with a single crown may be warned that they cannot

judge of the value of these *Potentillas* for two or three years, until the clump has attained a good size.

Large clumps of some varieties present a grand sight. These double *Potentillas* are of hybrid origin, and quite a number of varieties have been selected and given varietal names.

The following is a list of choice varieties:—*Arc-en-Ciel* is a showy variety with a ground colour of yellow, flaked with crimson; it is still a favourite with growers of these flowers; a good variety which bears the unattractive name of *Beelzebub*, is one of the darkest, the flowers being a deep red; *Californica* or *Californie*, is a pretty canary-yellow variety; *Emile* has red flowers, edged with yellow; *Hamlet* is a dark crimson variety, and a favourite with many; it is very showy in a mass. The large-flowered *Mons Rouillard* has crimson maroon flowers prettily edged with yellow; *Mont d'Or* is an excellent sort with very fine double yellow blooms; *Panorama* is orange with purple stripes; *purpurea plena* is purplish-crimson, and, personally, I do not admire it so much as others; *rosaeflora* is dark red; *Vase d'Or* is a very fine, bright yellow variety; the late-flowered *Yellow Queen* is a capital sort with showy yellow blooms; *Vulcan* is deep crimson, and *Victor Lemoine* has bright red flowers, edged with yellow. Other varieties are in the market, but a choice from the above will give satisfaction to the grower.

Propagation is effected by division. *S. Arnott*.

## HARDY FLOWER BORDER.

### PLANTING HERBACEOUS BORDERS.

THE present is a suitable time for making new borders. Where the ground has been well-prepared during the winter, by manuring and double-digging, the surface soil may be again stirred with a fork, when it will be found to dry rapidly enough to proceed with the work of planting.

Many schemes are employed to make these borders a feature, and a considerable amount of knowledge of the plants utilised is necessary, such as their respective heights, time of flowering, as well as the colour of their flowers, to ensure a border which will be attractive for at least nine months in the year. Established borders also require attention at this time, and any of the coarser plants which have outstayed their welcome should be removed to the woodland or wild garden, and after making the sites previously occupied by them good again by the addition of fresh soil and well-decayed manure, their places may be filled by some of the newer or improved varieties. The ideal herbaceous border should not include annual plants, but be filled only with those of a perennial habit, of which there are thousands to choose from, while a few choice shrubs interspersed will give the borders a partially furnished appearance even in the depth of winter. *H.*

## RHODODENDRON MACKENZIANUM, FORREST.

SINCE the late Mr. Reginald Farrer described this interesting and remarkably distinct *Rhododendron*, on p. 302 of *The Gardeners' Chronicle* for June 21, 1919, enthusiasts in the culture of *Rhododendrons* have been closely watching the development of the seedlings. Accompanying the article is a figure of Farrer's No. 801, which has since been identified as *R. Mackenzianum*. It was the first *Rhododendron* found by the collector (on April 6, 1919) during his second expedition on the Burma-Chinese Alps. He describes it as a "tall tree with a gaunt, bare bole like a Scotch Fir, but of a brilliant lacquered-looking red, carrying a domed crown of solid soft pink blossoms. As the trunk, a foot through and fifty feet high, had no foot-hold, it became necessary to shoot down blossoms." Subse-

quently, *R. Mackenzianum* was found fairly general at 7,500 feet to 8,000 feet at Hpyepott and Hpimaw in North-East Burma.

A year previously, Mr. George Forrest—in April, 1918—was the first to collect *R. Mackenzianum* in the Shweli-Salween divide in Western Yunnan, at 10,000 feet (Forrest No. 16,111). He describes it as a shrub twelve feet to twenty feet high, growing in dense mixed forests and Pine forests. Curiously enough, *R. Mackenzianum*, Forrest No.'s 17,819 and 17,832, were collected in East Upper Burma at 9,000 feet to 10,000 feet during April, 1919, the same month and year as Farrer's 801.

surrounding the vegetative bud. This it will be noted, is just the reverse of the position occupied by the growing buds in most *Rhododendrons*, i.e., surrounding the flower truss. The stalks of the flowers are enclosed by a sheath of large, purple-tinted bracts. The five-lobed flowers are three inches to three-and-a-half inches across, white, flushed with mauve, with a large, yellowish-green blotch, and pleasingly fragrant. Outside, the lower part of the flower is flushed with rosy purple. There are ten stamens of unequal length and a style about two inches long.

Though the plant exhibited by Mr. Lionel de Rothschild, from his garden at Exbury,

FIG. 94.—RHODODENDRON MACKENZIANUM.

Shown at the R.H.S. Meeting of March 8, by Mr. Lionel de Rothschild.  
(see also pp. 185 and 195).

In a wild state, *R. Mackenzianum* is a straggling bush or tree, from about eight feet to forty feet in height, often with a distinct and attractive trunk. The leaves are borne in clusters of five to seven or eight at the ends of naked, annual growths. They are four inches to six inches long, one inch to one-and-a-half inch wide in the centre, gradually tapering to the ends, the upper surface bright, glossy green, the under surface paler, the whole leaf being distinctly glabrous and tinted with red on the outer edges.

The flowers are arranged in a fascicle of one or occasionally two-flowered inflorescences, five or six in number, at the ends of the shoots

at the R.H.S. Meeting, on Tuesday, March 8, and 9 (Fig. 94), was a straggly specimen, seven feet high, it proved much more interesting to *Rhododendron* enthusiasts than if three or four flowering sprays had been cut and placed in a vase. The plant had been grown in a greenhouse, and the species is not likely to be hardy in this country, though it may be possible to flower it against a sheltered wall in the south and west. Forrest's form, collected at 9,000 feet, to 10,000 feet, may prove to be hardier than Farrer's collected at 7,500 feet.

*R. Mackenzianum* belongs to the *Stramineum* series, which also includes *R. Wilsonae*, a closely allied species. *A. O.*

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be written on one side ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signatures will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron., Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and advertisements should be addressed to the PUBLISHER and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA\*

### VIII.—THE FIRST CLIMB.

**M**Y hut was ten feet square and about the same in height, built of unhewn logs and, therefore draughty; indeed, I had an excellent view of everything going on outside through three of the walls, the fourth being against a bank. To obtain more privacy and less wind, I hung canvas sheets against two of the walls. The roof consisted of a Bamboo framework tiled with the huge leaves, or rather, leaflets, of a Schefflera common in the forest. After the first month it frequently leaked, but the holes were easily stopped by inserting fresh leaves.

Mother earth composed the floor but, unfortunately, during the rains so much water oozed up from below that the hut was practically afloat; so I had a flooring of split Bamboo laid down, though even that was awash in the summer. A trestle ran alongside each wall, and on these I arranged all my boxes, out of the wet; a camp bed, table and chair completed the furnishing. In two respects I was particularly well off; the hut was as thoroughly well illuminated as it was ventilated, and that was a great score; secondly, in one corner I was able to keep a fire burning all the time, and my first care was to fix a couple of Bamboo racks immediately over the fire. On these racks my specimens, flower presses and clothes were for ever drying, and though, of course, everything was smoked to a uniform mahogany, it was the only way to keep specimens from utter ruin in the warm, saturated atmosphere, or even to enjoy the luxury of dry clothes. I came back wet through every day, but having warm and dry clothes ready to change into, suffered no ill effects other than the discomfort of smoke-varnished garments; and to that I quickly grew accustomed.

My men lived alongside in an ample shed, open to the river in front, with a high, steep roof which came right down to the ground behind.

\* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, March 5, 1927.

Throughout the months I lived here, or in my several camps higher up the valley, the daily programme was much the same. I rose at, or before, daylight, and had a cup of tea and two chappatties. Then, while the staff were breakfasting, I worked on my plants and field notes, or whatever work there was left over from the previous day. About nine, I breakfasted, and at ten started out on the day's exploration, getting back about three. Then I changed, had tea, and settled down to a couple of hours' work on the collection. At seven, I dined in solitary state, and passed the evening writing my diary and reading; it was rarely that by ten o'clock I was not quite ready for bed.

The first day after arriving at the base (Fig. 97) I turned my attention to the mountains which hemmed us in on every side. Around the Tibetan settlement was a strip of permanent meadow, just above the river, and above that again were steep, cultivated slopes. But this tiny clearance was but a reef in the vast and

FIG. 95.—A NUNG GIRL OF THE LOWER  
SEINGHKU.

towering ocean of forest which surged over the pathless mountains. A single track led up the valley to the alpine pastures below the Diphuk La; but my immediate concern was to scale the mountainous ridges which frowned down on my camp. After several unsuccessful attempts, I did succeed with one of my men in blazing a trail up through the temperate rain forest to a razor-backed ridge, 3,000 feet above the torrent, and in the course of this ascent, I was able to form a good idea of the forest flora.

The face by which we ascended was very steep, sloping to begin with at an average angle of about 50°, but towards the crest the slope increased to about 65°. Down below, the forest was extraordinarily open, almost the only undergrowth being a formidable species of Bamboo, armed with a cheval-de-frise of frightful spikes at each node. Coming swiftly down the hill one would grab hold of a Bamboo haulm to stay oneself, and rip one's hand open on these dreadful claws.

The trees were, mostly, a species of Gordonia or Schima, Rhododendron Mackenzianum (Fig. 94), species of Oak, Myrtus and certain Araliaceae. A little higher up at about 7,000-8,000 feet, one

came into forests of immense-leaved trees, the two most notable being a 'Grande' Rhododendron, which was almost certainly *R. giganteum*, and a huge *Magnolia*, *M. rostrata*. Neither was in flower—April is probably their flowering period, or even earlier, so I was at least a month late. *R. giganteum* is a splendid tree, outwardly not unlike *R. sino-grande*, but bigger. It was abundant on both sides of the valley at 8,000 feet, growing in very open forests with *Magnolias*, *Illicium*, *Oaks*, *Birch* and *Schima*, young plants—of which I saw plenty coming up in the open forest where there is very little undergrowth—have immense leaves, which do not take on the characteristic silver lining until they are many years old, and over twelve or fifteen feet high. The trusses are of immense size, and I picked up capsules four inches long. The tree grows sixty feet to eighty feet high, with wide, spreading branches, and is overtopped only by the magnificent *Magnolia rostrata*, which reaches fully ninety feet, and being deciduous, displays its fine limbs in winter. It was very common hereabouts, scattered through the middle zone of the temperate rain forest, and in full bloom must be gorgeous. Its distribution is of botanical interest and significant. This is the species I found in the Tsangpo gorge three years ago—its furthest record to the west. It is recorded from the Mekong-Salween divide, in about the same latitude, to the east, and from as far south as Hpimaw. In Sikkim it is replaced by *M. Campbellii*. Amongst these big-leaved trees there flourished also a noble *Illicium*, the trunk of which, towards the base, was curiously wrinkled with transverse parallel puckers. The flowers were small for so big a tree, cream-coloured and fragrant.

A little higher up there was a belt of dwarf Bamboo through which we had to hack our way, and above that the real trouble began, for we found ourselves at the foot of a very steep, broken slope, with immense blocks of stone piled anyhow on each other, and the whole earth-shaking slip overwhelmed beneath so tight a tanglewood that it was impossible to move an inch without first hewing a way through. Here, in desperate strife, shouldering and pushing each other, growing on top of each other, sometimes three deep, panting for air and light, grew an amazing variety of shrubs, epiphytes and stunted trees; and every crevice left over below was tightly packed with dwarf Bamboo, and over all lay a shroud of moss, which hung in weeping festoons from the branches, and covered the rocks as with a green sponge.

Here bloomed a beautiful 'Grande' Rhododendron with ball-like clusters of bright, wintry-sunshine yellow flowers, and a large-leaved 'Barbatum,' something like *R. strigillosum*, with massive trusses of rose-purple flowers, having a rather pungent, darker flush at the base; but the foliage is handsome and pachydermatous-looking. Here, too, was *R. Maddeni* not in flower, and spouting out of the cliff crevices, *R. megacalyx*, just coming into flower. This last is one of the most bewitching of all the 'Maddeni' Rhododendrons, alike in flower and leaf; its firm, milk-white trumpets, with the Daffodil-yellow of summer twilight reflected in its throat, and the delicious dewy fragrance breathed out of its mouth, place it amongst the elect.

Finest of the Rhododendrons here, however, for sheer colour effect, was a small, straggling bush, ragged-leaved, untidy, but breaking out all over in such an eruption of fierce, butter-golden flowers as astonished me. It was one of the 'Campylogynums'; was it indeed *R. aureum*? Yet I do not think *R. aureum* has this dazzling effect of hammered gold, seen in K.W. 6751.

Amongst these bushes grew a species of *Laurus*, smothered under a mist of creamy-white, fluffy flowers; a ruddy-leaved Maple, something like the Japanese *A. palmatum*, or *A. japonicum*, *Michelia* sp., *Ilex*, *Enkianthus*, and other tanglesome plants. The *Ilex* mentioned was particularly handsome, and not at all Holly-like in appearance. It is a small tree, twenty to thirty feet high, irregularly branched almost from the ground, the branches

MUNICIPAL BOULEVARD GARDEN, COPENHAGEN.

all lying outspread in one plane, with all the interstices filled with the tiny, round, finely-toothed green leaves, also borne in one plane.

The result is to give a tabular or stratified effect, broken up and overlapping, which is

and made good progress astride the ridge, half-way to the summit. It was on this occasion that we found the beautiful 'Silver Barberry,' mis-called Holly, a meritorious *Cotoneaster*, two pretty bush *Rhododendrons* and various *Ericaceae*. Of these I shall tell later.

FIG. 96.—EPIPHYTIC FLORA AT 4,000-5,000 FEET; RHODODENDRON DENDRICOLA, WITH RHAPHIDOPHORA, FERNS AND ORCHIDS.

very effective. The leaves are even smaller than, and not so leathery and dull as those of *I. crenata*, and, of course, the habit is quite different. The leaves recall those of some species of *Nothofagus*, hence the provisional name, *I. nothofagacifolia* I have bestowed on this plant. The berries are tiny, but as scarlet as those of our own plant, and when borne in numbers, the effect of these red beads, strewn along the layers of olive-green leaves, is delightful. *Ilex nothofagacifolia*, then, is a shade-loving, forest tree, requiring plenty of moisture and a rich soil, but indifferent to snow, and wretched, damp cold, such as one gets in the Seinghku valley at 8,000 feet in the winter and early spring; for the snow does not lie here much. But it is not happy. I found dozens of trees, but only three bore flowers, and the seed supply was severely checked. Probably these forests are too dismal for it: the conditions are too wet and dark. The trees were all draped and frilled with moss, hanging from the boughs like seaweed, and this insidious creeping death seemed to clutch at their hearts and paralyse them. It would be happier in more healthy surroundings.

The *Enkianthus* struck me as another interesting plant with possibilities of garden value. It grows hardly so tall as *E. campanulatus*, and bears far fewer flowers; but these are of a bright, cherry-red, almost globular, with a small, pursed-up mouth. They hang well clear of the foliage on long, stiffly-arched pedicels, all up the slim stems, and in autumn the blood-red leaves shine out sharply from the evergreen thickets.

On our first climb we failed to reach the crest of the ridge, being badly held up by the tanglewood, through which it took us a long time to hack our way; and having cleared a narrow track we found the face almost precipitous, much scarped and broken, and difficult enough to ascend without the added embarrassment of the tanglewood. On the other hand, without roots and branches by which to haul ourselves up, we might never have scaled the cliffs at all. On our second attempt, however, we finished the path to the razor-backed ridge,

Meanwhile the epiphytic flora (Fig. 96) of the tanglewood deserves a word. It included a *Rhododendron* of the 'Vaccinioides' type with wee

FIG. 97.—VIEW DOWN THE SEINGHKU VALLEY FROM CAPT. KINGDON WARD'S BASE CAMP AT 6,000 FEET.

Forest clearing on left; cultivation in the right foreground.

leaves, an 'Edgeworthii' with bright-yellow flowers, partial to old Juniper trees, species of *Agapetes*, and so on; with a profuse tangle of *Clematis*, *Vitis* and other climbers. *F. Kingdon Ward*.

## TREES AND SHRUBS.

### ERIOBOTRYA JAPONICA.

THIS conspicuous evergreen shrub from Japan makes an ideal plant for covering walls, or as a bush plant in the open in the milder parts of the country. The leaves, which on good specimens often measure eighteen inches or more in length, are of a beautiful dark green on the surface and downy underneath.

On the long wall bordering the lawns and flower garden at Pyrford Court, the seat of Viscount Elveden, are two fine plants of this *Eriobotrya* amongst other interesting shrubs. The effect of these plants, with their large, evergreen leaves, during winter, when the other shrubs are bare, is charming and they are equally effective during summer when making their vigorous, young growth.

From the appearance and the splendid yearly growth these plants make, the position chosen for them suits them admirably. *Eriobotrya japonica* will grow as a bush in the south-eastern area of London, but the plant does not exhibit such clean, vigorous growth as it does under more favourable atmospheric conditions. *F. W. G.*

### VIBURNUM FRAGRANS.

THIS is a delightful, early-flowering shrub, originally introduced from China by Purdom, and again by Farrer, who, I believe, is responsible for the plants now growing in this country. It would be interesting to know if this shrub has proved hardy in most parts of this country, because it is such a fine plant and one that should be planted freely.

Here, at Chepstow, there is a specimen some five or six feet in height, and in February it is unequalled for its exquisite flowers, which are delightfully fragrant.

So far, our specimen has not been injured by cold, although we have at times experienced upwards of 18° of frost. In many respects it resembles the well-known *V. Carlesii*, but with me, *V. fragrans* is much more upright in growth, and not so spreading as *V. Carlesii*. It should

prove a useful subject for the cool greenhouse, where its beautiful trusses of white flowers would be protected from blemish by wet weather. This *Viburnum* is a decided acquisition. *T. W. B.*

## LEAF ROT OF THE CARNATION.

## A NEW AND DANGEROUS DISEASE.

DURING January we received, through the medium of *The Gardeners' Chronicle*, examples of diseased Carnations grown in the open near Brighton, Sussex, which were suffering from a disease caused by a fungus which was new to us. In the course of correspondence, Dr. G. H. Pethybridge referred us to an account of the disease given in 1921 in the German periodical *Die Gartenwelt*.<sup>\*</sup> In this account the authors Dr. G. Höstermann and Dr. R. Laubert, give an excellent description both of the disease and of the fungus concerned. Since the German periodical is absent from the libraries of this country (at any rate as regards London), it will be well to give here a translation of that

areas, transparent, and like a spot of grease lying in the leaf, nearly  $\frac{1}{4}$ -mm. in diameter, with a more or less distinct point in the middle. This point is frequently covered by a tiny, waxy, whitish or yellowish grey, wart-shaped or conical, granule. When the diseased leaves are placed in a "moist chamber," this granule looked at with a lens, is often seen to resemble a longer or shorter tendril-like string of little sausages.

Affected plants have an unhealthy and diseased appearance. A microscopical examination shows that the parenchyma of the diseased places in the leaf is collapsed and permeated by colourless septate hyphae which form in the outer parts of the epidermal cells a thin layer of plectenchyma under the cuticle. From this layer there develops in places a colourless, disc-shaped pustule of conidia of very variable size and up to 0.3mm. in diameter. These

variable. The median cell of the spore is usually 6-7 $\mu$  long. The spores are capable of germination at once. Inoculation experiments were carried out with spores sown on healthy Carnation plants, and these became infected with the disease.

The fungus is considered as forming a genus new to science, and is named *Pseudodiscosia Dianthi*. The disease is certainly equal in economic importance to those caused by the attacks of the well-known pests of the Carnation, Rust (*Uromyces caryophyllinus*), 'Fairy Ring' (*Heterosporium echinulatum*), etc. It has occurred in various nurseries at Leipzig and elsewhere, and caused serious damage, both on plants in the open and in the house. It is to be concluded that special conditions are required to enable the disease to thrive and establish itself. A considerable degree of atmospheric humidity and dull weather may be regarded as favouring its development. The susceptibility of different varieties is clearly different. Thus, in one case, in 1920, only a certain new variety (the name of which is not disclosed, in the interests of the raiser), was affected, while other varieties growing contiguous remained healthy. In another case it was the variety Agadir which was the first to be attacked specially, although later other varieties suffered, but not to the same extent. The variety Souvenir de Cannes proved the most resistant.

The authors state further that sufficient experience has not yet been obtained with regard to the control of the disease. The grower will do well, however, to take the correct cultural measures (provision of sufficient light and air, avoidance of stagnant or too high air and soil-moisture, unsuitable soil and manuring, strict cleanliness, etc.), to strengthen and harden the plants so as to prevent them, as far as possible, from becoming diseased. Where the disease has occurred, all the affected parts of the plant should be cut off and destroyed, and a fungicide (either a spray or dust) should be repeatedly employed on an experimental scale, and perhaps also, in case of necessity, the isolation or destruction of the specially susceptible varieties. According to a communication, the use of sulphur and Bordeaux mixture (1-2 per cent.) was attended with no success. One grower is said to have had a certain measure of success against the infection by spraying with a strong solution of salt.

The following is a description of the disease and the fungus causing it, based on examination of the affected plants from near Brighton. It will be seen that in all essential features the disease symptoms and the characters of the fungus are the same as those described from Germany.

Specimens of the diseased Carnations were received in January of this year from the grower, and a visit was paid to the premises in order to investigate the extent of the damage. Only one kind of Carnation was attacked. This was originally derived from a seedling<sup>\*</sup> raised by crossing the variety Mrs. Brazier with the best border varieties. The first cuttings of the original seedling plant were struck in 1914, and the raiser reported that there were no signs of disease till 1922, in which year three or four Old Clove Carnations had been introduced close to the main stock of the variety now diseased. It was noticed that these plants, at the time of introduction, were attacked by a leaf disease. On this account the Clove Carnations were removed after a fortnight and were burnt. The grower stated that a leaf disease then started on the variety now attacked, but since no critical examination of either plant was made at the time, it is not now possible to determine whether the old Clove Carnations can be held responsible. In 1925, nearly the whole stock of 400 to 500 plants (planted in rows at two feet spacing) was destroyed by the grower, after a small supply of cuttings had been taken, owing to the unsightly appearance of the foliage and to the considerable reduction in size and number of blooms.

The affected plants which we were able to examine had been started as cuttings in August, 1925, and, after the following winter, had been planted out. In May, 1926, according to the usual method, the main stem had been cut back

part of the article which deals with the disease symptoms and other points of practical interest.

The authors entitle their article "A virulent new fungus disease of the Carnation," and state that the leaves of the diseased plants show on both surfaces large discoloured patches which are brown, soft, or when dry, bright whitish-grey, and occur either as transverse bands or extend over the whole terminal part of the leaf. The leaf at the affected places becomes, as the result of the weakening of the tissues, withered and often cracked. Similar discoloured spots occur frequently on the stems, flower stalks, bracts and sepals. Very small, round, rather dark grey, spots are present in large numbers on both sides of the diseased part of the leaf. These spots are for the most part so indistinct that they are hardly recognisable. They become a little more evident if the leaf is held up against the light. They appear then as rather closely grouped circular

pustules of spores burst the cuticle and raise it up so that the split cuticle completely surrounds each pustule of conidia like a collar. From those cells of the pustule which function as conidiophores, the characteristically shaped conidia are abstracted. The conidia are rather variable in shape, oblong, mostly spindle-shaped or obclavate, broadest in the middle or towards the lower end, slightly curved like a sickle or almost straight, thin walled, colourless, contents transparent or more or less vacuolate—granular, mostly 2- to 3-septate, occasionally somewhat constricted at the septum. Typically, the spore gradually tapers at the upper, narrower, end into a long, awl-shaped or thread-like tail, while the opposite, lower, broader end is provided with a shorter, thread-like, appendage which usually is situated not exactly at the end, but is pushed a little towards the concave side of the spore, and in consequence is directed somewhat obliquely sideways. The spores are 3-7 $\mu$  broad and 12-42 $\mu$  long; without the appendage and tail, 12-24 $\mu$ . These are not uncommonly absent, as the spore are very

FIG. 98.—LEAF-ROT DISEASE OF CARNATION.

One of four slightly diseased laterals pulled from a plant on February 6, 1927. The latter was raised from a cutting taken in August, 1925. The terminal rosette of leaves is attacked and grey in colour. The bases of leaves on a secondary growth (to the right) are also affected. Half natural size.

## LEAF MOULD WELL ROTTED

1,000 yards to clear

Samples and Quotations from **E. J. WOODMAN & SONS**  
**HIGH STREET—PINNER—MIDDLESEX**

and from four to eight strong laterals had grown out as a result of this treatment. The plants were now (February, 1927) about eight inches high, and measured about eighteen inches across. It was noticed that the few plants present of three other varieties were not affected.\*

Diseased plants are characterised by rotting of the leaves, though the rot does not necessarily affect every leaf on a shoot, and here and there a healthy green leaf may be found amongst those diseased. The rot, which is of a dry or wet nature, according to the state of the weather, most commonly occurs at the bases of leaves where, owing to the weight of the major healthy portion, transverse cracks are caused and lead to drooping and shrivelling of the leaves. If a plant, when dug up, is roughly handled or shaken, a slight fall of leaves takes place. Such leaves are still green but are brown and rotted at the base. Much of the foliage of the growing plants was thus withered; they appeared rusty brown with occasional green leaves projecting from the curling, withered, foliage.

The dishevelled appearance of the normally erect foliage is accentuated by the state of the youngest leaves at the tips of the shoots. These, even while still clasped together and, if dry, are seen to be of an almost pure white colour for a considerable part of their length. When wet, the colour changes to dull grey-brown. As a result of the disease, they may be unable to open (Fig. 98), and if, as sometimes happens, rotting occurs more on one side than on the other at the base of the closed terminal spike, or if uneven growth takes place, on one side only, within the still closed spike, the latter may fall over or become looped and distorted, the young leaves within being still clasped together and unexpanded. The attack on the terminal cluster of youngest leaves may be limited to one or only a few shoots, or it may involve every terminal cluster on the plant and every young lateral arising from the main stems. The difficulty in obtaining healthy young shoots for cuttings at once becomes apparent if the process of infection continues thus into the summer months. The grower informs us that the worst effects of the disease are seen at the end of summer, continuing during autumn and through the winter, after which the new growth becomes infected.

In no case were we able to find that the stems were attacked. Whole shoots when cut longitudinally with a knife, showed that the disease had proceeded no further than the extreme ends of the leaves at the place of their attachment to the stem.

The above account describes the state of the plants as they would appear to the general observer. Closer examination showed that the bases of leaves only recently attacked were marked by grey-brown patches extending all across the lamina and usually fringed at the upper edge with white (Fig. 99). A zone of purple colour lay between the white and the healthy green part of the leaf blade. Such patches might extend from one to four centimetres ( $\frac{1}{4}$  inch) up the lamina. Occasionally an isolated patch of similar colour was found to occur about half way up the leaf blade, and in this case it might extend across (Fig. 99) or only part way. If it completely traversed the leaf blade, the white and purple zones occurred both above and below the diseased area. The following measurements give some idea of the size of the isolated diseased areas in relation to the leaf. On leaves which measured 1.0cm. in breadth and 12.0cms. in length, there were isolated patches extending up to 2.5cms. in length, with white and purple margins measuring an additional 5.0mm. at either end of the brown patch. The diseased areas are visible on both surfaces of the leaf, and are rather more clearly defined on the lower (ventral) surface. The brown patches are light-coloured when dry, but in wet weather readily become water-soaked and soft, and when in this condition, the epidermis easily parts from the underlying tissue. *E. S. Salmon and W. M. Ware, South-Eastern Agricultural College, Wye, Kent.*

(To be concluded).

\* One of these was a seven-years-old hybrid of the same female parentage as the susceptible variety.

## LATE PLANTING.

ALTHOUGH the winter has, on the whole, been favourable to the planting of fruit trees, ornamental trees and shrubs, much still remains to be done, as the difficulties of doing this work at the proper time are many and there are sure to be some arrears. It is generally agreed that the best planting season is from the middle of October to the end of November, and on some soils planting may be continued with success until the end of March, but for most soils late October and November planting is by far the best.

Amateurs especially should avoid planting on wet and pasty ground during December and January, but in free-working soils even these months may be chosen, provided there is no stagnant water near the surface and the weather is favourable.

The preparation of the soil is as important as the time of planting, and the planter should

should be laid out accordingly, so as to run little or no risk of them exhausting the supplies of food and moisture in a dry season. It is not advisable to mix manure in the soil when planting hard-wooded subjects, except for some shrubs and trees when the soil is very poor. A thin surface mulch applied at planting time in late spring is far more beneficial to the trees. Particular attention should be paid to staking freshly transplanted, large trees to prevent them being swayed to and fro by strong winds, as the roots often suffer serious damage from this cause alone.

Late spring planting has some advantages and is the best time for many evergreens. Hollies, for example, should be transplanted just before growth commences, when large trees may be moved with safety. It need hardly be said that a certain amount of care is needed to remove large trees; if they can be prepared one year in advance by cutting back the strongest roots so much the better, and as large a ball of soil and roots as possible should be taken up and replanted without loss of time. Other conditions essential to the success of late spring planting are to keep the plants for as short a time as possible out of the ground, so that the roots may not become dry; to give the roots abundant supplies of water, and to apply a mulch to prevent undue evaporation of soil moisture. Syringing the trees in the evenings of dry days until they become established is also an advantage. It has been frequently shown that trees and shrubs may be transplanted successfully at almost any season of the year.

Apples and other fruit trees may be planted up to May, but they will do best if planted in the next few weeks. No difficulties need be experienced in the late planting of smaller trees and shrubs that have been regularly transplanted. Since the introduction of so many new Rhododendrons and other half-hardy choice trees and shrubs, late spring planting has been carried out with the greatest success. The depth at which to plant should be governed by the ground mark on the stem; to plant higher injuriously checks growth, and to plant lower invites disease. When the roots are brought nearer to the surface it is of the utmost importance that they should be protected by a covering of stable litter or similar material to counteract the evil effects of a dry period in spring and early summer. *F. Jordan.*

## DISEASES OF LILIES.

(Concluded from p. 179).

EXPERIENCE has shown that the first of Massee's suggestions has little practical value, for Botrytis is primarily a disease of leaf and stem; if neglected it will ultimately reach the bulb through the stem, but not, ordinarily, through the ground, for the mycelium does not lie deeply near the bulb, but in the surface soil. Careful cultivators naturally surround Lily bulbs with sand, but, for the reason given, that is no safeguard against Botrytis. In theory, Massee's further suggestion that the top soil should be skimmed off every autumn after Lilies have flowered and fruited is sound, but in practice it is hardly feasible where Lilies are grown on more than a most modest scale. Where they are interplanted—as they should be—with other subjects, it is not possible to remove all the surface soil; much of it must remain, to harbour mycelium. The ideal medium would be some liquid, with which every particle of suspected ground can be saturated, and which, while destroying the mycelium shall not injure plants or bulbs. The situation as presented to cultivators is analogous to that confronting medical science in its search for a bactericide which shall render bacteria in the human body innocuous without damaging the tissues whereon or wherein they shelter.

As a remedy for Botrytis, Massee proposed spraying the foliage of infected plants with a solution prepared by dissolving two ounces of potassium sulphide in three gallons of water, and that, or spraying with Bordeaux mixture, remains the gardener's stand-by. If the disease has not gone very far the remedy is usually

FIG. 99.—LEAF-ROT DISEASE OF CARNATION.

(Left) diseased area at base of the leaf, lower (ventral) surface. (Centre) An isolated area half way up the leaf, lower surface. (Right). At base, upper (dorsal) surface. Three-quarters natural size, February 6, 1927.

first see that the ground is well-drained; where the land approaches to pure clay it is best to remove it and substitute richer, finer soil. Almost any kind of soil resting on a dry sub-soil may be made suitable for fruit trees and shrubs by a liberal addition of loam, leaf-mould, sand, road scrapings and garden refuse.

Other important points in planting are to make the hole large enough to break up the soil at the base of the hole and, if the roots are of a spreading nature, to shorten them as much as is necessary with a sharp knife from below. All injured roots should be cut off to a sound part, and those growing directly downwards shortened to six or eight inches. It is equally important on heavy, wet soils to plant well above the ground level, especially in the case of fruit trees. Never plant too deeply, rather err at the other extreme, but it is also possible to have the roots too near the surface for the welfare of the trees. The nature of the roots, whether fibrous or not, much more than their place in the ground, determines their measure of useful work, and they

efficacious, but there are times, and they have been too numerous in the south of late years, when *Botrytis* is beyond human control; when it comes in an irresistible wave carrying all before it, and constitution and cultivation count for nought. It may come, too, like a thief in the night, as when the writer himself saw a field of *L. umbellatum* in remarkably healthy condition, irretrievably ruined in a single night of chill Atlantic fog in June, almost every leaf on every plant of hundreds hanging limp on its stem next morning.

*Botrytis cinerea* will only flourish in dull, damp weather, and for reasons which Ward made clear. To understand its method of attack, we may assume, as, indeed, we are entitled to nowadays, that the mycelium is almost universally present in the crust of the ground in gardens, having germinated there from spores which fall from the diseased foliage of many plant genera. As a saprophyte as well as a parasite the mycelium is found on heaps of decaying vegetable matter, leaf-mould and the like. In winter the mycelium is dormant, but in spring and onwards till the winter again, it is active, and produces a crop of spores. A puff of wind, a stirring of the ground by a bird, or by spade, fork or trowel, and the spores, invisible to the naked eye, are floating in the air; they alight, possibly in clouds, on the leaves of a Lily, and if the leaves are dry are innocuous. If, however, they are wet, the spores, to fulfil their function of fastening parasitically on a leaf, excrete a ferment which softens the walls of the cells in the skin of the leaf and enables the microscopic thread-like filaments, or hyphae, as mycologists call them, to feed on the substance of the cells. "This ferment . . . requires water if for no other purpose than to enable it to diffuse, but also because the more watery the cellulose the more easily is it dissolved." Having pierced the softened cuticle, the fungus begins its deadly work of invading the tissues of the leaf; at first it is a mere freckle, but after a week of weather favourable to the fungus the affected area may have enlarged to the size of a sixpence, orange in colour and with a black speck in the centre; gradually patches of grey mould spread outwards from these orange-coloured markings, and in a fortnight or less from the moment of infection the whole leaf or bud may be a rotting mass. If one or two leaves or flower buds only are attacked, they may be removed and no further harm will be done, but that happy state of things is rare. Usually many leaves are stricken and in an epidemic every leaf will be covered with the parasitic fungus. Whether the original attack is mild or serious, if the appropriate remedy is neglected, the end is the same, provided the weather conditions are favourable to the fungus; the whole plant becomes involved and eventually the stem collapses. The fungus is now on the way down the stem to the bulb, which it ultimately reaches, and then, like the rest of the plant, the bulb is reduced to a sorry mass of slimy, rotting scales. All the time the neighbouring ground and plants are being fouled by clouds of spores from the stricken stems and leaves, and these spores in turn will pursue their deadly functions.

If, however, before the plant is irretrievably involved, wet or damp weather gives place to a hot, sunny spell, the progress of the fungus will be arrested, the orange-coloured markings become dry, leathery patches, and though the plant may be crippled, that may escape all but the expert eye. The year 1925 furnished a typical example of the power of sunshine over *Botrytis*. In the south the weather of the first half of the year was consistently chilly and dull, almost up to midsummer, and *Botrytis* was rampant. Then followed a month of roasting sun, and the effect on the fungus was miraculous, for the progress of the disease was completely stayed, as if by magic. Plants which had been attacked and were not too far gone, recovered in remarkable fashion, and though scarred, threw off all active signs of the disease and flowered well. According to Marshall Ward, intense sunshine and high temperature mean "rapid transpiration and energetic assimilation processes by which hard, thick cellulose walls

are produced. The cuticle is also well developed, thick, clean and continuous under such conditions; and growth is steady, there being no superabundance of water, the light being bright." Happily, in the sun, Nature herself provides what at present seems the only preventive and remedy for epidemic *Botrytis*, and as cultivators of the genus know, in a sunny season the fungus gives little, if any, trouble. The explanation advanced for this is that the spores cannot exercise their excretory function in the absence of moisture on the leaf; but experiments made by the writer in the hot summer of 1921 seem to show that even if the foliage of Lilies is kept permanently moist in a cloud of vapour during sunny weather, it is still not affected by the fungus. It seems possible that the rays of the sun itself may have a sterilising effect on the fungus; on the other hand, the temperature factor may have some bearing on the impotence of *Botrytis* in hot weather.

Some mycologists hold the view that before a plant will succumb to *Botrytis* there must be some lowering of its vitality, either by adverse weather conditions, indifferent cultivation or some other factor; others hold that vigorous plants are not attacked. They have only to experience a serious epidemic of the disease, however, to realise that it makes no distinction in its choice of victims; as Marshall Ward and other investigators observed, weak plants and strong alike are attacked, and in an epidemic the writer has noticed that the Lily with possibly the strongest constitution of all—*L. Henryi*—is as often a victim as not. Even *L. giganteum* does not always escape.

Just as Ward had completed his exploration of the disease, Kean, who at that time was attached to the Massachusetts Institute of Technology, went to Bermuda to investigate a disease which was devastating the plantations of *L. longiflorum* in the island, and had not then been identified. It had been first noticed about three years before (1885), and in what we now know to be characteristic fashion, had spread like wildfire till all the plantations were in its grip.

Kean found that the disease began to show itself in the spring of each year, when the days began to grow warm while the nights remained comparatively cool. "The marked difference in the temperature between day and night results in a heavy fall of dew, so that even after the sun is high in the heavens large, cool drops of dew may be found on the leaves of Lilies. A little cool weather, or a few warm, dry nights free from dew will check the activity of the disease, while a warm, damp day will cause it to spread with great rapidity." Kean noticed that plants under the hedges of Oleander by which the fields are surrounded, did not contract the disease to a noticeable degree, and he reasoned that this was because the high, over-hanging hedges collected most of the dew, so that the leaves of neighbouring Lilies were comparatively dry. In the course of his investigations of the disease, Kean showed that it had no bacterial origin, but was due to a fungus, a conclusion previously reached by Ward, who identified specimens sent to him from Bermuda by Kean as identical with the *Botrytis*, the life history of which he had recently explored. *A. Grove.*

## APIARY NOTES.

WITH the advent of real spring weather, and the intense breeding within the hives, the bee-keeper begins to think of the harvest. It is well he should, for, if success is to be achieved, he must make his preparations well ahead. The nature of the crop he is to work for will materially affect his management henceforward.

One matter, however, is of universal application—the clipping or otherwise of the queen. This is a practice almost universal in large apiaries, if not in this country, at least in America, and in the case of those with out-apiaries to manage, it is almost imperative. The operation consists in gently lifting the queen from the comb and, with a pair of sharp scissors,

cutting away part of her wings. It is analogous to cutting the flight feathers of a fowl, and is in no way harmful to the queen, nor is it in the slightest degree painful. To perform the operation some deftness and delicacy are required, but with a very little practice it becomes easy. A nervous bee-keeper may practice on a few drones. Take the insect off the combs by seizing her wings between the thumb and first finger of the right hand, and then transfer her to the left hand finger and thumb, but this time gripping her firmly, yet gently, by the sides of the thorax, i.e., the part of the body from which the wings spring. Do not, on any account, grip her by the abdomen. Then, the wings being uppermost, snip off about half or two-thirds of both wings, and carefully set her down on the comb again. Do not drop her! Remember that her abdomen is full of delicate eggs, and the least pressure, or fall, may ruin her fertility. Be most careful, also, not to cut her long, strong legs—a thing easy to do, for they always seem to be in the way during the operation. The merit of clipping is simply this: that, when a swarm issues, the queen, attempting to fly, is unable to do so. The result is, that after clustering for a while, the bees find the queen is not with them, and come pouring back to the hive. The sight is ludicrous! They seem to me conscious April fools as they come tumbling back into the hive. If the owner is there when the swarming occurs, all he has to do is to pick the queen up from the ground and take steps to prevent further swarming; and if he is not there, whilst the queen is lost, the swarm is not. By clipping, and examination of the combs for queen cells every eight or nine days during the swarming season, it is possible for a bee-keeper who is away from home all day, to avoid the loss of a single bee through the swarming season. Those always about their hives will not find the practice so valuable, but even they may be saved many awkward climbs after swarms if they clip, and then, after catching the queen on the grass, artificially swarm the stock. The whole secret lies in the fact that no swarm ever goes away without a queen. Swarming much depends, however, on the character of the crop desired. If extracted honey is sought for, then swarming may never occur. Plenty of room to store and space for the bees to cluster will do a lot to obviate it. But, if sections are to be the crop, swarming is hard to avoid. I always think of our section stocks (and we work about three hundred each season for sections alone) as so many guns at full cock. The slightest error, and off goes the gun, and good-bye to crop and all. There is no question that obtaining sections is skilled work. Remember that a crowded hive is essential, and a crowded hive is the very essence of swarming. So the difficulty is to load the gun to the barrel mouth, and yet prevent it exploding. But, if sections are wanted, that gun must be rammed down, and double-rammed. Yet the fact that we sold over five thousand sections last year proves that it can be done—and only a few of our guns exploded!

Having decided on sections, another point of importance is, which kind of sections, for there are, broadly, two kinds—Bee-way and No Bee-way. The former requires tin separators, the latter fence separators. After a wide experience of both, I do not consider there is any comparison in efficiency. Fence separators and No Bee-way sections are infinitely the better. Whether the size be  $5 \times 4$  or  $4\frac{1}{2} \times 4\frac{1}{2}$ , the fence separator gives amazingly the better product. The bees enter the sections with less reluctance, they work more efficiently, and they finish the sections right down to the bottom. Tin separators are cold and disliked by the bees; by conduction they waste heat, and by separation prevent its generation by the groups of workers. Fence separators, being made of wood, conserve the heat, and by the lattice-like construction allow all the bees in the super to share the task of generating warmth.

Another great difference in sections is the way they are cut to receive the foundation. Without enumerating them all, I may state that, for ease in preparing them for the crates, the three-side cut is the only one worth consideration. By using these sheets of foundation the full width of the crate may be slipped into as many sections

—three or four as the case may be—as are required, and in one operation. Then, when the crate is filled, the foundation is held firmly without any buckling, or breaking down, and no other fixing is required. We fill crates of thirty-six sections in six to seven minutes. Compare this method with the time required to cut foundation into separate pieces, fit each section with its separate piece, and then, put each section separately into its crate. Often when the work is done half the pieces of foundation are not perpendicular.

Yet, such is the condition of bee-keeping in this country, that neither fence separators, No Bee-way sections, nor the clipping of queens is general in England. They are the exception. But commerce is a hard taskmistress; yet is she a wise one; for efficiency is her goal, and by efficiency men learn the right. *John Marie.*

## MARKET FRUIT GARDEN.

WITH a total of 3.37 inches of rain, February had well over an inch above the average precipitation. This caused little interruption to outdoor work, however, as most of the rain fell at night. This has been characteristic of the winter months, with the pleasing result that less than the usual amount of time has been practically wasted on made-up jobs under cover. Although the weather has not always allowed one to do just the work desired, by choosing the job to suit the conditions, good progress has been made; and blossoming time should find few arrears of work if it does not come too early. Winterspraying was finished on my place soon after the middle of the month, every Plum and Apple having received its application of tar-distillate wash. It is fortunate that an early start was made with this work, as the buds of all kinds of fruit trees and bushes were distinctly on the move at the end of February. Those of Apple Beauty of Bath had, in fact, almost reached the "delayed dormant" stage, whilst Gooseberries and Black Currants were showing a little green leaf. It can already be seen that there will be a very full display of Apple blossom, as was almost certain after last year's crop failure combined with a summer of medium rainfall and fair amount of sunshine. It is to be hoped that the buds may yet be held in check by cool weather, so that they may have a good chance of opening in favourable conditions.

### PRUNING OLD TREES.

The shaping of young trees is work which I always do myself; but, during the past winter, I have undertaken more pruning amongst the older trees than I have done for many years. This work is of absorbing interest. There is much satisfaction in tackling a big tree and at the end of half an hour or more, noting its improved appearance. Incidentally, this is really the only way to learn the true condition of such trees. I thought I could tell this by mere inspection, and dictate the required treatment to the pruners. On taking a hand in the pruning myself, however, I find that my estimate is not always correct. It is easy to gain the impression that the trees are more vigorous than they actually are. I am really tackling a problem that is new to me. For many years the main object in pruning has been to steady down growth and induce the formation of fruit spurs. This is easy, as it is a mere matter of reducing pruning to a minimum. Now many of the trees are full of fruit spurs, and I am anxious to keep them growing. More severe pruning is the obvious course; but it is not always easy to do it in such a way as to ensure a response. Where a branch carries a fair length of last season's shoots, it is obvious that the right thing to do is to prune those shoots fairly hard. But, in the case of some varieties, many of the branches have become covered with fruit spurs, and show little or no annual growth. These I am treating by reducing the size of the spur clusters, and heading back into the old wood wherever a dormant wood-bud is to be found. In addition, the growing points so

formed are cleared of fruit spurs for a distance of about six inches. In this way, and with the further help of manure, I hope to force some growth.

### STOCKS FOR APPLES.

Most of my trees were planted long before the East Malling Research Station made available the information about stocks, which should be of great value to present-day planters, if they are wise enough to take advantage of it. It is amusing to turn up the old Field Book and see what stocks my trees are supposed to be on. Some, for instance, are recorded as being on Crab and others on the free stock, as though there were any difference. Similarly, some are described as being on Paradise and others on Doucin, which, in most cases, means that they are really on one and the same stock, since the Paradise of most nurserymen is Doucin. I remember that we went to some trouble to buy Doucin stocks from the Continent, under the impression that they would give a result somewhere between Paradise and Crab with regard to vigour and size of tree. Fortunately, a good many of these Doucin stocks were used to work Bramley's Seedling on; and the trees have proved to be moderate in size and satisfactory as to cropping. For some other varieties this stock has not given me good results, not being vigorous enough for my conditions. Moreover, the trees need staking for a very long time in exposed positions, owing to their poor root-hold, and they are liable to leaf-scorch. As we now know, it is a stock for good garden conditions or for semi-permanent orchard "fillers" rather than for permanent trees in a commercial plantation.

Most of my trees are on the free or seedling stock, and, apart from the uneven result which this is bound to give, I have no reason to be dissatisfied. If I were planting again, however, I should endeavour to get trees on broad-leaved English Paradise (Malling Type 1). Some of the best of my old trees are, I believe, on this stock, and some which I have planted more recently I know are. It is vigorous enough, with most varieties, to give a fairly big tree on a three-foot stem, which is what I want.

I mentioned above that present-day planters have the advantage of being able to buy trees on the East Malling stocks. They must, however, be prepared to go to some trouble to obtain them. Unfortunately, most nurserymen still offer to market growers Apples described as being simply on Crab and Paradise stocks. The former are, I understand, seedlings raised from the pips of cider Apples. With regard to the Paradise, it is necessary to find out which type of Paradise the particular nurseryman uses. In most cases it is Doucin (Malling Type II), commonly known in the trade as English Paradise. A few nurseries, however, supply trees on broad-leaved English Paradise (Malling Type I); and others have a limited but increasing number of trees on several of the East Malling stocks. There is a very strong demand amongst market growers for dessert Apples on Jaune de Metz (Type IX), the most dwarfing of the Malling selections. This is not to be wondered at, considering how attractive these little trees are as purely temporary "fillers" on good soil. They would seem to be ideal, too, for planting in gardens, where they can be given good treatment. These trees can be planted nine or ten feet apart; they come into bearing very quickly and the fruit is of large size and splendid appearance. Owing to their light anchorage, they need to be permanently staked; and the branches must be supported in good seasons owing to the weight of the abundant crop. A tall stake set up through the middle of the tree serves both purposes, as the branches can be slung up to this when necessary.

The advantage to the grower in planting trees worked on the East Malling stocks is that he should secure a uniform lot of trees which can be relied on to fill a given space and to come into bearing within a certain time. He needs to get them from a good source, however, as only reliable nurserymen either raise the stocks from their own stool-beds or do the necessary roguing amongst stocks obtained from the Continent.

### SPRAYING IN AMERICA.

The February issue of *The American Fruit Grower* contains a number of spraying schedules recommended for different districts by their local experiment stations. These must be a valuable help to growers. The schedules are interesting because they show what washes are being used in America at the present time. Lime-sulphur is first favourite as a preventive of Apple scab, Bordeaux mixture appearing far less often in the schedules for this crop. The choice is, no doubt, influenced by the fact that lime-sulphur is useful also against the scale insects which are a serious pest in America. The number of applications recommended is astounding. In New York State, for instance, lime-sulphur at winter strength is to be applied at the delayed dormant stage, followed by two more applications at summer strength between that and the opening of the bloom. After blooming lime-sulphur is used again when the last petals are falling; and the number of still later sprayings is determined by weather conditions. Evidently, if they secure a crop free from scab, they thoroughly deserve it.

For the control of aphides nicotine sulphate is added to the lime-sulphur at one of the pre-blossom applications; and lead arsenate is added at each spraying given after blooming for the control of caterpillars. The Americans do not appear to have discovered the tar distillate washes; but they are enthusiastic about miscible oil or lubricating oil emulsion washes for the control of aphides and San Jose scale. One, at least, of these miscible oil washes is now obtainable in this country, and will, no doubt, be tried by a good many growers this year. The best time to use it appears to be at the pink bud stage or shortly before, when most of the aphides, suckers, and caterpillars have just hatched. It serves, in fact, as a substitute for nicotine, and is cheaper. In one trial at Long Ashton oil emulsion gave a promising result against capsid bug; but at present this wash cannot be recommended on anything more than an experimental scale. The vendors make much of the fact that it softens the bark and invigorates the tree; but does the bark want softening? Americans, on the other hand, seem to be rather nervous as to the effect of the oil on the tree if used repeatedly. I understand, however, that miscible oil washes have long been employed in Australia. A Tasmanian grower who came to see me some years ago spoke highly of them, and was surprised that we did not use them in this country. *Market Grower.*

## VEGETABLE GARDEN.

### BEANS.

THE various kinds of Beans will furnish a supply of pods from early June, when the earliest Broad Beans are fit for use, to well into autumn, or until Runner Beans are destroyed by frost.

The Broad Bean is easily grown and not particular as to soil, but does best in ground which is moderately heavy. It is a fairly hardy plant and the seeds may be sown during November on some soils with a certain measure of success. This sowing may be followed by one made about the end of January or early February, and later at intervals until May, although such late sowings are seldom practised. For an early supply, and in those districts where soil conditions are not favourable to early sowing in the open, plants may be raised under glass in the beginning of the year and transplanted out-of-doors about the first week in March. The seeds may be sown in single rows made two feet apart, allowing ten inches between the seeds, or in double rows one foot apart and three feet between each double row alternating the seeds at twelve inches in the rows. All Beans transplant exceptionally well, and it is advisable to sow a few extra seeds with a view to replacing any that may fail to grow. Frequent hoeings and a sharp watch for pests must be maintained. Should weevils attack the plants, spray them immed-

ately with arsenate of lead. A more serious pest is the Bean aphid which should be dealt with so soon as it appears by spraying with nicotine and soft-soap. The topping of the plants when they have reached a fair height will do much to check this pest, and it also assists the pods to fill.

When Broad Bean plants have made a certain amount of growth they afford some protection to other plants of a less hardy nature, which are often grown as an intercrop.

Although it is possible to produce Broad Beans under glass it is not done to any great extent as it has a serious rival in the more popular French Bean. Broad Beans are roughly divided into three groups: Dwarf Fan-podded, Windsor and Long-pods. It is from the two last that varieties are usually chosen for ordinary cropping. Early White-eyed, Broad Windsor Selected (white-seeded), Giant Green Windsor and Green Harlington are some of the best of the Windsor class. The Longpods are probably looked upon as the most useful type of this vegetable: Champion Longpod, Bunyard's Exhibition (white-seeded), Green Leviathan and Green Giant are all excellent varieties of this type.

The Dwarf French Bean is a useful crop, but is somewhat tender and cannot be sown with safety in the open until the end of April, even in favoured localities. The plant is partial to a fairly rich, light soil, and a sunny position. Successional sowings may be made in the open until early July, except in cold districts, where the sowing period is not so extended. Here, again, the method of sowing may be performed either in single rows made about eighteen inches apart, allowing eight inches to ten inches from plant to plant, or in double lines a foot apart alternating the plants at ten or twelve inches and allowing two-and-a-half feet between the sets of double rows. This crop usually gives little trouble, but frequent hoeings are essential.

Picking generally commences about ten or twelve weeks after sowing, and to prolong the season it is important to keep the plants picked over frequently, never allowing the pods to get old. To produce a continuous supply of pods, fresh sowings should be made at intervals and in various places. To follow those grown entirely in the open a sowing should be made towards the end of July, either in the open with a view to covering the plants when this becomes necessary, or in frames, with the lights removed until the weather necessitates their use. A further sowing under similar conditions should be made in about three weeks' time. About the middle of September, and again a few weeks later, sow in pits which can be heated in cold weather. From November to February periodical sowings may be made in pots under glass, where a temperature of 60° to 65° F. can be maintained, using a light, rich compost. When the plants are growing freely it will be necessary to give them some sort of support, Birch twigs being useful for the purpose. A fairly moist atmosphere should be maintained by syringing whenever the weather is favourable, to prevent red spider infesting the plants. If desirable, these Beans may be grown in heated pits, frames or hot-beds, to continue the succession. A sowing made in a cold frame early in April, the plants being transplanted later to the open when all danger of frost is past, will complete the cycle.

There are large numbers of good varieties of this Bean to choose from, although many which are alike, or similar, have different names. There is a great variation in the colour of the seeds of the various varieties.

For early sowing choose Fifty Days or Early Fortyfold, followed by a selection from the following varieties: Masterpiece, Bounteous and Superlative. A good stock of Canadian Wonder is indispensable for certain districts; and King of the Wax is an exceptionally good dwarf Waxpod. For forcing purposes Early Favourite, Osborne's Forcing and Masterpiece may be recommended. The climbing form of this Bean may be grown in the same manner as the Runner Bean, but is not so robust and does not require so much space. Tender and True, July, and Phenomène are varieties of merit of this type; Golden Butter is one of the best of the climbing Waxpods.

The Runner Bean is rather more tender than the

French Bean and should not be sown in the open before the early days of May. A second sowing may be made early in June and another towards the end of that month. For a continuous supply it is not necessary to make many sowings, as the crop from one batch extends over a considerable period. Any good garden soil is suited to this plant, but it prefers ground on the light side which has been deeply cultivated and is in good heart. A little shade from the mid-day sun is an advantage. Two distinct methods can be adopted for growing this vegetable; one is to sow in rows or specially prepared trenches, alternating the plants about ten inches or twelve inches apart. A minimum distance of seven feet should be allowed between the rows. An excellent plan is to place the rows at even a greater distance, and intercrop with some other vegetable. Various methods are employed for supporting Runner Beans, but whatever is adopted, attention must be paid to the training of the young growths during their early stages, and when they have reached the top of the supports they should be stopped. The other method is to treat the crop as is the custom in market gardens, sowing in drills three feet apart, and so soon as the plants begin to turn they should be pinched, repeating the operation as often as the growths are developed, which does away with the necessity of supports. Good crops are produced by this system, but the disadvantage is that the pods are often gritty.

Disappointment is sometimes caused by the Beans failing to set during the early stages of growth, especially during dry weather. Syringing the plants in the early mornings will do much to obviate this; when the lower pods begin to form little further trouble will be experienced.

Progress has been very marked in the improvement of varieties, which vary in length and width of pod. Where only medium-sized pods are desired, Scarlet Emperor should prove useful. Prizewinner or Best of All will furnish pods of large size. Czar is one of the best of the white-seeded varieties, and Hollington Dwarf a good variety when the pinching method is adopted. J. Wilson, Wisley.

#### STACHYS TUBERIFERA.

CHINESE Artichokes, if still in the bed, should now be lifted and stored in sand for use as required.

Good tubers should be selected and planted in a well-prepared, warm border, enriched with leaf-mould, for this vegetable revels in a loose root-run. The tubers should be planted in rows, fifteen inches apart, and about eight inches between the sets in the rows. H. H.

### FRUIT GARDEN.

#### BIENNIAL CROPPING OF APPLES.

ON p. 166, *Market Grower* refers to American Apple growers using nitrate of soda two or three weeks before the trees flower to counteract biennial cropping; and that, incidentally, it gave them a better set of fruit.

Had he said a dressing of potash and phosphatic manures I might have agreed with him, but not nitrate of soda—which, if applied on a grass orchard, only encourages a lot of coarse, rank grass, which no animal will eat. Grass should be kept closely cropped under Apple trees so far as possible. I know it cannot be done when the fruits are nearly ripe, but so soon as the trees are cleared it must be eaten down. I have had to have it cut with a scythe to prevent injury to the trees when nitrogenous manures were used, which is not so good for the trees or the land, as when it is eaten off by stock.

The climatic conditions are totally different in England, and what may give good results in America might have the opposite effect here.

If grass orchards were dressed with potash and phosphates for a few years, one would not see the great areas of Buttercups and Plantains usually seen in English orchards and meadows. The result would be finer grass and better Apples. Grigor Roy, Stoke D'Abernon Manor, Cobham, Surrey.

### HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Deep Trenching.**—E. D. has asked for readers' views on deep trenching. We have always given as much time as possible to ordinary bastard trenching, but one year we followed Mr. Beckett's method of bringing the subsoil to the top, and planted it the following spring with Potatoes. The result was a tremendous crop with enormous-sized and grotesque tubers—utterly misshapen and quite unsaleable. Could Mr. Beckett throw any light on the subject? E. Heathcote, The Eastfield Marais, Williton, Somerset.

—The deep trenching which Mr. Beckett advocates and practices with such splendid results (p. 135) may mean disappointment to some of the younger men, as I am afraid many of them are great copyists. By this I mean, they merely copy what they read or other men do, quite forgetting that rarely do two men obtain equal results in the same way. Before trenching, drainage has to be considered to carry off superfluous water easily and in reasonable time, or the soil will become sour and acid. After trenching, the lime content of the soil should be ascertained, for if the soil is alkaline, the best results cannot be obtained, neither will the produce be as good for food. A dressing of ground lime helps to break up the soil, and renders the various plant foods available. Failing the means or time to trench at all, growing Celery in rotation all over the garden is a good substitute, as by taking out the trench three or four spits deep, we bring a portion of the bottom on top, and the extra depth of trench may be filled with any clean garden refuse. When earthing the Celery for blanching the intervening space is broken up, and the next time Celery is occupying the same site, arrange the trench midway between the previous trenches. Grow as much Celery as convenient for use from September to May, as doctors tell us this vegetable prevents rheumatism. Some years ago, when trenching a new kitchen garden three and four spits deep, bringing the bottom soil to the top, I found the small seeds took a long time to germinate, and the subsequent growth was slow. Another thing I noticed was that when some of the bottom layer was turned in, it remained rough for four years, thereby draining the soil far too much; the lower spit of soil should be pulverised. As to the back-aching part of the work, no man of average health and strength need fear this, if he knows how to handle a spade or fork. The proper use of these tools should make all the muscles supple, and if it makes one tired then health and appetite are improved. Mr. Beckett tells us that by deep trenching we may increase production by seventy-five per cent; that is we turn one shilling into one-shilling-and-ninepence. J. E.

**Subscriptions to the Royal Caledonian Horticultural Society.**—My attention has been directed to the report of the Annual General Meeting of this Society published in your issue of 20th ult., which states that the Council, having regard to the financial position and the fact that the 5s. membership involved a loss to the Society, proposed to increase the annual subscription to 7s. 6d. This is not quite correct. What the Council's Report stated was that according to the Bye-laws of the Society, the 5s. membership subscription is "available for gardeners and nursery or horticultural employees only," but that a number of members who pay 5s. subscriptions do not come within that description. The Council, accordingly, was considering increasing to 7s. 6d. the annual subscription of members on the 5s. list who are not gardeners or nursery or horticultural employees, but there was no suggestion that members eligible under the terms of the Society's bye-laws should be asked to pay more than 5s. The terms of subscription are £1 1s., 10s. 6d. and 5s., the last being for "gardener" members only. Donald Mackenzie, Secretary, R.C.H.S.

## SOCIETIES.

## GLASGOW SPRING SHOW.

THE exhibition of spring flowers promoted by Messrs. AUSTIN AND MCASLAN was held in the McLellan Galleries from March 2 to March 4, and was largely patronised by the general public and Scottish horticulturists. Two halls were required to accommodate the exhibits, and the display reflected an encouraging advance on that of last year, both as regards the variety of the subjects and the quality of the blooms.

A prominent feature which contributed to the success of the show was the attractive exhibits staged by private gardeners. Notable in that respect was the large group of Orchids from Mr. R. Paterson's Stamperland collection. It consisted of 120 plants, representing choice examples of *Cymbidium*, *Cypripedium*, *Dendrobium*, *Cattleya*, *Miltonia* and *Odontoglossum* hybrids tastefully arranged by Mr. Merry, Mr. Paterson's gardener. Among the outstanding specimens were *Cymbidium* Ceres, C. Moira, C. Miranda Golden Oriol, *Odontoglossum* Orosius, O. Aurola, O. Molly; *Dendrobium* Wardianum. *Miltonia* William Pitt, *Cypripedium* Robert Paterson, C. Lady Leon, C. Boltonii (white), and C. Olympus, var. The Chairman.

A beautiful colour display was provided by Lady Muir, Deanston House, Doune (gr. Mr. William McCarroll). It consisted of seedling *Cyclamens*, *Primula obconica* and *Begonia* Mrs. Peterson, staged in effective groupings with a background of *Erlangea tomentosa*. The exhibit of Mr. CLAUD A. ALLAN, Kilmahew (gr. Mr. F. Dunbar) occupied a space of fourteen feet by six feet, and consisted exclusively of a large collection of *Cyclamen* seedlings in five- and six-inch pots, which were remarkable for their large size, varied colours of the blooms, and fine foliage. A smaller, but equally interesting group of *Cyclamens*, was exhibited by Mr. H. ERSKINE GORDON, Aitkenhead, Cathcart (gr. Mr. N. Shannon).

A stand composed of *Primula malacoides*, which included a fine specimen of the Courtland Seedling, also *Primula obconica*, arranged with a setting of *Eupatorium odoratum*, was put up by Lieut-Col. NORMAN KENNEDY, Doonholm, Ayr (gr. Mr. John Gowan), and gave variety to the exhibits. Sir JOHN REID, Ardencraig, Bute (gr. Mr. John Davidson), displayed a representative collection of Daffodils and Tulips numbering twenty-six varieties, while Mrs. PATON, Holmglen, Carmunnock, showed a grand collection of Daffodils in pots of which Tresserve, Bath's Flame, King Alfred, Olympia, Sunrise and Seagull were outstanding varieties. The new *Hyacinth* Van Tubergen's Scarlet was also prominent in the exhibit.

The only exhibit of Carnations was shown by Sir A. B. CAYZER, Gartmore (gr. Mr. H. B. Matheson). Mr. WALTER CURRIE, Castle Levin, Gourcock (gr. Mr. C. Trail), exhibited a seedling *Cupressus*.

Messrs. AUSTIN AND MCASLAN's half-dozen exhibits were an object lesson in the varied uses of decorative nursery stock. The principal section was a terraced garden with stone frontage which extended across one end of the hall. *Hyacinths* planted in soil formed the foreground and flanked a central group of *Rhododendron* *Cynthia*, while a background of Weeping *Pyrus*, *Laburnum* *Vossii* and *Wistaria* completed a colour picture the beauty of which was accentuated by a square bed of Tulips and *Hyacinths* planted in quartered form and edged with turf. Massed groups of *Azalea indica* and *Rhododendrons* in variety occupied the central floor space, and the other end of the hall was occupied by a rock garden containing several rare alpine plants in flower. The background was filled with brilliant drifts of Japanese *Azaleas* in full bloom, of which the specimens *Hinomanyo* and *Benegira* were particularly fine. Immediately in front was a table of established specimens of modern novelties of *Saxifraga*, *Primula* and *Cupressus*. An extensive collection of pot plants was the centre of attraction in the adjoining hall, including well-grown *Wistaria*, *Viburnum Opulus*, Weeping

*Cherries*, *Laburnum Moseri*, *Genista*, *Lilac*, *Prunus triloba* and *Forsythia suspensa*.

The competitive section of the show consisted of fifty-nine classes. Over two hundred entries were received, and the quality of the blooms was of a very high standard. Mr. HECTOR FRASER, Paisley, who had thirteen first prizes to his credit, again won the special prize for the best amateur exhibit in the show, with six magnificent bowls consisting of *Narcissus* Sir Watkin and Van Waveren's Giant, double Tulips, *Azaleas*, single Tulip Prosperine, miniature *Hyacinth* Marconi and single *Hyacinth* La Victoire, the former having twenty-five and the latter seventeen grand blooms. Other principal prize winners were Mr. CLAUD JENKINS, Cambuslang (eight firsts); Mr. JOHN RUSSELL, Newton Mearns (seven firsts); Mr. HENRY SMITH, Kilmarnock; Mr. PETER BANCHOP, Alexandria; Mr. JAMES McLAREN, Milngavie; Mr. JAMES BLACKSTOCK, Motherwell, and Mr. JAMES McCRAW, Crosshill.

In the gardeners' section the three pots of *Cyclamen* staged by Mr. WILLIAM MCCARROLL, Deanston House, were awarded the special prize offered for the best exhibit.

## VALE OF EVESHAM ASPARAGUS GROWERS'.

THE third annual general meeting of the Vale of Evesham Asparagus Growers' Association was held at Badsey on the 16th ult. In the absence of the President, Mr. C. A. Binyon, J.P., Mr. R. R. Smith presided.

The Secretary, Mr. A. S. Boaler, announced that the research work being conducted by the Long Ashton (Bristol University) Research Station, for the purpose of solving the "sick" land problem, would not entail any expense to the Association, as there was a special Government grant to cover that work. He presented the accounts which showed a credit balance on the general account of £36 16s. 10d.

Mr. C. A. Binyon was unanimously re-elected President and thanked for his services; Sir Julius Sladden, C.C., Mr. James Ashwin, J.P., and Mr. A. Woodall were re-elected Vice-Presidents; and the general Committee, which includes representatives of all the Asparagus-growing villages in the district, was revised. The Secretary, Mr. A. S. Boaler, and the Treasurer, Mr. Ernest Mustoe, were re-elected.

It was decided to devote the profits of this year's show to the Evesham Hospital Extension Fund.

With reference to the "sick" land problem, which is of vital importance to Asparagus growers, who complain that after a few years their land becomes "sick," and will not produce Asparagus in anything like the quantity or quality previously, Mr. T. Wallace, of Long Ashton Research Station explained the experiments being conducted at Bristol. At Long Ashton, he said, Mr. R. M. Nattrass was at work on the disease side of the problem, and had laid down plots of four varieties of Asparagus upon which he was experimenting. He was also trying to find what methods of control (if control could be exercised) he could obtain over the disease known as *Rhizoctonia*. For this purpose he was experimenting with Carrots, which are also subject to this disease. He also had roots of Asparagus which showed signs of a second fungus—*Fusarium*, and was looking into this matter with Dr. G. H. Pethybridge, Mycologist to the Board of Agriculture. He (Mr. Wallace) was at work on the nutrition side. He had laid down some plots on Mr. J. Hall's land at Bretforton, on which they were carrying out different methods of treatment, and this year they hoped to follow through the history of the Asparagus bed. He urged the growers to give the Long Ashton authorities every assistance.

Mr. G. C. Maltby, of the Ministry of Agriculture, said that imported Asparagus was improving in quality and packing; there were other districts too, although perhaps not so well-favoured as theirs, where Asparagus was being grown for market, and he urged them to give all the help they could to Mr. Wallace.

## READING AND DISTRICT GARDENERS'.

THE fortnightly meeting of this Association was held on February 21. The President, Mr. Frank E. Moring, occupied the chair.

Mr. W. G. Fry, a student of the University Gardens, Shinfield, gave a lecture on "Kew Gardens."

In the competition for six spathes of *Richardias* (Arum Lilies), many splendid exhibits were shown. The first prize was awarded to Mr. A. W. GOWER, Calcot Grange Gardens; the second to Mr. F. G. RABBITS, Bulmershe Court Gardens; and the third to Mr. G. CARTER, Chazey Hill House Gardens, Mapledurham. Magnificent plants of *Primula malacoides* were shown by Mr. F. TOWNSEND, gardener to Mr. Leonard Sutton, Hillside, Reading. A First Class Certificate for Cultural Skill and the congratulations of the Association were awarded to this unique and instructive exhibit.

## CARDIFF AND DISTRICT GARDENERS'.

At the fortnightly meeting held at the Queen's Hotel, Cardiff, on March 1, Mr. J. Hall presided, and the members, including ladies, had the privilege of listening to an excellent lecture on "Welsh Flora," by Miss E. Vachell. Miss Vachell dealt admirably with the species of wild plants to be found amongst the mountains, sand dunes, and valleys of north and south Wales. She laid stress on the disadvantages and advantages of past and present days, and sadly regretted the annihilation of some rare species by collectors. Her remarks were ably illustrated by lantern slides.

An interesting discussion followed in which Mr. J. T. Smith, Duffryn Gardens, took the leading part, followed by J. Allen Gibbs, Esq., and other members. The lecture was thoroughly enjoyed and many were amazed to know that so many beautiful plants grew wild in Wales.

## SPALDING FLOWER SHOW.

THE Spalding and District Bulb Growers' Association held its annual show of forced blooms in the Corn Exchange, Spalding, on Saturday, February 26, when there was a very notable display and a good attendance of growers and others. The competitions are open to members of the Association only.

The exhibits of Mr. O. W. D'ALCORN, of Spalding, won the Parsons' Challenge Cup. Consisting chiefly of Daffodils and Tulips, the blooms were advantageously displayed on conical-shaped tiers. The variety Whistler, which is one of the largest Daffodils grown for commercial purposes, figured prominently with others, such as King Alfred, Spring Glory and Van Waveren's Giant. Mr. D'ALCORN won the Parsons' Cup two years ago, but it has to be won three times before becoming the property of a competitor.

Messrs. J. T. WHITE AND SON, of Spalding, who were reserve for the Cup, staged some remarkably fine Daffodils, and were awarded first prize for a box of Trumpet *Narcissi*, tied and packed as for market.

Mrs. H. BATES, of Spalding, won three prizes. Her Tulips were the best in the exhibition, some of the others showing signs of having been too severely forced.

The awards were as follow: Parsons Challenge Cup, Mr. O. W. D'ALCORN, of Spalding; second, Messrs. J. T. WHITE AND SON, of Spalding. Collection of forced bulb flowers: First, Mr. O. W. D'ALCORN; second, Messrs. J. T. WHITE AND SON.

Cut *Narcissi*: First, Mrs. H. BATES, Spalding. Collection of Tulips: First Mrs. H. BATES; second, Mr. B. BAXTER, Spalding.

Box of Trumpet *Narcissi* (packed for market): First, Messrs. J. T. WHITE AND SONS; second, Mr. G. N. WRIGHT, Whaplode; third, Mr. F. BAXTER, Spalding.

Box of *Narcissus ornatus*: First, Mr. B. BAXTER.

Bunch of forced flowers: First, Mrs. BATES; second, Messrs. J. T. WHITE AND SON; third, Mr. G. N. WRIGHT.

## WESTERN COMMERCIAL SHOW, PENZANCE.

MARCH 3 AND 4.—This show is primarily a commercial exhibition, and one of its objects is to improve the growing, packing and marketing of flowers in the Penzance peninsula and the Scilly Islands. The display of thousands of bunches of golden Narcissi and boxes and boxes of the same flowers as well as sweet-scented Violets, Anemones and exotic foliage, presented a grand spectacle. The popularity of the show was reflected in the attendance, which numbered three thousand. The conferences and lectures were crowded with enthusiastic growers from all over the country, as well as numerous salesmen.

The show was opened by Sir Daniel Hall of the Ministry of Agriculture, and he was supported by Mr. H. V. Taylor, Commissioner of Horticulture of the Ministry of Agriculture. Much of the success of these shows is due to the efforts of the Chairman, Rev. A. T. Boscawen, and the President, Lord St. Levan.

In addition to the conferences and lectures numerous competitions were held for Narcissus bunching, Violet bunching and Broccoli packing. New classes were provided for bulb plantations, and eight growers entered their bulb gardens; the winner of the Cup offered for the best bulb garden over two acres, was Mr. F. TREGONING, Gulval, Penzance.

Owing to the lateness of the season, it was a matter of regret that Mr. P. D. Williams had nothing to show, but this was compensated for in some degree by the remarkable collection of flowering and foliage shrubs staged jointly by the Rev. A. T. BOSCAWEN and Mr. WALTERS, Ludgvan. The subjects included *Acacias*, *Erica magnifica*, *Erica melanthra*, *E. lusitanica*, the beautiful *Myrtus bullata*, *Pittosporums* in great variety, and *Rhododendrons*.

Lectures were given by Mr. Gordon Gibson on Eelworms, and by Col. Hurst, on Co-operation. Mr. F. J. Chittenden presided at the flower conference, and Mr. H. V. Taylor at the vegetable conference. At the latter, Messrs. Giles and Oldham gave valuable addresses on Broccoli, one of the staple crops of the district; Penzance exports 1,500 tons of flowers, and 15,000 tons of early vegetables.

Trade firms were well represented. Messrs. SUTTON AND SONS had an excellent stand of vegetables, etc., and other exhibitors were Messrs. RUSE AND SON, Falmouth; Messrs. TRESEDER AND CO., Truro; Messrs. R. VEITCH AND SON, Exeter; Messrs. AVIS AND SON, Penzance; Messrs. G. MONRO, LTD.; Messrs. MOGFORD, TIRKIN AND CO., Newquay; Messrs. GOUGH AND CO., Norwich; and Messrs. PUGH AND CO., Exeter. Bulbs were well shown by Messrs. BARR AND SONS, Taplow, and Mr. J. C. MARTIN, Truro. Educational exhibits were put up by the MINISTRY OF AGRICULTURE, SEALE HAYNE AGRICULTURAL COLLEGE, and CORNWALL COUNTY COUNCIL.

The outstanding exhibits in the show were the wonderful heads of Broccoli. Flowers were also well shown, and the classes for packed Daffodils and Violets attracted many notable exhibits. Other noteworthy exhibits included Tulips, various Anemones and Violets. Over 150 bunches of Violets were shown in classes 47 and 48. Amongst the Narcissi exhibited the best were King Alfred, Golden Spur, Sunrise, maximus superbus and Sir Watkin. The competition in all the Daffodil classes was very keen.

The following are the principal prize-winners: Broccoli.—Six heads of Broccoli, trimmed, any recognised trade variety: first, Mr. T. C. MATTHEWS, Trevean, Gulval; second, PARK FARM, Truro. Six heads of Broccoli, trimmed, raised and grown by the exhibitor: first, Mr. T. C. MATTHEWS; second, Mr. W. D. THOMAS. Three wooden crates of two dozen heads of Broccoli as packed for market: first, PARK FARM, Truro; second, Mr. RICHARD TREGONING, Ridgevean, Gulval. Two similar commercial packages of Broccoli giving a definite count, excluding wooden crates, as in Class 3: first, Mr. J. D. THOMAS; second, Mr. W. D. THOMAS. A returnable wicker hamper to hold two dozen heads of Broccoli or 1 cwt. of Potatoes: first, Mr. J. H. HOCKING, The Cliff, Chyandour, Penzance.

The best Six Cabbages were shown by Mr.

A. WRIGHT MATTHEWS, Pengarth, Mousehole; second, Mr. R. I. EDYVEAN, Torleven Farm, Porthleven. Most convenient and best commercial market package of Cabbage giving a definite count: first, Mr. T. C. MATTHEWS; second, Mr. J. N. THOMAS.

New Potatoes in a market container, weighing 14 lb. net.—First, Col. C. H. PAYNTER, Boskenna, St. Buryan.

The most economical sprouting trays (two), one empty and one containing sprouted sets.—First, Col. C. H. PAYNTER; second, Messrs. JEFFERY AND SONS.

Three market bundles of Rhubarb.—First and second Messrs. J. G. LAITY AND SON, Bostrase, Marazion; third, PARK FARM, Truro.

A packed, non-returnable box of Trumpet Narcissi, open to Cornwall and Scilly.—First, and Special, Mr. H. J. GOODING, Tresco, Scilly; second and Special, Mr. A. MUMFORD, Holy Vale, St. Marys, Scilly.

The best packed box of Polyantha Narcissus (not forced).—First and Special, Mr. A. MUMFORD, Holy Vale, St. Marys, Scilly; second and Special, Mr. F. R. WARD, St. Marys, Scilly.

Mr. H. J. GOODING showed the best six market bunches of Narcissus King Alfred; Mr. A. MUMFORD, the best Golden Spur, and Mr. RICHARD TREGONING, the best six bunches of any other yellow Trumpet Daffodil.

The best six commercial varieties of Narcissi (not forced) were shown by Mr. W. VELLENOWETH, Perranuthnoe, Marazion.

Arums.—Three vases, five flowers to a vase: first Mrs. BOLITHO; second, Mr. R. UREN.

In the vegetable classes Mr. T. C. MATTHEWS excelled for six heads of Broccoli; Mr. S. E. JOHNS, Ludgvan, for six heads of Cabbage; and Mr. J. H. WILCOX, Pendrae Cottage, Gulval, for the best collection to be staged in a space not exceeding six feet of table-run, open to cottagers and allotment holders.

## THE ORCHID CLUB.

At the meeting of the Orchid Club, held on the 11th inst., several extensive groups of great merit were exhibited, in which fine *Odontoglossums* and interesting species were especially noteworthy.

### DIPLOMA OF MERIT.

*Odontoglossum Serapis*.—A large, well-shaped flower, three-and-a-half inches across, the sepals and petals dark crimson, slightly broken with white and with white edges. The large, well-displayed lip is white, with crimson spots at the base. The plant carried a beautiful spike of twelve flowers. From Dr. CRAVEN MOORE.

### DIPLOMA OF DISTINCTION.

*Dendrobium tetragonum*.—An unusually fine specimen of this quaint and interesting Australian species, growing on a raft; it carried a large number of four- and five-flowered spikes from the apices of the curious tetrahedral pseudo-bulbs. The flowers are green, spotted and marked with red. From B. J. BECKTON, Esq.

### GROUPS.

Dr. CRAVEN MOORE (gr. Mr. Gilden) exhibited a highly attractive group composed of some twenty choice *Odontoglossums*, all carrying large spikes, and fine plants of *Ada aurantiaca*, *Brasso-Cattleya Cliftoni magnifica*, and *Lycaste hellemense*. Among the *Odontoglossums* handsome forms of white and blotched hybrid crispums were associated with examples of *O. Eros*, *O. Lobbiae*, *O. Lilian*, *O. Brunhilde*, and *O. Amabelicity*.

B. J. BECKTON, Esq. (gr. Mr. Stewart) exhibited a large group containing many species of exceptional interest, including wonderful specimens of *Coelogyne sparsa*, *Dendrobium delicatum*, *Gomezia planifolia*, *Restrepia striata*, and *Saccolabium bellinum*. There were also several varieties of *Masdevallia*, of which genus Mr. BECKTON has a very complete collection, and fine examples of *Miltonias* and *Cymbidiums*.

Mrs. FRED. HARDY showed some beautifully-flowered *Dendrobiums* and *Lycaste Skinneri*

*Hardyana*, a particularly fine variety that has been in cultivation at Tyntesfield for more than thirty years.

A. T. CUSSENS, Esq. (gr. Mr. Dalgleish) exhibited a selection of fine *Cymbidiums*, together with *Dendrobiums*, *Lycastes* and *Miltonias*. Of the *Cymbidiums* excellent varieties of *C. Butterfly*, *C. Castor*, *C. Sybil* and *C. Venus* were specially attractive, and among the *Dendrobiums* a beautiful form of *D. Saltrilliae* was admirable by reason of its soft rosy-violet sepals and petals and large, open white lip with a purple tip.

F. T. PAUL, Esq., showed a small selection of interesting plants, including some well-grown *Cypripediums*, the bright, rosy-purple *Lycaste Skinneri* var. *Purple Emperor*, and an exceptionally good form of the new *Dendrobium Merlin*, a seedling of much promise. MORTON JACKSON, Esq., brought some interesting flowers including a pleasing variety of *Phaius*.

## UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

THE sixty-first annual general meeting of this useful benefit and provident society was held at the Royal Horticultural Hall, on Monday, March 14. There was a moderately good attendance, over which Mr. C. H. CURTIS presided.

After reference had been made to the death of Mr. W. P. THOMSON, for many years a member of the Committee, and at one period Treasurer of the Society, a silent vote was taken in memory of the members who fell during the great war.

The reports and accounts of the Society for the year 1926 were presented both in connection with the ordinary and the State sections of the Society's work. In regard to the former, the report showed that during the past year the handsome sum of £3,000 had been invested, thus bringing investments to the very fine total of nearly £73,000. Ninety-three adult and three juvenile members were admitted during the year, and after deducting losses by death and lapsing, the membership now stands at 1,844, or a net increase of 44, as compared with the year 1925. The total income for the year amounted to £6,809 11s. 2d., and the total expenditure, including the investments, to £6,640 8s. 7d. In the year under review the large sum of £1,024 19s. 1d. was paid out to sick members, this being a considerable increase on the amount so paid in the previous year. Aged, chronically disabled and distressed members received £328 14s. 0d., while payments to the nominees of deceased members came to £661 8s. 11d., and funeral benefits, £225. Withdrawals from interest on deposit accounts totalled £122 17s. 1d., while members over seventy years of age withdrew sums from their deposit account amounting to £580 1s. 4d.

The record of attendances of officers and members of Committee is a particularly good one, especially having regard to the fact that several members come a very long distance to attend to their duties.

The adoption of the report and accounts was moved by the Chairman, seconded by Mr. Young, and carried.

Votes of thanks were accorded to Mr. A. Bedford, the treasurer; to Messrs. J. Hudson, Riley Scott and C. H. Curtis, trustees; and to the horticultural press for services rendered. The auditors, Messrs. Gunner and Puzey, were re-appointed, and it was pointed out that these gentlemen had acted in this capacity for a very long number of years, were thoroughly acquainted with the books and working of the Society, and spoke very highly of the manner in which Mr. A. C. Hill carried out his secretarial duties.

A special vote of thanks was accorded to Mr. C. Harding who has a continuous record of twenty-eight years' service on the Committee: the members present agreed that some tangible token of their appreciation of his services should be made. This came as a great surprise to Mr. Harding, who modestly asserted that he had done no more than any other member of the Committee, but he was fortunate in having been able to serve over a longer period than most.

Arrangements were made in regard to the allocation of the funds of the State section to enable the Committee to use a larger amount for the relief of members undergoing dental treatment; one or two other matters were also dealt with, entirely concerned with the State section of the Society's work.

The meeting agreed that on the ordinary side £100 be transferred from the surplus interest account to the advertisement fund.

The Chairman pointed out that the Committee had had under consideration the granting of permission to members over seventy years of age to continue their subscriptions, thereby enabling them to obtain sick benefit, and suggested that in due course the opinion of the members should be invited in connection with this suggestion, and the results placed before the members at an annual or a special general meeting, as the case demanded.

The meeting concluded with a vote of thanks to the Chairman, who had that evening completed twenty-five years' continuous service as Chairman of Committee.

### SPALDING BULB GROWERS'.

MEMBERS of the Spalding and District Bulb Growers' Association are anxiously awaiting the result of a representation made to the Chancellor of the Exchequer for a duty on imported bulbs, which, if adopted, would completely change the outlook of the industry in the Fens, which is at present flooded with imported bulbs, many of which are of dubious quality.

Mr. A. W. White, President of the Spalding Association, speaking at the annual dinner of the Association, last week, said that it would mean that many more people would be employed in the industry if bulb growers had some form of protection or preference. Referring to the new Rating Act, he said bulb growers were hoping that glass-houses would get seventy-five per cent. relief, as in the case of agricultural buildings. There were many anomalies in the rating of glass-houses at present. As showing the need for fair valuation, he said that the rating of glasshouses in some cases varied from 2s. 9d. per 100 feet of ground covered to 17s.

An Oak timepiece was presented to Mr. H. W. Quincey in appreciation of his many years' services as Secretary to the Association. The presentation was made by the Chairman (Mr. A. W. White), and carried through with enthusiasm.

### ROYAL CALEDONIAN HORTICULTURAL.

THE March meeting of this Society was held at 5, St. Andrew Square, Edinburgh, on the 1st inst., Mr. W. J. Thomson, President, in the chair.

A highly informative paper on "The Violas of Europe," by Colonel E. Enever Todd, was read by his sister, Miss Alice Todd. Colonel Todd made brief reference to the close connection which the evolution of the garden Viola, Violet and Pansy had with Edinburgh, where the hybridisation of them had been carried on by the late Mr. James Grieve, many years ago, as well as by the late Dr. Stuart, of Chirnside, Berwickshire, and others. Colonel Todd stated that the genus Viola was almost cosmopolitan in its distribution, and extended from the Arctic to the Antarctic, and from sea level to over 14,000 feet above it. He entered very fully into the classification of the European species, with the most of which he had made a personal acquaintance in their native habitats, and referred in detail to many of the more important species. He has paid much attention to the genus for some time, and the paper marks a distinct advance in our knowledge of this interesting family, about which, with the exception of the few species which have played such an important part in the evolution of the garden forms, comparatively little seems to be known.

The exhibits consisted of Rhododendron blooms from Miss BARRY, Edinburgh, and an Acacia from Aden, by Mr. R. L. SCARLETT, Sweethope, Musselburgh.

## Obituary.

**Robert Cockburn.**—On Tuesday, the body of Mr. R. Cockburn, gardener on the Dunragit estate of Viscount Inchcape, was found in a dam near the saw-mill. Deceased, who had been in bad health, went out on the previous day, and in the evening his cap was observed floating in the dam, and when the water was run off the body was recovered.

**Richard Gill.**—It is with the deepest regret that we announce the passing of Richard Gill, of the firm of R. Gill and Son, the Rhododendron specialists of Penryn and Falmouth, at the age of seventy-eight years. By his death, horticulture loses one of those veterans who are so hard to replace; he was a great and successful gardener. Mr. Gill was one of the pioneers of the cultivation and raising of hybrid Rhododendrons, many of which are named after him and his family, while the exhibits of the firm at the leading shows have demonstrated his fine work. He raised several remarkable hybrid Rhododendrons, many of which have occupied a prominent place in gardens throughout this country and other parts of the world, especially

THE LATE RICHARD GILL.

New Zealand. In his earlier years, Mr. Gill was well-known throughout the west of England as an exhibitor, where he was successful with stove plants, Orchids, Chrysanthemums, Azaleas, etc. The Azaleas he grew were greatly admired, many of them being perfect sugar-loaf specimens six feet to eight feet in height; later he devoted his energies to Rhododendrons of the Himalayan and Chinese sections, with great success. He had a kind, gentle, unassuming disposition, and was greatly loved. He leaves a widow, a daughter, and two sons—Councillor R. E. Gill, of Falmouth, and Mr. H. T. Gill, who is in India.

**Alfred Moore.**—The death occurred, in sad and mysterious circumstances, on the 7th inst., of Mr. Alfred Moore, the Superintendent of Broomfield Park, Palmer's Green, north London, at the early age of forty-nine. At the inquest it was stated that Mr. Moore, who was apparently in his usual health, was missed on Monday morning, and about an hour later his foreman and four assistants discovered the body in the park lake. The punt which he was in the habit of using was in the centre of the lake. A week or two ago, it was stated, he complained to his wife of having had an accident and injuring his knee through slipping in the punt, and the theory advanced yesterday was that he slipped and fell over the side. Medical evidence showed

that he had signs of heart disease, and a sudden attack might have caused him to lose his balance. A verdict of accidental death was recorded.

**Ion Haseganu.**—We learn with the greatest regret of the death, at the end of January, at the comparatively early age of sixty-two years, of M. Ion Haseganu, Principal of the Horticultural College at Bucarest, Roumania. Following only a year after that of M. Stefanescu, whose death we announced in our issue of February 27, 1926, M. Haseganu's loss is an irreparable one to Roumanian horticulture, and it will be very difficult to find his successor at the College, or in the many other horticultural and allied functions which he performed with so much devotion and skill. Curiously enough, M. Haseganu began life as an actor, having gained a prize for declamation at the Bucarest Conservatoire, and being subsequently engaged at the National Theatre, after which he went on tour and won considerable distinction in the profession. His love of nature asserted itself, however, and he began a course of study at the Herestrau School of Agriculture, after which he proceeded to the Versailles College of Horticulture, returning to take up a position in the Municipal Gardens of Bucarest. His rise was rapid, and when the new Bucarest College of Horticulture was completed, he was placed in full charge and undertook the heavy task of creating from the beginning every department. His zeal and knowledge were equal to the task, but not so his physical strength, and he contracted a chill to which he succumbed. He was one of the founders and original members of the Roumanian Horticultural Society, and had been elected honorary President; he was also "Conseiller Agronome," and professor at the Herestrau School of Agriculture. The creation of a national Horticultural College at Bucarest had been his ambition for over thirty years, and it is sad that he should scarcely have lived to see any fruition of this almost life-long desire. Both he and M. Stefanescu sowed that others might reap.

## ANSWERS TO CORRESPONDENTS.

**KEW FLAG-STAFF.**—*E. B. G.* The Kew flag-staff was erected on October 18, 1919, having been presented to Kew by the Provincial Government of British Columbia to replace the old flag-staff of Douglas Fir which was 159 feet high and calculated to be about two hundred and fifty years old. The Douglas Fir selected for the new flag-staff was found some thirty miles north of the city of Vancouver, and was conveyed by rail and water to Vancouver, and then shaped to its present form by expert axemen. It is square at the base for fifteen feet up, then octagonal up to 157 feet, thence to the summit (214 feet) it is round. A full account of the flag-staff was published in *The Gardeners' Chronicle* for January 24, 1920.

**NAMES OF PLANTS.**—*C. F. Smith.* 1, *Centradenia floribunda*; 2, *Strobilanthes isophyllus*. *P. H. M.* 1, *Trichocaulon Pillansii*; 2, not recognised; send in flower; 3, *Begonia conchaeifolia*.

**PEAR MIDGE.**—*F. I.* Pear midge is a very difficult pest to deal with. On a small scale the best plan is probably to remove and burn about three inches of the surface soil from beneath the trees. This destroys the pupae, so that the midges do not hatch in spring. Another remedy is to collect all the affected young fruits before they fall to the ground, and burn them. This prevents the larvae from entering the soil to pupate. A similar result is obtained by coating the surface soil with kainit early in June. It might be worth while to experiment with one of the advertised soil fumigants, or with calcium cyanide. The vendors of the latter would, no doubt, suggest a method of treatment.

REMARKS.—Supplies throughout this department have been on the increase generally during the past week and requirements fairly good considering that there is usually less demand for coloured blooms during Lent.

More Daffodils are coming from home-growers, including some very fine blooms of Madame De Graaff and other choice varieties. There are also some special Narcissus, such as Horace, Elvira, Barril and other imported varieties. N. ornatus has remained firm in price owing to limited supplies during the week. Richardias (Arums) have been too numerous during the past week and their prices have been the lowest so far this season. Lillium longiflorum of the formosanum type is very fine in quality and also cheaper. Lily-of-the-Valley has become scarce, but small consignments from Holland have relieved the situation; these imported spikes are of good quality. The prices of Carnations are similar to those quoted last week; there is a shortage of really good blooms, and the prices fluctuate according to quality from 2/6 to 5/- per dozen blooms. Roses are more plentiful but they are mostly of the variety Richmond; other sorts will be greatly welcomed. A few blooms of mauve and yellow Spanish Irises have been on sale. Single Violets have been almost a glut for several days past. More Primroses and Polyanthus are being received from growers. Supplies from the Channel Islands are on the increase. Daffodils are the cheapest subjects from this quarter and include Golden Spur, Emperor, Henry Irving, princeps, Sir Watkin and Victoria; similar varieties are also being received from Cornwall; these blooms are generally good in quality, and being cut in a more backward condition are more reliable for re-dispatch to the provinces.

REMARKS.—Business has been variable but has shown some expansion in volume, as is the normal for the period of the year. Probably Cape fruit is the most important produce on the market; shipments are comparatively heavy and consist mainly of Peaches, Plums, Pears and Grapes. Apples from North America are not a good trade just now; it is expected that the first New Zealand Apples, due next week, will prove more popular. A sprinkling of English Apples is still available, but the only variety selling even moderately well is Bramley's Seedling. Strawberries and Grapes from Belgium are selling fairly well. Oranges from Spain are inclined to be cheaper, and the situation in the Lemon market is practically unchanged. Choice vegetables, such as French Beans, Peas and new Potatoes are a steady trade; Beans are more plentiful and cheaper. Asparagus is in greater supply

and is cheapening in value. A few English Tomatoes are on sale, but are very dear. Tomatoes from the Canary Islands are selling slightly better this week. Cucumbers are cheaper, the quantities being on the heavy side for the time of year. Trade in forced Rhubarb is weak owing to increasing quantities of natural Rhubarb. Cauliflowers have been a variable business, supplies being heavy from St. Malo, Guernsey, and the West of England. Mushrooms are still plentiful, but their prices are fairly steady. Salads from France are selling well. Business in green vegetables is slow and disappointing to the growers. New Potatoes from Algeria and the Canary Islands are cheap. Trade in old Potatoes is unchanged.

## GLASGOW.

Price movements in the cut flower market displayed considerable irregularity, and the changes were mostly in a downward direction. Tulips were cheaper, except Tea Rose, which realised 1/4 to 1/6 (6's), while Lueria was worth from 1/- to 1/4; Ibis, 1/3; Bartigan and William Copland, from 10d. to 1/3; Prince of Austria and Couronne d'Or realised 10d. to 1/2; Flamingo and La Reve, 10d. to 1/-; and Murillo, 9d. to 10d. Outdoor-grown Daffodils are arriving in larger quantities and sold freely at 2/- to 3/- per dozen bunches; and indoor blooms made the following prices: King Alfred, 10d. to 1/4 per bunch; Glory of Lisse, 9d. to 10d.; Sir Watkin and Emperor, 6d. to 8d.; Golden Spur, 5d. to 8d.; ornatus 6d. to 7d.; and Narcissus, 3d. to 4d. Prices of Carnations ranged from 4/- to 5/- per dozen; Lily-of-the-Valley, 2/- to 2/6 per bunch; Lilac, 1/6 to 2/-; and Mimosa, 5/- to 6/- per cane. Violets were plentiful and cheap at 3d. to 6d. per dozen bunches. Richmond Roses realised 4/- to 6/- per dozen, and first consignments of Wedgwood Iris sold for 5/6 per dozen spikes.

Business in the fruit market continued quiet. Jaffa Oranges advanced 3/- per case to 22/- for 144's, single chalks, and 24/- for 180's and 240's. Two chalks were 1/- and three chalks 1/6 less. Californian seedless Oranges averaged 27/- per case, and a first importation of Port Rico Oranges made 20/- per case. Grape Fruit from the latter place fluctuated between 21/- and 24/-. Prices for Apples were steady. Winesap (fancy) made 13/- to 14/- per case; Greening, 29/- per barrel; Baldwin, 26/- to 27/-; Ben Davis, 18/- to 22/-; and York Imperial, 22/- to 25/-; Kosaki brands of Cape fruits were superior in quality and made good prices as follows: White Grapes 12/- to 14/- per box; Yellow Peaches, 5/- to 6/-; freestone Peaches, 6/6 to 8/-; and Beurre d'Herbe Pears, 6/- to 7/-.

A steady turnover was reported in vegetables. Prices of Lettuce declined to 4/- and 5/- per crate; Dutch Cucumbers varied from 9/- to 14/- per dozen; English Cucumbers 12/- to 15/-; Cauliflowers, 7/- to 9/-; Endive, 3/-; Radishes, 3/- to 3/6; Carrots and Turnips, 8d. per bunch; Madeira Beans, 4/- to 6/- per box; Algerian Potatoes, 3d. per lb; and Rhubarb, 30/- to 36/- per cwt.

## THE WEATHER IN FEBRUARY.

AFTER the first week of February winds from the south-eastern quadrant prevailed almost daily and the month was unusually calm and humid with large variations of temperature from day to night, and from one twenty-four hours to the next. From the 2nd to the 19th barometric pressure was high to very high, but throughout the month the pressure was correspondingly low. The second week of the month was a particularly cold one; most of the final eight days, however, were unseasonably warm. Haze, mists and slight fog were very prevalent, and a striking minimum of ozone characterised the middle of the month. The mean temperature, at a fraction below 40°, was almost exactly normal. So also was the duration of sunshine, at 66 hours. Rain fell on fifteen days, or one fewer than usual, and the total amount was 1.91 inch, or a quarter-of-an-inch below the average. Frost was registered in the shade on eleven dates, and ground frost occurred on fourteen nights. There were no gales, nor was any snow experienced. Hail fell once. Ice was upon the large lake in Hesketh Park on six days, but its thickness always remained under an inch. Joseph Bazendell, The Fernley Observatory, Southport.

## GARDENING APPOINTMENTS.

Mr. F. Lansbery for the past sixteen years gardener to the Hon. Lady Hulse, Breamore House, Salisbury, as gardener to H. MARTIN GIBBS, Esq., Barrow Court, Flax Bourton, Somerset. (Thanks for 1/6 for R.G.O.F. Box.—EDS.)

IF THERE IS REAL QUALITY  
AND GOOD HONEST SERVICE  
behind your advertisements, they  
will pay, and pay handsomely,  
whatever the initial outlay may be.

**"Auto-Shreds" did it!**

I just burnt them on the ground and they thoroughly fumigated my plants. The judge wanted the name of the stuff that kept my flowers so insect-free. I told him "Darlington's AUTO-SHREDS." At all seedsmen. They cost—No. 1 (To fumigate 10,000 cubic ft.) 8/6. No. 2 (10,000 c.f.) Ordinary plants, 4/6. No. 3 (1,000 c.f.) Ordinary or tender plants 1/6. No. 4 (2,500 c.f.) ditto, 1/8. Any difficulty in obtaining write to W. DARLINGTON & SONS, LTD. HARKNEY, LONDON, E.C.

# CALENDAR OF GARDEN OPERATIONS

**Price 2/6, post free 2/10.**

The **CALENDAR OF GARDEN OPERATIONS** is indispensable and unrivalled, because it represents the accumulated experience of over half-a-century. Originally compiled by Sir Joseph Paxton, it has been revised and enlarged by the

staff of *The Gardeners' Chronicle* until it is now as nearly perfect a gardening guide as any that exists. Its claim to be a "calendar" is undoubted, as the work to be done is arranged under the heading of each month.

**THE GARDENERS' CHRONICLE, Ltd., 5, Tavistock Street, London, W.C. 2**

## WILLIS BROS.' Garden Fertiliser

**THE BEST ON THE MARKET.**  
**NO STABLE MANURE REQUIRED.**  
For digging in or as a top-dressing. For kitchen Gardens or Herbaceous Borders.

1 cwt., 15/-; ½ cwt., 9/-; 28 lb. 5/-; £14 10/- per ton. All Carriage Paid.

### LOOK TO YOUR VINES!

The Vine requires a large quantity of Potash for its proper growth and the development of fruit. WILLIS BROS. VINE MANURE contains 7% Potash, 22% Phosphate, and 4% Nitrogen, and the results justify us in saying it is the best on the market. The effect on old vines is very marked, it puts new life into them. 1 cwt., 25/-; 56 lb. 14/-; 28 lb. 8/- All Carriage Paid

### LAWN MANURE.

Having been connected with the experimental manuring of pastures, etc., for over 40 years, we are in the position to offer the above with perfect confidence as to results. It is especially suitable for poor mossy lawns, improving the texture of the grass, and helping the lawns to keep their colour in dry seasons. Can be used at the rate of 5 cwt. to the acre. 1 cwt., 20/-; 10 cwt., £9 15/-; 1 ton., £19. Carriage Paid. Special Prices quoted for Grass Manures for Park Land in quantities.

### LAWN SAND AND DAISY KILLER.

This preparation will be found very effective for thickening the sward and encouraging the grasses; also destroys the daisies and other weeds so troublesome on lawns. 1 cwt., 25/-; 10 cwt., £12. Carriage Paid. DIRECTIONS FOR USE.—Sprinkle thinly over the surface of the lawns at the rate of 4 to 6 ozs. to the square yard; where a mass of weeds occurs a little more may be used, as the grass cannot get through until the weeds are killed. A dry day in autumn or spring is the best time to apply the LAWN SAND.

### SUSSEX TRUG BASKETS.

18" 4/-; 20" 5/-; 23" 6/-; 26" 7/-; 28" 8/-; each. Carriage Paid.

### GARDEN SUPPLIES AT LOWEST PRICES.

## The Ascent of Sap.

It is a good thing for men of science to have in their keeping not only imposing bodies of knowledge, but one or two technical mysteries. Of such salutary antidotes to scientific cocksureness the botanist possesses at least one first-rate mystery—that of the mechanism employed by trees in forcing up from the root to the crown a constant and considerable stream of sap. There have, of course, been many suggestions designed to elucidate the mechanism of the ascent of sap, but none of them is altogether convincing. In such cases the golden rule is "when in doubt try vitalism"—that is, when physical explanations fail, fall back on the mysterious powers of vital force. Thus, in the case of the ascent of sap, it used to be supposed that the living cells associated with the dead conducting vessels of root and stem acted as a series of relay pumps, each of which forced water a little way upward. Unfortunately, however, for this pretty hypothesis, the facts appear to be against it. Recent studies\* of this problem—carried out in the Laboratory for Plant

Physiology, Tucson, Arizona, indicate that the living cells associated with the wood play no part whatever in the process, if, indeed, they do not actually tend to impede it. It appears that in certain trees—Willows, for instance—the region of conduction lies in the late summer-wood of some ten to twelve annual rings. Now the wood vessels of this late summer-wood are not in contact with cellular elements. Those that are—for instance, the vessels of the spring-wood—soon become blocked by the ingrowth into them of cellular tissue and, thus blocked, cease to conduct water. A similar state of affairs has been observed also in the Walnut, though in that case it is the late summer-wood of only the three youngest annual rings that conduct water; the rest of the wood is put out of action as an aqueduct either by the blocking of the vessels by ingrowing cellular tissue or by the conversion of the wood into heart-wood. There are yet more powerful reasons for denying the cellular tissue of the woody stem any rôle in water-conduction. Many years ago, Strasburger demonstrated that water-conduction continues for many days after a certain length of a woody stem has been killed; the root below still goes on absorbing water, and the leaves above still receiving it remain fresh and green. This classical experiment has recently been repeated by Professor Overton (*loc. cit.*). A Willow about twenty-five feet high was sacrificed to experimental piety. Sawn off, its cut end was lowered into strong picric acid, and the trunk stood in the poison for four days. It was then removed and placed in a dye (acid fuchsin) the course of which could be traced subsequently by sawing up the wood. After four days in the dye it was found that—like the cat that kept on walking—the Willow, enjoying as many lives, had kept on transpiring. The dye which was offered to the trunk killed by the poison passed up the dead trunk to a height of over twelve feet, and followed just the same course as water does in the normal, uninjured stem. We are, therefore, left with no other interpretation than that put forward many years ago by Professor Dixon, of Trinity College, Dublin: that in the vessels of a tree there are many continuous columns of water, starting from the leaves to the finest ramifications of the root; and that as water is lost by the leaves, these columns, like watery ropes, are hauled up bodily and unbrokenly. Like many modern efforts of art, this is a picture by no means easy to grasp; but there it is; we may regard it as a true presentment of the ascent of sap, or we may, whilst not denying its verisimilitude, still cherish the problem as a mystery pleasant to contemplate and, as a mystery must, lying just outside the range of our comprehension. One of the great cosmic facts is this, on every sunny day the vegetation of this globe withdraws from the earth millions of tons of water, carries it upward toward heaven on a journey ranging from one inch or two to a hundred yards or more, and discharges that burden as invisible vapour into the atmosphere, day in, day out, so long as the life of plants endures.

**Kew Gardens.**—The *Bulletin of Miscellaneous Information* (Appendix 1, 1927), published by the Royal Botanic Gardens, Kew, contains a review of the work of the Gardens during 1926. Particulars are given of Dr. Hill's visit to America as a delegate to the International Congress of Plant Sciences, held at Ithaca, New York State, U.S.A. His itinerary was very similar to that of Mr. Chittenden, of which an account is given on page 218. With regard to the Gardens, it is stated that the number

of visitors in 1926 was 1,162,547, which is over half-a-million decrease on the figures of the preceding year. The re-imposition of a charge of 1d. for admission on the 1st January, 1926, apparently did not account wholly for the decreased attendance, as the number of visitors who attended during the first four months of that year exceeded by over 21,000 that in the corresponding period for 1925. The decline was greatest in May and June, when travelling facilities were restricted owing to the industrial troubles. The figures for June, 1925, and June, 1926, are 332,458 and 144,174 respectively. The unusually inclement weather in May, also adversely affected the attendance. The new Rhododendron House has been planted; the greater number of the plants used have been raised and grown at Kew, but several valuable species have been contributed, notably by Mr. J. C. Williams and Mr. Lionel de Rothschild. The soil with which the beds have been filled has been taken from the Queen's Cottage Grounds, at Kew, as the *Bulletin* states it is a much better medium for cultivating Rhododendrons under glass than a peaty soil, which is very apt to turn close and sour in a few years' time. The natural soil at Kew is free from lime and keeps sweet for a much longer time than peat. In order to screen the unsightly view of the docks and railway across the Thames at Brentford, a number of Elms and other trees have been felled and large evergreens planted in their places. Owing to the extension of the Great Western Railway's works right up to the Sion House property, it has been decided to carry the screen of evergreens still further. It is stated that the most interesting plant that flowered at Kew during 1926 was *Amorphophallus Titanum*. His Majesty The King presented the Gardens with several fine Palms from Frogmore, and these have been planted in the Temperate House and the Palm House. Another notable gift is that of 850 bulbs of *Hippeastrums*, the collection of the late Mr. J. A. Kenrick. In view of the disability of cultivating certain trees and shrubs successfully on the low, flat levels of the Garden, owing to early growth, due to unseasonable warmth, being ruined by frost later, a trial of certain trees and shrubs is being conducted in Richmond Park, where, through the courtesy of His Majesty's Office of Works, the Kew authorities have been permitted to use a plot of ground on one of the higher elevations. Meteorological instruments have been installed in the Park near the plantation, and it is hoped that the records from these instruments will provide an interesting comparison with those of the meteorological records at Kew and those of Kew Observatory. So far, it is shown that the daily maxima in the Park are, in general, slightly lower than at Kew, while the minima tend to be slightly higher. The retirement of Mr. J. Masters Hillier, after forty-seven years' service in the Museums, is referred to in the *Bulletin*, and the appointment of Mr. W. Dallimore to the office of Keeper. No fewer than 87,400 specimens were mounted in the Herbarium during 1926, and 47,792 specimens incorporated in the Herbarium. The total number of specimens received during 1926 was about 23,132, of which 4,548 were purchased.

**The late Sir George Holford.**—The estate of the late Sir George Holford includes unsettled property to the gross value of £510,269, with net personality, £432,664. He left £10,000 upon trust for his agent, David Lindsay, for life, with remainder to Mr. Lindsay's two daughters, and he left an annuity of £50 to his gardener, Mr. W. T. Mitchell.

**Singapore Botanic Gardens.**—Guide books serve a useful purpose, although few of them are really entertaining. In his *Guide to the Singapore Botanic Gardens*, however, Mr. I. H. Burkill has provided entertaining reading and abundant interesting and beautiful illustrations of scenes and the finer specimens of plants in the gardens of which he was the Director. He has something to say of special interest about every one of the many hundreds of plants he mentions, and has arranged the text in such a way that a visitor may, by the further assistance of the large

# SUTTON'S GRASS SEEDS

One of the Germination Houses at Sutton's Seed Testing Station, Reading.

## THICK EVEN SWARD

To secure a good close turf—fit for play within a few months of sowing—you must be sure of seed not only of guaranteed germination, but with the highest possible energy of growth. The accompanying illustration shows a corner of the Germination Tests in our Seed Testing Laboratory (one of the first private stations to be licensed by the Government) where Sutton's Seeds pass their first severe test.

*Write to our Advisory Department for advice on any problems connected with the formation and upkeep of turf.*

## The Ascent of Sap.

It is a good thing for men of science to have in their keeping not only imposing bodies of knowledge, but one or two technical mysteries. Of such salutary antidotes to scientific cocksureness the botanist possesses at least one first-rate mystery—that of the mechanism employed by trees in forcing up from the root to the crown a constant and considerable stream of sap. There have, of course, been many suggestions designed to elucidate the mechanism of the ascent of sap, but none of them is altogether convincing. In such cases the golden rule is "when in doubt try vitalism"—that is, when physical explanations fail, fall back on the mysterious powers of vital force. Thus, in the case of the ascent of sap, it used to be supposed that the living cells associated with the dead conducting vessels of root and stem acted as a series of relay pumps, each of which forced water a little way upward. Unfortunately, however, for this pretty hypothesis, the facts appear to be against it. Recent studies\* of this problem—carried out in the Laboratory for Plant

Physiology, Tucson, Arizona, indicate that the living cells associated with the wood play no part whatever in the process, if, indeed, they do not actually tend to impede it. It appears that in certain trees—Willows, for instance—the region of conduction lies in the late summer-wood of some ten to twelve annual rings. Now the wood vessels of this late summer-wood are not in contact with cellular elements. Those that are—for instance, the vessels of the spring-wood—soon become blocked by the ingrowth into them of cellular tissue and, thus blocked, cease to conduct water. A similar state of affairs has been observed also in the Walnut, though in that case it is the late summer-wood of only the three youngest annual rings that conduct water; the rest of the wood is put out of action as an aqueduct either by the blocking of the vessels by ingrowing cellular tissue or by the conversion of the wood into heart-wood. There are yet more powerful reasons for denying the cellular tissue of the woody stem any rôle in water-conduction. Many years ago, Strasburger demonstrated that water-conduction continues for many days after a certain length of a woody stem has been killed; the root below still goes on absorbing water, and the leaves above still receiving it remain fresh and green. This classical experiment has recently been repeated by Professor Overton (*loc. cit.*). A Willow about twenty-five feet high was sacrificed to experimental piety. Sawn off, its cut end was lowered into strong picric acid, and the trunk stood in the poison for four days. It was then removed and placed in a dye (acid fuchsin) the course of which could be traced subsequently by sawing up the wood. After four days in the dye it was found that—like the cat that kept on walking—the Willow, enjoying as many lives, had kept on transpiring. The dye which was offered to the trunk killed by the poison passed up the dead trunk to a height of over twelve feet, and followed just the same course as water does in the normal, uninjured stem. We are, therefore, left with no other interpretation than that put forward many years ago by Professor Dixon, of Trinity College, Dublin: that in the vessels of a tree there are many continuous columns of water, starting from the leaves to the finest ramifications of the root; and that as water is lost by the leaves, these columns, like watery ropes, are hauled up bodily and unbrokenly. Like many modern efforts of art, this is a picture by no means easy to grasp; but there it is; we may regard it as a true presentment of the ascent of sap, or we may, whilst not denying its verisimilitude, still cherish the problem as a mystery pleasant to contemplate and, as a mystery must, lying just outside the range of our comprehension. One of the great cosmic facts is this, on every sunny day the vegetation of this globe withdraws from the earth millions of tons of water, carries it upward toward heaven on a journey ranging from one inch or two to a hundred yards or more, and discharges that burden as invisible vapour into the atmosphere, day in, day out, so long as the life of plants endures.

**Kew Gardens.**—The *Bulletin of Miscellaneous Information* (Appendix 1, 1927), published by the Royal Botanic Gardens, Kew, contains a review of the work of the Gardens during 1926. Particulars are given of Dr. Hill's visit to America as a delegate to the International Congress of Plant Sciences, held at Ithaca, New York State, U.S.A. His itinerary was very similar to that of Mr. Chittenden, of which an account is given on page 218. With regard to the Gardens, it is stated that the number

of visitors in 1926 was 1,162,547, which is over half-a-million decrease on the figures of the preceding year. The re-imposition of a charge of 1d. for admission on the 1st January, 1926, apparently did not account wholly for the decreased attendance, as the number of visitors who attended during the first four months of that year exceeded by over 21,000 that in the corresponding period for 1925. The decline was greatest in May and June, when travelling facilities were restricted owing to the industrial troubles. The figures for June, 1925, and June, 1926, are 332,458 and 144,174 respectively. The unusually inclement weather in May, also adversely affected the attendance. The new Rhododendron House has been planted; the greater number of the plants used have been raised and grown at Kew, but several valuable species have been contributed, notably by Mr. J. C. Williams and Mr. Lionel de Rothschild. The soil with which the beds have been filled has been taken from the Queen's Cottage Grounds, at Kew, as the *Bulletin* states it is a much better medium for cultivating Rhododendrons under glass than a peaty soil, which is very apt to turn close and sour in a few years' time. The natural soil at Kew is free from lime and keeps sweet for a much longer time than peat. In order to screen the unsightly view of the docks and railway across the Thames at Brentford, a number of Elms and other trees have been felled and large evergreens planted in their places. Owing to the extension of the Great Western Railway's works right up to the Sion House property, it has been decided to carry the screen of evergreens still further. It is stated that the most interesting plant that flowered at Kew during 1926 was *Amorphophallus Titanum*. His Majesty The King presented the Gardens with several fine Palms from Frogmore, and these have been planted in the Temperate House and the Palm House. Another notable gift is that of 850 bulbs of *Hippeastrums*, the collection of the late Mr. J. A. Kenrick. In view of the disability of cultivating certain trees and shrubs successfully on the low, flat levels of the Garden, owing to early growth, due to unseasonable warmth, being ruined by frost later, a trial of certain trees and shrubs is being conducted in Richmond Park, where, through the courtesy of His Majesty's Office of Works, the Kew authorities have been permitted to use a plot of ground on one of the higher elevations. Meteorological instruments have been installed in the Park near the plantation, and it is hoped that the records from these instruments will provide an interesting comparison with those of the meteorological records at Kew and those of Kew Observatory. So far, it is shown that the daily maxima in the Park are, in general, slightly lower than at Kew, while the minima tend to be slightly higher. The retirement of Mr. J. Masters Hillier, after forty-seven years' service in the Museums, is referred to in the *Bulletin*, and the appointment of Mr. W. Dallimore to the office of Keeper. No fewer than 87,400 specimens were mounted in the Herbarium during 1926, and 47,792 specimens incorporated in the Herbarium. The total number of specimens received during 1926 was about 23,132, of which 4,548 were purchased.

**The late Sir George Holford.**—The estate of the late Sir George Holford includes unsettled property to the gross value of £510,269, with net personalty, £432,664. He left £10,000 upon trust for his agent, David Lindsay, for life, with remainder to Mr. Lindsay's two daughters, and he left an annuity of £50 to his gardener, Mr. W. T. Mitchell.

**Singapore Botanic Gardens.**—Guide books serve a useful purpose, although few of them are really entertaining. In his *Guide to the Singapore Botanic Gardens*, however, Mr. I. H. Burkill has provided entertaining reading and abundant interesting and beautiful illustrations of scenes and the finer specimens of plants in the gardens of which he was the Director. He has something to say of special interest about every one of the many hundreds of plants he mentions, and has arranged the text in such a way that a visitor may, by the further assistance of the large

\* Annual Report of the Director of the Laboratory for Plant Physiology, Carnegie Institution of Washington. Year Book No. 25, 1925-26.

garden plan, easily find the plants he wishes to study. Instead of giving a lengthy history of the Gardens, the author has indicated their evolution by means of a graceful dedication of his guide "To Henry Nicholas Ridley, C.M.G., F.R.S., who as Director, from 1888 to 1912, gave to the Botanic Gardens their scientific reputation; and also to the memory of Major-General Sir W. Orfeur Cavenagh, who, during his service as Governor of the Straits Settlements (1859 to 1867) did all that he could unofficially to establish the Gardens; of John Earn Macdonald and Edward John Leveson, merchants, and successively Honorary Secretaries and Treasurers of the Agri-Horticultural Society of Singapore, which found funds for their early growth; of Lawrence Niven, planter, who laid them out for the Society; of James Henry Murton, the first Superintendent under the Government of the Straits Settlements, for his vigorous planting in them; and of Nathaniel Cantley, Superintendent from 1880 to 1888, as having been the originator of much that is good in their internal organisation." This illustrated Guide is a work of art and its index renders it a useful book of reference to tropical trees and shrubs (the authority is given for every name); at one dollar a copy it is amazingly cheap.

**A New Flower Show.**—The Harrogate Agricultural Society has decided to include a horticultural exhibition in its annual show. The flower show is fixed for Friday and Saturday, August 5 and 6, and will be held in a separate field. Harrogate is a town of beautiful gardens and parks, and it is expected that large numbers of entries will be received in the several classes, which are mostly non-competitive. Mr. C. W. H. Allen is Chairman of the Committee, members of which include Lady Evelyn Collins, Ella, Lady Peel, Col. W. F. Collins, Mr. J. G. Besant, and the Rev. J. Bernard Hall.

**Competitive Plans for a German Park.**—The town of Tilsit, in Germany, is to have a new park, and the plans for the laying out of the ground are to be the subject of a competition, open to all German garden architects. There are several prizes, which will total 4,000 marks; and the fortunate competitor whose plans are finally selected will be invited to take part in the actual work of construction.

**Railway Station Gardens.**—The London and North Eastern Railway Company announce a competition for prizes to be given by the Directors for the best-kept stations throughout their system. Many prizes and certificates will be awarded, and an inspection will be held in July and August this year. In awarding the prizes, the judges will take into consideration the situation of the station and space available for flower and shrub displays, apart from the general condition and cleanliness of the station premises.

**Ghent Floraries, 1928.**—The very business-like Committee of the Ghent Agricultural and Botanical Society which has in hand the arrangements for the Floraries of 1928, has already sent out the Schedule for this Exhibition which contains over 125 pages. It is to be held from the 21st to the 29th of April, 1928; as usual, the King of the Belgians has accorded his patronage, and M. François Spaë is President of the Organising Committee. The exhibits are to be divided into twenty-eight groups, each group being sub-divided; and the importance of the event may be judged from the fact that there are nearly eight hundred divisions! The prize list is too long to be examined in detail, but it may be said that it contains many cups and prizes of very great intrinsic value apart from the satisfaction of winning in circumstances where the general level of merit is of such a high average as it always is at Ghent. M. Emile Draps, the President of the Antwerp Royal Agricultural and Horticultural Society, is offering a special prize in the form of a work of art valued at 1,000 francs, to be awarded to the exhibitor who is considered to have contributed most to the success of the section of Floral Art. The Press Commission is, as usual,

composed of members drawn from various countries; among the English members are Mr. J. S. Brunton, of the *Horticultural Trade Journal*; Mr. Charles H. Curtis, of the *Gardeners' Chronicle*; and Mr. Charles Pearson, of the *Horticultural Advertiser*. The designing of the Exhibition is in the capable hands of M. Henri de Wilde, the Director of the Ghent parks and open spaces. A great interest is being taken in the event by M. le Comte de Kerchove de Denterghem, the Governor of East Flanders, who has consented to act as President of the Conseil de Direction. He is one of the most enthusiastic horticulturists in Belgium, and his sympathetic support in matters appertaining to horticulture can always be counted upon.

**Bill for the Preservation of London Squares.**—A Bill, entitled the London Squares (Preservation) Bill to protect or limit building on garden squares in London, has been presented to Parliament by Mr. John Scurr, M.P. The Bill defines a "garden square" as any enclosed garden or open space (other than a garden or open space vested in or under the control and maintenance of a public or local authority for the use and

MME. PHILIPPE L. DE VILMORIN.

(see p. 214).

enjoyment of the public) which has been set apart or has existed for the use, enjoyment, or benefit of the inhabitants of any square, crescent, circus, street, or other place, and which during the twenty-five years ending on the 31st day of December, 1926, has been (apart from any occupation or user thereof by or on behalf of the Crown or a Government Department in connection with war purposes) maintained, kept, or used as a garden square. The Bill proposes that it shall be unlawful without the sanction of the London County Council (or in the City, of the Lord Mayor, Aldermen, and Commons of the City of London in Common Council assembled) for any person to erect any building or structure in, over, or upon any garden square in the Administrative County of London. Such sanction may be given, subject to such terms and conditions as the Council may think fit to impose, including if thought fit, a condition that in consideration of such sanction the owner of the garden square on which it is desired to build shall: (a) dedicate to the use and enjoyment of the public as an open space such portion of the garden square as shall be agreed upon, or (b) transfer or convey to the Council a specified area of land for use as an open space, or (c) pay to the Council such sum of money as shall be agreed upon to be expended by the Council for the provision or extension of an open space or open spaces.

**Award of the U.S.A. White Medal of Honour.**—The medal awarded annually by the Massachusetts Horticultural Society in memory of George Robert White, has been awarded for 1927 to Dr. Liberty Hyde Bailey, of Ithaca, New York. The award is made to Dr. Bailey for his work in horticulture, and especially as an educator, author and editor. Dr. Bailey was born in South Haven, Michigan, in 1858, and after graduating from the Michigan Agricultural College, he became a professor of horticulture and landscape gardening. Subsequently he was appointed to the chair of Experimental Horticulture at Cornell University, where he became the Dean of the College of Agriculture and Director of the Experiment Station. He retired in 1913, and has been busy since in travelling, lecturing and writing. The George Robert White Medal is the highest horticultural honour in America; it is of gold, and weighs eight-and-a-half ounces. Dr. Bailey's *Standard Cyclopedia of Horticulture* is the most complete work of its kind ever attempted; it is on the lines of Nicholson's *Dictionary of Gardening*, but much more complete than that work, and as a book of reference on horticulture, it is one of the most useful ever published. Dr. Bailey's other numerous works are valuable contributions to horticultural literature.

**Horticultural Exhibition at Alkmaar.**—A series of horticultural exhibitions is being conducted at Alkmaar, Holland, covering practically the whole of the bulb-flowering period. On March 26 and 27 a children's bulb-growing competition will be judged, in which the approximate number of entries may be gathered from the fact that 9,000 bulbs were given out. Probably the greatest interest will centre upon the second period from April 17 to 22, when it is expected that the great flower-growing centre of Aalsmeer will yield the best of the growers' produce; groups of 500 Darwin Tulips and Narcissi will be shown, and valuable money prizes awarded.

**The Royal Gardeners' Orphan Fund.**—It will be remembered that in our report of the recent Annual General Meeting of the subscribers to the above gardening charity, we mentioned that the Chairman, Mr. David Ingamells, brought before the meeting some particulars, just then received, of the orphan children of Mr. G. F. Waller, late gardener at The Syren, Hayling Island, Hampshire. Both Mr. and Mrs. Waller died on the same day. We are glad to learn that all the necessary particulars have been obtained, and that the Committee, acting on a resolution passed at the Annual Meeting, has placed the two children on the full benefits of the fund. Mrs. Saywell, of Havant, a sister of the late Mr. Waller, has kindly undertaken to care for the children. We also learn that the Fund has received from her executors the legacy of £100 left by Mrs. George Monro, J.P., who died in April of last year. As is well-known, the deceased lady and the members of her family have been very generous supporters of this admirable charity.

**Imports of Fruit and Vegetables from Belgium.**—A report has lately been issued in Belgium giving particulars of the weight of horticultural produce exported thence to various European countries in 1926, and it is interesting to observe certain of the figures which concern the produce sent to Great Britain. Although Potatoes are so widely grown in Great Britain, Belgium sent us between four and five million kilograms (a kilogramme being about two-and-a-quarter pounds). Of Cherries we received nearer three million than two million kilos, and as the total weight exported was not much over three million, it is plain that we took the bulk of the Cherries grown. Of Pears we imported from Belgium the enormous total of nearly thirty million kilos, and of Apples, four-and-a-half million; Plums totalled nearly three million, and Grapes well over two million kilos. Of nursery produce the totals are much smaller; we obtained 14,000 kilos of bulbs from Belgium, while Rose trees were imported only to the extent of 7,720 kilos, compared with 114,774 kilos sent to France.

**An Arboretum for Ontario.**—Mr. H. J. Moore, of the Ontario Department of Agriculture, writes from Toronto, under date of February 6: "I am pleased to report that an Arboretum is to be established in the Province of Ontario, at Bowmanville, at what is known as the Boys' Training School. The School is located about forty miles east of Toronto, a city of 600,000 people, and has splendid railway and highway facilities, being close to the Canadian Pacific and Canadian National Railway stations, also to the Toronto-Montreal Provincial Highway. The school at present has seventy boys in attendance. It is intended to accommodate three hundred. The area at the school estate is three hundred acres, most of which is devoted to agriculture, a few acres to fruit culture, and fifty to the forementioned project, with opportunity to extend as necessary. A plot of five acres is to be laid out for flower demonstration or as a small botanic garden. The feature, however, will be the Arboretum. The area is delightfully undulating, and is intersected by a splendid stream. It has soils and positions which are ideal for collections of practically all hardy subjects, having gentle slopes which face all points of the compass. It also has considerable areas of gently rolling land." To this letter we may add that the Training School estate referred to was presented to Ontario by Mr. John H. H. Jury, of Bowmanville, and Mr. Moore has prepared the plans for the Arboretum and gardens.

**Legacy to a Gardener.**—The late Hon. Mrs. Eliot Yorke left a legacy of £100, free of duty, to her gardener, Mr. Caleb Briars.

**Crocuses at Hampton Court.**—Although a week later than the official "Crocus" Sunday at Hampton Court, last Sunday proved to be the popular time for the early spring festival, and the large number of visitors found the spacious breadths of Crocuses in the grassy slope by the canals well worth the journey. In the brilliant sunshine the flowers opened widely and made a gorgeous display. Although it is too early to expect many other flowers, yet, in the long border, in several of the flower beds, and in the so-called Dutch Garden, there were masses of Arabis, Forget-me-Nots, Violas and the first Daffodils, to be admired; while amongst shrubs were bushes of Ribes sanguineum, Cydonia (Pyrus) japonica and Prunus pissardii in full bloom.

**Effects of Nitrogen-Fixing Bacteria on the Growth of Maize.**—The well-known French horticulturist and agricultural chemist, M. Georges Truffaut, of Versailles, has carried out, with the collaboration of M. N. Bezsonoff, a series of interesting experiments on the influence on the growth and development of Maize of nitrogen-fixing bacteria. It was found that by artificially increasing the number of bacteria and thus enhancing the amount of nitrogen supplied to the roots of the plants, the growth underwent a marked improvement. The details of the experiments and of the exact material and apparatus used have been published in a little pamphlet, itself a reprint of the report of the session of the 29th November, 1926, of the Académie des Sciences in Paris.

**Brussels International Exhibition.**—An international Horticultural Exhibition is to be held in Brussels, in the large Jubilee Palace Hall and the gardens attached, from the 10th to the 18th of September, this year. The King and Queen of the Belgians are according their patronage, and the exhibition will also enjoy the co-operation and support of the Belgian Government, the municipal authorities of Brussels, and the Belgian provincial governors. The arrangements are being made by the Royal Horticultural and Agricultural Society of Brussels, but many other Societies are giving their whole-hearted assistance to make the event a successful and impressive one. The area devoted to exhibits of plants and horticultural products in general will measure 17,000 square metres, and ample space will be devoted to colonial exhibits. It is anticipated that hundreds of thousands of visitors will attend the Exhibition, and an overwhelming response is anticipated to the invitations now being

issued to exhibitors to take space for their specialities. Full particulars, and programmes in due course, may be obtained on application to M. Eugene Draps, Uccle, Brussels.

**Appointments for the Ensuing Week.**—**MONDAY, MARCH 28:** Harrogate and District Horticultural Association's meeting. **TUESDAY, MARCH 29:** British Carnation Society's show at the Royal Horticultural Hall (two days). **WEDNESDAY, MARCH 30:** Tamar Valley Commercial Horticultural Society (two days); Instow Spring Flower Show. **THURSDAY, MARCH 31:** Paisley Florists' Society's meeting. **FRIDAY, APRIL 1:** Accrington and District Chrysanthemum Society's meeting. **SATURDAY, APRIL 2:** Paisley Florists' Society's show; Blackburn and District Horticultural Society's meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Sikkim Rhododendrons.*—From a remark in your able Leader of last week, it appears that the fact of most of the Sikkim Rhododendrons having, though unprotected, thriven in the open air throughout last winter is not generally known. Small plants of all the species were planted out, late in autumn,

to have suffered less from shrivelling of the ends of the leaves than those in the conservatory have. The trying season has, however, but now commenced, and I have little expectation of many of them surviving the spring, without much shade and moisture. The soil at Kew, even in these made beds, is light and dry; the roots of the young plants do not strike deep, and I felt the leaves of several to be quite warm under the sun of last Monday, clearly indicating a checked circulation. In their native localities, at this early state of growth, young plants have a very wet, cool subsoil in the spring months, so that though the sun's rays be more powerful than in England, they are provided, by an abundance of humidity at the roots, against any injury than would arise from a suddenly increased circulation. Most of these species again, being natives of 8-12,000 feet, experience a very much colder winter than that of England is; they are consequently kept in too excited a state here, and the spring frosts of April are all the more to be dreaded. In the Himalaya the first great increase of temperature occurs in March, which is 8° warmer than February; this brings forward the Himalayan plants, which are not exposed afterwards to night

FIG. 100.—SNOWDROPS AT WICK HOUSE, BRISLINGTON, BRISTOL.

(see p. 210).

among the Rhododendron clumps on either hand of the main walk at Kew. Not one of these has been killed; all, with few exceptions, are at this moment healthy, and many have flourished. There are the following: *R. argenteum*, from 6-7,000 feet, and *R. Campbelliae* from 8-10,000 feet, both very strong and luxuriant; *R. barbatum* (8,000 feet), and *R. campanulatum* (11,000 feet), several plants of each strong and healthy; *R. ciliatum* (10,000 feet), several specimens in the same state, two or three have well-formed flower-buds and will probably blossom in a week or two; *R. lepidotum* (12-14,000 feet), a little of, much stronger and healthier than the plants in the greenhouse; *R. argenteum* (8,000 feet), a few robust specimens; *R. glaucum* (11,000 feet), many particularly healthy young plants; *R. campylocarpum*, *cinnabarinum*, and *Thomsonii* (all from 10-12,000 feet), several plants (a dozen or so) of each, and all strong and healthy; *R. Dalhousiae* (7,000 feet), a few plants, not vigorous or promising; *R. Falconeri* (10,000 feet), *Aucklandii* (6-7,000 feet), and *lanatum* (10,000 feet), one or two fair specimens of each. The above have had no protection, but such as the surrounding low Rhododendron bushes have afforded; and upon the whole they appear

frosts. In England, an equivalent increment of temperature does not occur till May; but our winters are so mild, that the cultivated Himalayan plants are as forward in April in England as they are in their native country, and consequently suffer extremely from our night frosts. In the conservatory three plants of *R. ciliatum* remain in flower; these flowers are very much larger than I ever saw them in the Himalaya (several blossoms are three inches diameter!), but nearly white, probably from the difference between the amount and intensity of solar light at 10,000 feet in May, of lat. 27°, and at the level of the sea in March of lat. 52°. I have been just shown a magnificent head of *R. arboreum* in flower, from Mr. Barclay, of Bury Hill, who informs me that the plant is a dwarf low shrub raised from Kemaon seeds and grown without any protection. *J. D. Hooker, Gard. Chron., March 27, 1852.*

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Calanthe.**—The different species and hybrids of the *vestita* section of *Calanthe* will need re-potting when the new growths are a few inches high and are about to develop fresh roots. In removing the pseudo-bulbs from the pots the exhausted soil should be shaken out and the old roots cut off, leaving them about an inch long, to hold the plant firmly in the new material. Whilst out of their pots, the plants should be thoroughly cleansed, as they are subject to attacks of scale insects, which, if allowed to spread, do irreparable harm. In doing this care must be taken not to injure the young growths and roots. If it is desired to increase the stock of any particular variety, remove the back pseudo-bulbs, which may be placed in a pan on damp moss; many will form new growths, and they may then be potted in the same manner as the previous year's pseudo-bulbs, with the new growth in front. *Calanthes* enjoy a richer and more retentive compost than most Orchids, but water must pass freely through it, therefore ample drainage material should be used.

**Repotting.**—A suitable compost for *Calanthes* consists of three parts good fibrous loam, broken up roughly, and one part *Osmunda*-fibre cut into moderately fine portions and with all the earthy particles removed; a quantity of dried cow manure crushed small, some bone-meal, and sufficient coarse silver sand to render the compost porous. These materials should be mixed some little time before they are required for use, and warmed through. The pseudo-bulbs may be potted either singly, or two or three in a pot; it is usual to place them singly in five-inch pots, but if house room is limited, three or four pseudo-bulbs may be placed in a six-inch pot. Press the compost with moderate firmness around the base of each pseudo-bulb, and keep the soil about an inch below the rim of the receptacle to allow room for applying a top dressing of rich material when the new pseudo-bulb is forming. Supply water sparingly until the new growths have rooted freely. So soon as growth becomes fairly active give the plants frequent and liberal waterings at the roots. These Orchids should be grown in plenty of heat and atmospheric moisture, but not exposed to too much bright sunshine, as their foliage is easily scorched, especially when the plants become dry. *Calanthes* may be grown in an ordinary plant stove or even in a Cucumber or Melon house. The late-flowering varieties of *C. vestita*, such as *C. v. Regneri* and its varieties, which are at the present time in flower, may be treated precisely in the same manner as *C. bella*, *C. Veitchii*, *C. Harrisii*, *C. Sedenii*, and the different varieties of *C. vestita* which are now past their flowering season, and to which these remarks apply.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERBEE, Horsley Hall, Gresford, N. Wales.

**Vegetable Marrows.**—A few seeds of a small-growing variety may be sown now in heat. The seedlings should be kept growing actively either in a house or on a hot-bed in a frame; they will prove useful for furnishing an early supply of Marrows. The plants should be grown in good loam, to which a small amount of old Mushroom-bed manure should be added. Ventilate the house or frame whenever the weather is favourable, and do not coddle the plants or mildew will appear. Should this disease be detected, dust the affected parts with flowers of sulphur.

**Dwarf Beans.**—If heated frames are available more of these Beans may be sown for a succession to those growing in pots in the houses. Do not

crowd the plants, or the crop will be poor, and the pods small. When the plants are growing rapidly advantage should be taken of warm days to use the syringe freely. Close the frame early to conserve as much solar warmth as possible. Feed the roots with liquid manure as advised for those growing in pots.

**Broad Beans.**—Plants growing in pots should be planted out on well prepared ground. Draw a little soil near to the stems, which will give the plants slight protection and support. Should the position be very exposed, place evergreen branches alongside the rows to ward off cold winds. More seeds should be sown for succession until about the middle of April. Green-seeded varieties are generally most appreciated and are best for sowing now.

**Celery and Celeric.**—The present date will be found suitable for sowing seeds for the main batches of these useful vegetables. Sow the seeds thinly and take great care that the plants do not experience a check at any time. So soon as the earliest-sown seedlings are ready, they should be pricked out into boxes or frames

FIG. 101.—THE LIME TREES OF BOURNOL  
WOOD IMMEDIATELY AFTER THE WAR.

(see p. 211).

in good soil, consisting of three parts loam, one part old manure, one part leaf-mould, mixed with a little burnt refuse and a sprinkling of soot. Allow the seedlings plenty of space so that they may grow sturdily. Keep the young plants dusted with old soot and maintain a close watch for pests. Green fly is often troublesome, and when it appears the young plants should be sprayed with *Quassia* extract about every week or ten days. The specific will make the leaves distasteful to the aphides and also keep the Celery-leaf mining maggot in check. Sow again in about a month's time for the latest supply.

### PLANTS UNDER GLASS.

By T. PATRMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brockett Hall, Hertfordshire.

**Gesnera.**—The *Gesnera* is a useful plant for the decoration of the stove house, and if started into growth sufficiently early, it may be used when in flower for conservatory decoration. *Gesneras* thrive in a light, rich compost, which may consist of loam mixed with fibrous peat and dried cow manure that has been passed through a sieve, with a liberal quantity of sand and broken charcoal to render the compost open and porous. These plants require a stove temperature during their growing season.

The number of roots required for each pot will depend on the size of the specimen best suited to the growers' requirements; they may be grown singly in forty-eight-sized pots, or several may be placed in an 8-inch pot. If placed direct in the larger-sized receptacle, very careful watering is necessary or the compost will become sour before the roots have entered it freely, but when well-established they enjoy an abundance of clear water alternated with liberal supplies of liquid manure, and they need plenty of atmospheric moisture. So soon as the plants show signs of active growth they should be grown near the roof-glass. It is not wise to syringe the downy leaves or the foliage will become discoloured.

**Stock Plants.**—During the next two months cuttings of various subjects should be inserted, among them *Eranthemums*, *Peristrophe*, *Salvias*, *Plumbago rosea*, *Eupatoriums*, *Bouvardias* and *Clerodendrons*. I strongly emphasise the importance of obtaining the best cuttings. It often happens, especially where growing space is limited, that after these plants have finished flowering they are placed in some odd corner or stood under the stages, where there is insufficient light for them. This naturally results in weak, spindly growths, which are not suitable for affording the best cuttings. Stock plants should be encouraged now to make strong, healthy shoots suitable for propagating purposes.

**Azalea indica.**—As these plants pass out of flower all the old flowers should be removed and, if possible, they should be stood in a warm house and kept well syringed to induce them to break into new, healthy growth.

**The Conservatory.**—At this season of the year an abundance of material is available for the embellishment of the conservatory. With the lengthening days the sun is gaining more power, and to prevent the bleaching of the colours of the flowers the plants should be shaded from bright sunshine. Continue to feed *Arum Lilies*, *Cinerarias*, *Primulas*, etc.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Frame Melons.**—Where this method of growing Melons is adopted, the present is a good time to commence preparing the materials and building up a substantial bed of stable litter and leaves. Make the bed solid, and when the heat of fermentation declines to 80°, introduce a small quantity of suitable compost and sow a few seeds in three-inch pots. Admit a little air at the back of the frame to allow the rank gases to escape. Cover the frame with mats at night, and if the temperature of the frame is not near 70° in the morning, add fresh fermenting material as external linings.

**Spring Cucumbers.**—The earliest sown plants are making rapid progress. A very important detail in the management of spring-sown Cucumbers is getting the plants into their fruiting quarters before they become root-bound. This may be attained by commencing operations for planting in the Cucumber house when the seeds are sown, to ensure that the heaps of soil will be warmed through. As each plant ascends the trellis, pinch the laterals at the first joint, and the point of the plant two feet from the top of the trellis. By this check extra sap will be diverted to the side-growth, but unless the demands are pressing, only allow one or two fruits to mature on each plant until it is well established. Whilst aiming at full crops of fruits, never allow the plants to carry more than they can mature; train the shoots thinly and pinch the fertile laterals at the first joint beyond the fruit to prevent unnecessary crowding. When the plants reach this stage a mild bottom-heat from fermenting materials is an important factor; they will then respond to a temperature of 66° to 70° at night, and 75° to 80° by day, with 5° to 10° higher after closing the house, with sun warmth and atmospheric moisture. Retain a few male flowers for fertilising purposes. For the present, damp the walls and other bare surfaces with warm water

in the morning, reserving direct syringing with warm soft water, or clear soot water, for the time when closing the house in the afternoons.

**Pot Vines.**—Vines growing in pots should not be allowed to suffer for want of water as the berries approach the ripening stage, or even when the Grapes are ripe. If the vines are heavily-cropped and it is doubtful whether the berries will finish to perfection, a little extra air, and a gradual lowering of the night temperature, supplemented by liberal feeding with clear liquid manure and soot water warmed to 85° will help to bring about the desired result. The walls and floors should be damped regularly on fine days, and fire-heat must be equal to the maintenance of a free circulation of warm air throughout the colouring stage. As the weather gets warmer and the Grapes become fit for use, both the day and night temperatures should be lower, and clear water only should be used at that stage.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

**Grafting.**—When the sap is well on the move and the bark parts freely from the wood of the trees to be grafted, the scions may be inserted. Grafting offers a ready means of propagating new varieties quickly, also of working good sorts on to trees of worthless varieties. Healthy stocks should be selected for grafting, and the best and most useful varieties chosen as scions. If the trees have not been headed back do not be too severe in this respect; better and more profitable trees may be obtained in less space of time, if the stumps on which it is intended to insert the scions are left two or three feet in length. In dealing with large branches, crown grafting is the simplest method and the one usually adopted. Two or three scions may be inserted on some of the cut back stems, but on the smaller ones fewer will suffice. Take care that the scions are fresh and plump and of a medium strength. Cut a slit three inches long in the stock; take a scion about six inches long, with good buds at the top, make an oblique cut at the bottom about the same length as the cut in the stock, then raise the bark and insert the graft between the bark and the wood. When the scions are inserted bind the two together with broad raffia, and cover the seat of the union with prepared clay or grafting wax.

**Whip Grafting.**—This system of grafting is mostly adopted in nurseries where there is a large call for young trees, and is not so much practised in private gardens as crown grafting. Young, healthy stocks should be cut down to the height required and the grafts prepared, fitted on to the stock, bound with some soft material and covered with grafting wax.

**Nuts.**—Nut bushes have developed plenty of catkins and promise well for a good crop. In some gardens where there are only a few bushes the pruning of them may have been deferred until the flowering period is over. This work should now receive attention. The main point to be observed when pruning is to keep the cordon-like branches well-clothed with sprays of fruiting wood, and to remove all soft growths and suckers.

### THE FLOWER GARDEN.

By JOHN COURTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Dahlias.**—Where the old tubers have been introduced to a warm house for propagating purposes, plenty of cuttings should now be available; the latter should be secured when they are three to four inches in length for bedding purposes. Old tubers give the best results for this purpose, as they commence to flower earlier, and do not grow so grossly as young plants. Where there is sufficient stock of old roots for the purpose they should be divided and placed in suitable-sized pots. To facilitate this, the tubers may be partly cut back. When

dividing them care must be taken to see that there are dormant buds on the crown of each piece. When the plants are potted they should be stood in cold frames, and afterwards hardened gradually. Many good varieties prove very troublesome to keep from year to year as they either fail to make tubers, or what growth they do make is so small that it is difficult to keep them over the winter. The only way to get over this difficulty is to grow a stock of pot tubers sufficient for the purpose.

**Ivy.**—The trimming of Ivy is often neglected for several years, which is a mistake, as it gets out of hand and becomes filled with dead leaves and rubbish. If trimmed at this date, all the rubbish will be got rid of, and fresh leaves will soon form.

**Calceolarias.**—Calceolarias growing in cold frames and intended for summer bedding, should be lifted and placed in suitable-sized pots.

**Sowing New Lawns.**—It is important to sow grass seed as early as possible in order that the young plants may be well established before dry

foliage plants. It is also very effective associated with bold groups of the stronger-growing, late-flowering varieties of Kniphofias. The clumps may be divided and replanted at this date; those that are not divided should be closely trimmed over.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Strawberries.**—Where Strawberry plantations were not made in September, and additional quantities are necessary, they should be formed at an early date. Strawberries should not be allowed to flower the first season. The soil between the rows should be kept well cultivated, and the plants encouraged to grow freely, removing all unnecessary runners, so that they will produce a full crop of fruits in their second season.

**Melons and Cucumbers.**—The main batch of both these crops should now be sown, as sun-heat should be available to keep the houses sufficiently warm, with the help of a little fire-heat during the night. The night temperature should be maintained at a minimum of 65°, rising in the daytime to 80°, and the plants kept growing without a check. Copious damping and syringing frequently among the plants is the most effective way of keeping insect pests in check. The beds intended for the reception of the plants may now be formed, using good, turfy loam, with the addition of wood-ash and bone-meal for the Melon bed, and in that for Cucumbers a proportion of well-decayed manure. Allow plenty of room for frequent top-dressings later, as the plants require more soil. The Melon bed should be trodden or rammed firmly to encourage short-jointed growths, and a layer of fermenting materials placed underneath; it will prove of great value in conserving moisture. Two seeds of either Melons or Cucumbers should be sown in a three-inch pot, and when it becomes evident which is the stronger plant, the weaker one should be removed.

**Violets in Frames.**—These plants have nearly passed their useful stage, and as others in beds and borders out-of-doors are providing plenty of flowers they may be cleared from the frames which will be useful for a variety of bedding plants now demanding more room. Plantations of Violets should be made on a partially-shaded border, where the soil is in good condition, and liberal supplies of soot should be forked into the ground as it is being made ready. The old plants should be divided carefully, retaining only the best portions. Incorporate a quantity of old, sandy potting soil in the ground so that the roots may develop freely at once. Should the weather prove dry, water the plants liberally once or twice, after the sun has passed for the day. The further cultivation of the plants consists in keeping the soil stirred occasionally and the removal of all runners or side-shoots that are not required.

**Onions.**—Autumn-sown Onions have wintered very well, and they should be transplanted to their summer quarters. As these Onions are greatly valued for early supplies, they should be planted more closely than is usually recommended, so that every alternate plant may be taken out first, thus leaving the remaining crop plenty of room to mature.

**Broccoli.**—The winter and early spring varieties are over, and the ground occupied by the plants should be cleared of the stumps and manured according to the crop it is intended for; if for Potatoes or another root crop it will not be necessary to add farmyard manure, but a compound of superphosphate of lime, potash and sulphate of ammonia. Later Broccoli are looking extremely well, having passed through the winter here with scarcely a leaf browned; these should be looked over at frequent intervals whenever frost threatens, and the curds covered. Purple-sprouting Broccoli is a most useful crop during the spring, when fresh vegetables are scarce.

FIG. 102.—ONE OF THE BOURLON WOOD LIME TREES, SHOWING SUCCESSFUL TREATMENT OF WOUNDS CAUSED BY SHELL FIRE.

(See p. 211).

weather sets in. After carefully preparing the ground by rolling and raking to obtain a fine surface tilth, scatter the seeds on a calm, dry day. In making new lawns from seed it is a great advantage if the ground is prepared during the autumn; this allows plenty of time for the soil to become settled, and seeds of weeds will have germinated and can be removed before sowing the grass seed in the spring. Reliable seed houses will supply suitable mixtures for any particular soil or purpose; it is always wise to state whether Rye grass should be included or not, and care should be taken not to include Clover for playing lawns.

**Mowing.**—Lawns should be rolled and swept before mowing is started, for it is very unwise to spoil new or newly-sharpened machines at the beginning of the season. The care of mowing machines is very important, and they should always be in charge of a competent workman; this especially applies to motor-mowers, which, in the hands of an incompetent workman may prove very expensive in upkeep.

**Pampas Grass.**—There are several varieties of the Pampas Grass, which is very effective as a lawn specimen or for grouping with other

## FLORISTS' FLOWERS.

### PANSIES AND VIOLAS.

WHERE a large display of flowers is required in the spring and early summer, there are few plants to equal the Pansy and Viola. They have a use in gardens the extent of which has not even yet been fully realised, especially amongst amateur gardeners. Those who have a cool, moist, half-shaded border may have these flowers in full beauty the whole season through, but on warmer and drier soils their season of flowering is more limited. Neither the Pansy nor the Viola is grown so extensively in large, private gardens as it was twenty or thirty years ago, but both are planted largely in public parks and small gardens. These flowers do not grow to such perfection in the south of England as they do in Scotland and the northern counties of England, but in cool, moist situations they give a good return for their outlay.

I do not propose to deal with the show Pansies beyond stating that to have the individual blooms in perfection, the plants must be highly fed.

Seedling Pansies are eminently favoured by those who like bold, showy flowers, let the markings or colours be what they may. What becomes of all the Pansies taken into Covent Garden is a problem; these Pansies are sold when in bloom, hence the necessity of removing the plants from their beds at the very time they are expanding their flowers. Continental varieties are remarkably striking in their colours and markings but they do not appear to possess the vigorous, tough, compact habit of our English varieties, being apparently of taller and sparser growth. The large fancy type has raised the standard of quality considerably, and hawkers experience no difficulty in disposing of them, yet the beauty of bedding Pansies and of all the Viola race lies not in their large size but in their colour, form and delicate odour. It is obvious, however, that to keep the plants true to type and uniformity of growth and colour they must be propagated by cuttings or division. Seedlings grow stronger and flower more freely than plants raised from cuttings at half the cost, but those who find it difficult to raise seedlings can buy plants to bloom at almost any season of the year from the best Scotch and English growers who make a speciality of them.

Superb strains of Pansy and Viola seeds may be purchased from the same growers, and seedlings come fairly true to colour. If the seeds are sown in a cool house or frame at this season of the year, or later, the seedlings will be strong enough for pricking out during the summer and should be moderately strong in the autumn for planting: there will be little danger of injury from frosts, although it is wise to have a few plants in reserve to replace failures. *F. Jordan.*

## INDOOR PLANTS.

### POINSETTIAS.

IN northern India the popular Poinsettia is used for many purposes, but chiefly to brighten gardens during the duller time of the year, when there is little else but Chrysanthemums in bloom. When planted in groups on slightly elevated ground, the Poinsettia forms in a few years a large, spreading bush or shrub ten feet to twelve feet high, and when in bloom is one of the most gorgeous objects conceivable. As it forms bracts and flowers on the wood of the current year, it is necessary to cut the growths back to two or three buds from the base after flowering. The stems removed are cut into lengths of six or eight inches and inserted in sand, either in the open or in pots, for no plant strikes more readily from this kind of cutting.

Judging from the "follow my leader" habit at home, there is much to be learned before Poinsettia cultivation becomes of real commercial value. Although Poinsettias revel in heat during the summer months, they are far from being as delicate as the average gardener considers them. For many years it has been customary at home to wait until young growths

appear before obtaining cuttings, and frequently a large percentage of these cuttings die, and many plants are weaklings from start to finish. Why not, before destroying the old stems, use them for propagating? If they are healthy they will give far better results. Again, rather than throw the old plants away, which again is customary, why not pot them up at the time of new growth, and so increase the number of flower heads per plant?

Poinsettias should not be coddled at any time but kept in the open air so long as possible, even into the month of October. If the plants are well-grown, strong and sturdy, they will almost look after themselves, provided protection from actual frost of more than 2° is given.

It is a common sight in the Punjab during January and February, when the cold winds are beating down from the snow-covered ranges of the Himalayas, and when actual ice is visible near by, to see thousands of these gorgeous plants thoroughly happy in their surroundings with only the partial shade afforded by a few overhanging branches of trees. It is only natural, when coddled in stove heat at the very time when they least require it, the leaves and bracts become so tender that the least breath of cool air makes them flag, and therefore useless for any other purpose than hot-house decoration.

Poinsettias are very obliging plants, as their requirements are few. They dislike too much water, so that ample drainage is necessary: a mixture of sandy loam with a little leaf-mould added is an ideal rooting mixture. I hope some gardeners, before throwing away their old plants, will try cutting up the stems in six-inch lengths, severing them below the joints as is customary with woody cuttings; lay them aside until the milky sap has dried up, and then place them in five-inch or six-inch pots, in quantities of six or eight, in an open compost. To prevent the soil drying unnecessarily quick, I would recommend each pot be placed within another empty pot a size larger, filling in the space with moss or soil. After a year's growth and the plants have again been cut down, they should become in the second year a batch of sturdy, shrubby specimens, particularly if they get no warmer quarters than a warm greenhouse, and certainly no stove heat. *George Burrows, Eastbourne.*

## BULB GARDEN.

### SEEDLING SNOWDROPS.

SOME time ago (April 19, 1924, May 2 and 16, 1925, and January 30, 1926) a keen correspondence took place in your columns concerning the seedling of Snowdrops. I am not sure whether the writers arrived at a satisfactory conclusion, but I send you three seedlings to emphasize the fact that Snowdrops produce viable seeds, and that seedlings may be raised without much trouble. In April, 1926, I gathered some of the green pods of Snowdrops and placed them at once in a three-inch pot, which I plunged in the soil close to the parent groups. Several seedlings appeared, as noted above.

I also enclose a photograph of Snowdrops (Fig. 100) growing at my former home at Wick House, Brislington, near Bristol—now a home for friendless children. I remember quite well that we were not allowed to pick many blossoms, the idea being that so many as possible should produce and scatter their seeds and thus increase the size and density of the display. My own Snowdrops are from bulbs of this old and charming colony of "fair maids of February." (*Mrs.*) *Sarah Thatcher, Manor House, Chew Magna, Somerset.*

### CRINUM POWELLII.

THIS beautiful hybrid between *C. longiflorum* and *C. Moorei* is quite hardy in the majority of gardens. It requires a position in full sun so that complete ripening of the foliage is assured, for on this the successful flowering of the bulb largely depends. An ideal situation for this handsome Crinum is a border at the foot of a south wall, where the plants will receive

the full benefit of the sun, and be sheltered from cold winds.

The border should be well-drained, and a good depth of rich, rather light soil, forms the best planting-medium. It must be remembered that Crinums are gross feeders, and that once established, they are not disturbed for many years: it is therefore desirable to work into the soil some well-rotted stable manure, and a quantity of coarse bone-meal. Planting may be done from March to May. The bulbs are large, and they should be planted with their tips eight inches or nine inches below the surface to ensure the bulbs not being injured by severe frosts.

Established plants amply repay good cultivation; during the summer they should never be allowed to suffer from lack of moisture at the roots, while the frequent application of liquid manure will be found exceedingly beneficial.

The flower stems are three feet or four feet in length, and each bears about eight rose-coloured, wax-like, tubular flowers during August. The white variety, album, flowers a little later than the type; the variety intermedium is of a pale rosy colour. *T. H. Everett.*

## FLOWER GARDEN.

### PYROLA ROTUNDIFOLIA.

THE Winter Green is a native plant, but is so uncommon and localised that few are familiar with it in its natural haunts. Its tufts of rich, green leaves and graceful, Lily-of-the-Valley-like racemes of white, waxen flowers, render it beautiful, both in foliage and flower; whilst an additional attraction is the sweet scent of the blossoms. The flower-spikes attain a height of ten inches or twelve inches, and appear from June to August.

*Pyrola rotundifolia* is not difficult to establish in the garden if a little thought and care are exercised in choosing a situation for it. It is most important to plant good, strong clumps; scrappy pieces often only end in disappointment. It will succeed in light, woodland soil on the outskirts of a shrubbery; a cool root-run being essential. A partly-shaded rockery also forms an ideal situation for this native gem. *T. H. Everett.*

### MIMULUS GLUTINOSUS.

*Mimulus glutinosus* or, as it is sometimes known, *Diplacus glutinosus*, is a greenhouse shrub, and though not often used as such, it makes a very good bedding plant. It flowers freely all through the summer, and the colour of the flowers draws attention to it at once; they are of a rich salmon shading to buff.

The plant is easily raised from cuttings inserted either in spring or autumn; if rooted in August they make fine plants by the following bedding-out season.

The method I employ is to root three cuttings in a small pot under a hand-light in the greenhouse in August, and when rooted, pot them singly and stake the young growths to the required height. This *Mimulus* may be grown on to form large specimens, as the plant does not become bare of foliage at the base. I have grown it to good effect over a ground-work of *Viola Admiration*, with which it forms a pleasing contrast. *George Mackenzie, Cranmer Hall Gardens, Fakenham, Norfolk.*

## ALPINE GARDEN.

### PRIMULA SUFFRUTESCENS.

SHRUBBY Primulas are not common; they include the subject of this note, a species whose native habitat is the heights of the Central Rocky Mountains. I have not found the plant difficult to cultivate, but it has a habit of dying off in patches, which rather hinders its development.

In a gritty, well-drained loam enriched with leaf-mould, and an open situation, in these gardens, *P. suffrutescens* has done tolerably well for some years.

## "LAWNS & WEEDS"

A strange title for a book on Lawns, until one realises that the destruction of the Weeds is the most important point in the construction of a Lawn.

A copy of this very instructive booklet will be gladly sent post free to any address.

### "CARTERS SPECIALITIES FOR YOUR LAWN"

Carters Finest Grass Seed. Ensures a beautiful healthy sward in the shortest time. Carters Worm Killer. An infallible remedy for killing Worms. Carters Grass Fertilisers. To restore worn Lawns. "Carterite" for the destruction of Daisies and other shallow-rooted Weeds.

Full particulars and prices contained in "Lawns and Weeds."

A lawn treated with Carters Worm Killer and Carters Grass Fertiliser.

# The MONRO COMBINATION SEED DRILL

Convertible into a Cultivator with one wheel

With Cultivating Frame - - - - £3 : 17 : 6

Without Cultivating Frame - - - - £3 : 4 : 0

Weight packed 48 lbs. Holds 2½ quarts.

(Full Guaranteed)

Special attention has been given to this appliance and it has been brought to such a degree of perfection that we cannot commend it too highly.

The function of this Seed Drill is most uniform and its action smooth. It will sow in continuous drills or in groups 4, 6, 8, 12, or 24 inches apart.

It has a very wide roller and the line marker is capable of marking at distances varying between 6 and 20 inches and either to the left or right of the drill.

It can be converted into a Cultivator, with one wheel performing the work of sowing, hoeing and cultivating. Furthermore, it will serve as a plough.

In early summer it sends up loose clusters of rosy-carmine flowers with a yellow eye, these being held on slender stems well above the foliage.

The habit of the plant is more or less prostrate, the stout, brittle, green branches terminating in rosettes of long, narrow, dull green leaves which widen to their rounded and toothed extremities. Frost seems to have no ill effect on *P. suffrutescens*, but winter dampness is doubtless one of its troubles. A. T. J.

#### SYNTHYRIS RENIFORMIS.

THIS is a dainty and interesting dwarf-growing hardy perennial with blue flowers borne on racemes or spikes from five inches to nine inches high. The plant is admirably adapted for the cooler or partially-shaded corners of the rock garden. It forms a close, compact tuft of dark green foliage of neat habit and flowers during early spring. It may be propagated by division. L.

### TREES AND SHRUBS.

#### GREVILLEAS.

THOUGH classed as half-hardy shrubs *Grevillea rosmarinifolia* and *G. sulphurea* are much more resistant to frost than many gardeners realise. My specimens were not affected by 20° of frost last winter and I know of plants in a north-west country garden, 800 feet above sea-level, which have proved equally hardy.

The species enumerated grow to about six feet tall, but they are usually seen as shrubs of about half that stature. The foliage of both species is evergreen; dark green in *G. rosmarinifolia*, and a paler shade in *G. sulphurea*. The former bears racemes of bright, rosy-red flowers, whilst those of the latter are of a golden-amber tint.

Here, in the west, the bushes generally begin blooming in autumn. They continue to flower during mild intervals throughout the winter, and are at their best in spring. Our plants are associated with Heaths on an open woodland slope, where the soil is light and poor. These *Grevilleas* make very pleasing wall shrubs, and should be grown in this way where the winters are very severe. A. T. J.

#### BUDDLEIAS.

THE genus *Buddleia* contains many interesting shrubs which are of the easiest cultivation. They grow best in a rich, loamy soil and a sunny situation, but they will succeed in less favoured positions, and flower freely if they are pruned regularly. Propagation is effected from cuttings or seeds; cutting should be resorted to if it is desired to increase a specially fine type, as some species vary considerably from seed. The long, purple spikes of *B. variabilis* and *B. v. Veitchiana* are well-known to all lovers of shrubs, likewise the later-flowering variety, *B. v. magnifica*. Attention of intending planters is drawn to the merits of that distinct and little-known species, *B. alternifolia*. This is an introduction of the late Mr. Reginald Farrer, and is so distinct in every respect from the other members of the genus that it is worthy of more notice from lovers of good shrubs than it has received. *B. alternifolia* is a slender-growing shrub, with small, linear leaves, having long, drooping shoots, giving the plant the effect, in the distance, of a Weeping Willow. The period of flowering is during late May and early June, long before the members of the *variabilis* type are in bloom. As the flowers are borne on the previous year's wood, it follows that the pruning should be done immediately the plant has finished flowering.

The blooms are small and produced in such profusion that the long, slender shoots are entirely studded with them, giving the whole plant the appearance of a fountain of flowers, which are delightfully fragrant. For a group in a sunny position on the lawn or for mingling with other shrubs, it is unsurpassed in its season. As this species varies in colour considerably from seed, if a specially good form appears

it should be increased by cuttings of half-ripened wood, which will root freely.

*Buddleia Colvilei*, which is probably the handsomest species of the genus as we see it flourishing in the milder districts of the country, is worth trying under the protection of a wall in less favoured parts, as it is a handsome plant with large leaves and long, drooping panicles of rose-coloured flowers.

*B. nanhoensis* is a dwarf form of the *variabilis* type, and is valuable where space is limited. This is also a most variable plant from seed, and only the best forms should be perpetuated.

*B. globosa*, a native of Chile, is an old plant, having been introduced so long ago as 1774. It is quite hardy in most districts. The flowers are orange-yellow and sweetly-scented.

All the varieties of the *B. variabilis* section flower on the young wood, therefore they should be pruned hard back in spring. If they are allowed to grow at will they soon become straggling bushes with weak wood and poor panicles of flowers.

FIG. 103.—LIME TREES OF BOURLON WOOD (AFTER TREATMENT) IN 1926.

*B. alternifolia* should be pruned so soon as the flowering season is over to encourage the development of long, graceful shoots, which will flower the following year. F. W. G.

### HISTORIC LIME TREES AT BOURLON WOOD, FRANCE.

AN interesting example of tree surgery and preservation is to be seen at Bourlon, France, on one of the Canadian Battlefield Memorial sites, situated about nine kilometres from Cambrai, just off the Cambrai-Bapaume road.

The site marks an eminence above the village of Bourlon. Carved on a massive block of stone is the following inscription: "The Canadian Corps on 27th September 1918, forced the Canal du Nord and captured this hill. They took Cambrai, Denain, Valenciennes and

Mons, then marched to the Rhine with the victorious Allies." The site has been planted with a variety of shrubs and trees, but a feature of very great interest is a short avenue of twelve old Lime trees, apparently *Tilia vulgaris*.

It is said that these trees were planted by soldiers of Wellington's army in front of trenches made during the "occupation" after Waterloo. It is recorded that Wellington was in Cambrai, and used to visit the Chateau at Bourlon.

The French authorities asked that special care might be taken to preserve these historic trees. This work came under the supervision of Lt.-Col. Malcolm Ross, D.S.O., the Landscape Officer who was responsible for the designing and planting of the various Canadian Battlefield Memorial sites. The condition of the trees (Fig. 101) was very parlous indeed at the close of the late war, there being large cavities in the trunks and shattered branches, the result of shell fire. Shortening of the main branches and cleaning the cavities took place during the autumn of 1921 and spring of 1922.

The cavities, some of them a yard across, and of considerable depth, were treated with copper sulphate solution after being cleansed, and then filled with cement, the surface of which was roughened and touched with paint to conform more closely in appearance with the natural bark. Fig. 102 shows a large wound which was so treated. Suckers, freely produced, were removed and new ones prevented from developing. Fig. 103 shows one of the trees as they appeared in the autumn of 1926 with a considerable amount of young growth.

New bark is visible here and there, but it is not expected that the larger wounds will heal over completely. The trees are too old and shattered for such extensive growth to take place, but it is hoped that new bark will develop sufficiently to form an airtight joint over the edge of the concrete. The work which has been done, supplemented with periodic attention, should ensure the preservation of these noteworthy specimens for many years to come. A. B. M.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

**Editors and Publisher.**—Our correspondents would oblige delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notices printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**Illustrations.**—The Editors will be glad to receive and select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## A REVISION OF VIOLAS.

THE Section on *Violas* in Vol. 2 of *The English Rock Garden* is the most complete presentation of the family that has been published in English. It comprises notes on some 130 species and varieties. Shortly before the war, Mr. Irving wrote that there were about 200 known species of *Violas*, of which about fifty were in cultivation, mostly in botanic gardens. To-day it is correct to state that there are approximately 450 known species of *Violas*, of which, perhaps, upwards of 130 are in cultivation, mostly not in botanic gardens, but in professional or amateur gardens throughout Europe and the United States. It is also safe to state that some, if not many of the best *Violets* and *Violas* have not yet been introduced into cultivation in England. Who, for example, has yet seen the magnificent *V. pedunculata*?

During the present century a very large amount of research work has been done in the *Viola* family; notably by Becker in Germany, and by Brainerd, Piper and others in America. Much of Becker's work as regards European *Violas* was accomplished before Farrer produced *The English Rock Garden*, but was not incorporated therein. Further, Farrer's account of the American *Violets* was largely taken, I imagine, from Britton and Brown's *Illustrated Flora*, and does not incorporate the later work of Brainerd. The continuation of research work such as I have described does not make the account of Farrer any the less useful, especially as nothing can supersede the personal touches arising out of inner knowledge with which Farrer's work was illuminated in all cases where he had personal acquaintance with the plant he described. It may, however, be of value to incorporate into the *Viola* Section of *The English Rock Garden* the modifications arising out of later researches. It is not intended to re-write the Section (which to anyone not similarly gifted with Farrer's vocabulary would be impossible), but to publish notes under each of Farrer's headings as may be necessary. These articles, therefore, should be read in relation to Farrer's paragraphs, and the same headings accordingly are used. Where there is nothing to add, the relative heading will, of course, not appear here.

*V. adunca*, J. E. Smith, is now to be regarded as a sub-species of *V. rupestris*. The term

"woodlander" is somewhat misleading as though it grows in woods, it frequents dry, sandy places and arid pastures as well as light brushwood. The flowers rise well above the leaves, and are coloured violet-purple, light or dark. The *Kew Handlist*, 1925 shows this wrongly as synonymous with *V. canina*, an error due to the American botanist Gray. It is a much finer species.

*V. aetnensis* is not a form of *V. calcarata*, but should be known as *V. heterophylla* sub-sp. *aetnensis*. For *V. heterophylla* see below.

*V. aetolica*, Bois. and Heldr., is given by Halacsy as both annual and perennial, like other tricolor *Violas*. The colour of the type is yellow; that of the variety *heterosepala* either all yellow or variegated. The variety takes its name from the fact that the two lower calyx lobes are larger than the others. There is a *Viola* offered in catalogues under the name of "oetholica," which seems to me to be this variety.

FIG. 104.—ARCTOSTAPHYLOS MANZANITA IN THE EDINBURGH BOTANIC GARDEN.

(see p. 213).

*V. alpestris* is generally perennial. The typical form is generally yellow or sulphur. The more or less blue form is *V. polychroma* from Austria.

*V. altaica*, Ker-Gawl, is not one of the "great great grandmothers of our garden Pansies." Dr. Wittrock, the Swedish botanist, who has given great attention to this matter, states, "Reliable statements prove that dating from 1816 *V. altaica*, Ker, a native of Siberia and the Caucasus, was cultivated in England. It is more than probable that this species played some slight role in producing some of the Pansies of those days. Several authors have even ascribed so much importance to the part played by *V. altaica* in the origin of the Pansies that they consider it their real parent. This is, however, in my opinion, a mistake, as, with the exception of bearing large flowers, the Pansies of our century have scarcely a single characteristic in common with *V. altaica* and this species seems always to have been—as it still is—a great rarity in European gardens." It is now taken out of the *calcarata* section

trace I can find of the latter name is (1) that of Sieber, the botanist of Cretan species, which is synonymous with *V. arborescens*; and (2) that of Forskål, who published a flora of Egypt in 1775. The latter appears to be identical with *V. arborescens* from Algeria. This species is purely Mediterranean, and is abundant in its area, yet there seems to be great difficulty in procuring it. I have had it from Cape S. Vincent in Portugal, and from Malaga in Spain (where Mr. Lofthouse recently collected it); and under the synonym of *V. suberosa* it is grown in the Edinburgh Botanic Gardens. *V. suberosa* should be known as *V. arborescens* sub-sp. *serratifolia*. It is the Algerian form, only to be distinguished from the type by the serrate leaves. The species is well worth growing.

*V. arenaria* ought to be *V. rupestris*, Schmidt, the name now correctly adopted by the *Kew Handlist*. Becker, in his latest account, states that it is absent from Great Britain; but I have recently had it from its one station in

Upper Teesdale, sent me by Mr. Lofthouse. The colour of the flowers varies from blue-violet through all shades to white. *V. rupestris* is peculiar in its distribution, being found low down, as in the Forest of Fontainebleau, near Paris, and as high as 14,000 feet; it is fairly common in Europe; it is found in the Himalaya and Siberia and crosses over to Alaska, whence it descends into the United States until in the mountains of California it varies into *V. rupestris* sub-sp. *adunca*. The *Viola* which is offered in English catalogues as *V. rupestris rosea* is invariably *V. sylvestris*; and there is another nursery *rupestris* which is a garden *Viola* of the Maggie Mott order.

*V. atriplicifolia* of Greene should be known as *V. purpurea* var. *venosa*. It is an alpine species from the Sierra Nevada mountains in California. *E. Enever Todd*.

(To be continued).

out-of-doors at present, and from their habit and attractiveness suggest they would make fit subjects for early forcing for greenhouse decoration.

The early species of *Rhododendron* are daily adding to the number of flowering shrubs. In the *Rhododendron* House the tall, tree-like *R. argenteum*, a native of Sikkim, has again produced some wonderful large blooms. Many inflorescences have fifteen to twenty large white flowers, and each individual bloom, with a purple blotch at the base, is not less than two inches across. It is an imposing picture in early spring. *R. Thomsonii*, also a native of the same country, when viewed with the sun behind the numerous, glossy, deep blood-red flowers, is a fine sight, while a specimen twenty feet high of *R. arboreum* is just opening its flower-buds, and will be ablaze with rich crimson flowers in a few days.

Out-of-doors, a very handsome plant of

when in flower, are blooming profusely on a high mound at the back of the rock garden. Although common shrubs, they are invaluable for their beautiful spikes of sweetly-scented flowers. Another of the same family, *D. Blagayana*, is one of our most useful rock plants. Easily propagated by cuttings and planted in a position where sufficient moisture is available, it will produce young growths which, if kept pegged down, will cover a very large area in a short time. Its white flowers are very beautiful and scented.

Spring-flowering bulbs have made rapid progress with the mildness of the season. *Crocus vernus* and varieties, *C. banaticus* and others, have brightened up the lawns and side-paths of the rock garden. Around trees in borders such plants as *Scilla amoena*, *S. bifolia*, with cobalt blue flowers, are worthy subjects. *Colchicum alpinum* and *Bulbocodium vernum*, with their pink flowers, are very pretty. *Eran-*

FIG. 105.—GIANT STAR PRIMULAS AT HILLSIDE, READING.

(see p. 215).

## NOTES FROM EDINBURGH.

LENGTHY periods of sunshine have been a pleasing feature of the opening days of March. Little or no frost has been registered and plants and shrubs out-of-doors have taken advantage of this mild period. Many have excelled themselves in producing beautiful young foliage and handsome flowers. Amongst the most prominent flowering shrubs the Californian *Arctostaphylos Manzanita* (Fig. 104) may be considered a favourite. Although introduced to this country in 1897 it is not yet a common shrub in our gardens. Perhaps this is due to an erroneous idea that the plant is difficult to propagate vegetatively, but new methods of propagation have shown that cuttings may easily be struck in sand frames about the end of May or beginning of June. The white or pinkish flowers of *A. Manzanita*, borne in trusses, are very prominent among the dark green, leathery foliage. It is a slow-growing plant and does best in a well-drained position, treated like other members of the *Erica* family.

*Viburnum fragrans*, from China, and a Himalayan species, *V. grandiflorum*, are two of the earliest of this genus. Both are in flower

*R. Smithii* is nearly at its best, with numerous trusses of dark crimson flowers perched on a circle of drooping leaves. This habit shows the flowers to great advantage. A hedge fifty yards long of *R. praecox* covered with opening flowers was partially blighted by February frosts. The scorched appearance of the top half is somewhat counter-balanced by the countless number of beautiful pink flowers of the under part, and the whole looks as if it had been suddenly put into a fire and quickly drawn out again. One isolated specimen, however, is in full flower from a height of seven feet down to a few inches from the ground. Leafless branches with such a profusion of flowers give it a Peach-like appearance.

In a sheltered part of the border the Japanese *R. quinquefolium* is clothed with soft pink flowers. It also is still leafless and very unique. *R. acuminatum*, near by, is somewhat similar in habit, and there is little between them for beauty at this season. The dwarf species are well represented by *R. intricatum*, a true rock-garden plant. Its small leaves and long, blue flowers commend it as such, and it should be the aim of lovers of the genus to acquire a plant of this delightful little shrub.

Groups of *Daphne Mezereum*, also leafless

this *cilicica*, with yellow flowers, surrounded by its collarette of green leaves is delightfully at home under the protection of a giant Lime tree.

*Iris unguicularis alba*, in a sheltered border, never fails to charm with its white flowers, while *I. reticulata* and the varieties *histrioides* and *Krelagei* make the colour scheme complete. *A. McCutcheon*.

## NOTES FROM WISLEY.

THE majority of the *Lachenalias*, often known as Cape Hyacinths, which are on trial at Wisley, are now in flower. The varieties sent in are very similar, all having yellow flowers with or without additional red and green colouring. One of the best of the self-coloured varieties is the deep yellow *Leiden*. The shape of the flowers, however, is not so pleasing as in the case of many other sorts, such as *Spa*, the blooms of which are suffused with red as also are those of *Lachenalia Nelsonii*. Red predominates in the flowers of *Tipperary*, a dwarfier variety with heavily spotted stems, while each bloom

of Calcutta is tipped with a broad band of dark crimson. Another variety which is flowering well is Canada, with yellow and pale green flowers. The only break away from the yellow, red and green colouring is seen in *L. pendula*, which has turned from orange-red to rose-pink.

In the same greenhouse the *Fre-sias* on trial have commenced to bloom and to diffuse their pleasant fragrance. Among the yellow-flowered varieties, Buttercup, Daffodil and China, with brown lines on the perianth, are in bloom, while *Foretaste* is the first of the mauve-coloured varieties to flower.

Many *Saxifrages* are now in bloom in the rock walls in front of the Laboratory, and of these none looks more attractive than *S. Griesbachii*. The Wisley form of this plant has a much larger rosette than the type, and the flowers are of a deeper crimson. Some splendid specimens are to be seen in flower in the new Alpine House (Fig. 106), which is now looking extremely well, and patches of vivid colours, such as one associates with a summer herbaceous border, are occasioned by the bright blue *Pulmonaria*

In the wild garden, *Rhododendron præcox* is flowering exceptionally well and has so far been fortunate in escaping damage by frost. In addition to its own leaves, the dark green foliage of adjoining plants of *Rhododendron Thomsonii* help to show up to still greater advantage the masses of pink blossom. Comparatively few blooms are to be seen on the yellow-flowered *R. lutescens* which, however, even at the best of times, is never very liberal with its flowers. Other shrubs in flower in the wild garden include *Camellia japonica* and *Pieris japonica*, which, unlike the former, rarely fails to flower well at a time when flowering shrubs are scarce, and although not completely hardy, rarely gets badly damaged by frost when planted in a sheltered spot.

In the entomological department, further trials of new tar distillate washes have recently been carried out in the experimental orchard in order to test their power to kill the eggs of psyllæ and aphides. Peach trees have also been sprayed with Burgundy mixture as a preventive against Peach leaf-curl.

injury which may arise owing to its being in a state of disrepair.

The wisest thing to do, therefore, if you have such a stile on your land, is to leave it severely alone, and in all probability when it gets broken or unsafe the local council will see that it is put right. If, however, they notify you that the stile needs repairing, the best course to take is to write and explain that if they want the stile repaired, they are at liberty to come and repair it, at the same time asking upon what authority they have asked you to do the repairs. *H. A. Sharman.*

## THE VILMORIN FAMILY.

ALTHOUGH a history of the famous horticultural family of Vilmorin has already been given in several French publications, the following notes, tracing its origin, may prove of general interest.

M. Philippe Victoire Leveque de Vilmorin was the first of the family to enter the seed trade. He was an educated gentleman of Lorraine origin, who married in 1773 Adélaïde d'Andrieux, whose parents had a seed and plant shop on the present site of the head offices of the firm, in Paris, Quai de la Mégisserie, called at that time Quai de la Ferraille. Philippe Victoire became a partner of M. Andrieux, and soon after the latter's death, in 1779, the owner of the firm—which first took the name of Andrieux et Vilmorin—assumed the title of Vilmorin-Andrieux. Philippe Victoire L. de Vilmorin, who was a great plant lover, became acquainted with the leading botanists of his time and did much to improve and distribute good plants, trees, shrubs and bulbs, and to detail the best methods of cultivating them. He was one of the first in France to publish catalogues of seeds and plants; he died in 1804, leaving the business to his eldest son, M. Pierre Philippe Andre Leveque de Vilmorin, who was already a partner in the firm, and took a keen interest in the improvement of cereals, forage plants, trees and shrubs. For experiments undertaken in this connection, he acquired land, both at Verrières le Buisson, for herbaceous plants, and at Les Barres, Loiret, for trees. These estates extended, and the first is probably the largest establishment in the world for the improvement of plants generally, and the selection and production of stock seeds; the second is the principal arboretum in France, now in the hands of the French Government, and used as a school of forestry. It was to M. Pierre P. de Vilmorin that Parmentier's collection of Potatoes was entrusted in 1815, by the Société Royale d'Agriculture, and which has been since grown at Verrières. Being deeply engaged in scientific and experimental work, he took partners to assist him in the direction of the seed firm, and it is from that time that "& Co." was added to the title of Vilmorin-Andrieux. He retired in 1843, passing the business to his eldest son, and died in 1862.

M. Pierre Louis Francois Leveque de Vilmorin, born in 1816, was twenty-seven years old when he became the head of the firm. To him the scientific world and the practical growers as well, owe a debt for his systematic studies of heredity in plants, which led him to commence the process of individual selection. His method of growing separately the produce of each selected seed-bearer has since been applied to all sorts of plants. This now well-known method has been and still is of immense importance in the improvement of plants and the fixation of new varieties or hybrids.

Furthermore, the name of Louis de Vilmorin will for ever be associated with the high improvement of Sugar Beet, of which he carried the percentage of sugar, in the strain that still bears his name, to a degree which has been but little surpassed since. His wife, Madame Elisa L. de Vilmorin, assisted him in his experiments and trials, and published the "Monograph of Strawberries" in *Décadence du Jardin fruitier du Muséum*. She died in 1868.

Louis L. de Vilmorin died in 1860 at the early

FIG. 106.—THE NEW ALPINE HOUSE IN THE R.H.S. GARDENS, WISLEY.

*angustifolia* var. *azurea*, *Iris reticulata*, *Morisia hypogæa* and rich-hued Primrose hybrids. Among the less conspicuous plants in this house are the rare *Androsace pyrenaica*, with tiny white blooms, and *Primula Locz' i*, a miniature, pink-flowered Primrose. The pearl-white flowers of *Shortia galacifolia* are now showing, together with those of *Sisyrinchium grandiflorum*, which are maroon in colour. An extremely pretty *Kabschia* hybrid *Saxifrage* is seen in an unnamed Wisley seedling. The flowers are similar in shape to those of *S. Jenkinsii* but are bright rose in colour. An attractive yellow-flowered *Saxifrage* in bloom in this house is *S. Borisii*.

On the rock garden *S. oppositifolia* var. *splendens* and the pale yellow hybrid, *Mrs. Leng*, are seen to great advantage in flower in the crevices of a recently reconstructed rock face. Most of the varieties of *S. Burseriana* have now passed their best, but an exception is the late-flowering *S. Burseriana speciosa*, of which there is a good patch near the top of the rock garden. *Anemones* in flower include *Anemone Hepatica*, *Anemone blanda* and *A. blanda* var. *sythica*, the flowers of which are white except for a blue tinge on the reverse of the sepals.

The borders at the foot of the rock garden are now very gay with *Crocuses*, *Leucojums*, *Scillas* and *Primroses*, including the Wisley blue variety which has flowered in these gardens ever since it was discovered here by Mr. Wilson, more than forty years ago. *Viola odorata*, which is blooming very freely, is also a feature of these borders, while in the border in front of the Laboratory *Scilla sibirica atrocoerulea*, with large, dark blue flowers, is in bloom.

Good progress has been made with the new flower trial grounds situated on the site of the old kitchen garden, and the seeds sent in for the trial of annual Poppies have already been sown. *J. R. Grant White.*

## STILES.

Most of the stiles in this country are used by foot passengers to reach a footpath in a private field over which the public have a right of way. In the case of such stiles, the question of whether the owner of the field is under any liability to keep them in repair is always arising, and sometimes the more important question of whether he can be sued in damages for any injury suffered by the users of the stile owing to its being in a defective condition, crops up.

As a general rule, the mere fact that a public footpath crosses a fence by means of a stile does not impose upon the person to whom the fence belongs any liability to repair the stile. Neither does the law impose such an obligation on his tenant. Such a liability may, however, be acquired if the stile has been repaired for the benefit of the public for a number of years, although if the owner or occupier of the field repairs it for his own benefit, however often done, this would not impose any obligation on him to repair it for the public. From this it follows, that if a man is not liable for the repair of a stile, he cannot be made responsible for any

# "IT WORKS— INSTEAD OF YOU"

£ 4 0

The  
17-inch  
'Governor'  
(Air-Cooled)  
A strong, light  
machine that will  
not cause ridges  
on the softest turf.

The 'Governor' mows your lawn better, quicker, more cleanly, more evenly and more easily, saving its cost in the first season. The 'Governor' incorporates many essential features not to be found in any other machine, and is strongly built, yet light enough to preserve the smoothest surface.

### WHAT USERS SAY:

"The 'Governor' Motor Lawn Mower gives me the greatest satisfaction. In two half days the gardener does by himself mowing which previously took him nearly two whole days with an additional man to help. I am strongly recommending it."

E. W. RAVEN-HILL,  
Park House, Brentwood.

"It is easy to start, easily manipulated in confined spaces and has made a good job of the heaviest growth without any trouble whatever." (Extracted).

"We have nothing but praise for the water-cooled 'Governor.' It gives no mechanical trouble and works economically and quickly. Absence of complicated parts is a strong point in its favour."

J. H. MATTHEWS,  
Aldridge Cricket Club,  
Walsall.

"The 'Governor' is quite the best mechanical job of its sort that I have yet seen."

FREDK. A. FITCH,  
M.I.M.T.,  
Tunbridge Wells.

"I do not wish for a more efficient machine, and the very moderate price is an additional attraction."

M. W. MYERS, D.D.  
Frodsham, Cheshire.

12-months' Guarantee with each machine. 5% Discount for Cash. Easy Payment Terms if desired. Free delivery to any station in Great Britain or at port in Ireland.

## CYCLAMEN

Awarded R.H.S. GOLD MEDAL

THE POPULAR GREENHOUSE PLANT.

The greenhouse Cyclamen now ranks as the King of the winter-flowering pot plants. If you have overlooked the previous opportunity of growing these valuable plants, now is the time to prepare for next winter's display by obtaining seed, seedlings, or plants in 60's. We are still in a position to supply plants in 48's in full flower for immediate decoration, price on application. Ask for a copy of our useful little Treatise. Our Catalogue is the most complete Cyclamen list published—a post card will bring you a copy.

J. W. FORSYTH

Cyclamen Grower and Floriculturist

PUTTERIDGE :: :: LUTON

age of forty-four years, leaving three sons, the eldest of whom became first associated with his mother, then, in 1873, the head of the firm in association with his brother Maurice, the third son, Philippe, having been killed during the war of 1870-71, at Le Mans, on the last day of the war.

M. Charles Henry Louis L. de Vilmorin, born in 1843, carried on still more extensively plant experiments his father and grandfather had so successfully begun, paying special attention to the improvement, by crosses and selections, of many kinds of cultivated plants: vegetables, Sugar Beets, Wheats and flowers as well. He classified the Potatoes of his collection in a manner similar to that used by his father for the classification of Wheats, and published the first edition of *Catalogue methodique et synonymique des Pommes de terre*, two editions of *Catalogue des Froments*, and also *Les meilleurs Blés*, one of the largest works on the subject. He also revised and enlarged *Les plantes potagères* and published a number of papers on various subjects. He died suddenly in 1899, leaving five sons and two daughters. His wife, Madame Henry L. de Vilmorin, now nearly eighty years of age, lives in the family estate at Verrières, spending some of the winter months in her Riviera residence.

M. Maurice L. de Vilmorin the younger brother of M. Henry L. de Vilmorin, also engaged in the management of the firm. His country home was at Les Barres, Loiret, and he devoted himself more especially to the study of forest and ornamental trees, and established close to the arboretum of his grandfather the largest collection of shrubs in France, of which he published the catalogue, in 1904, under the title of *Fruticetum Vilmorinianum*. Up to his death, in 1918, he maintained close relations with missionaries living in China, and received from them several thousand kinds of seeds, mostly of woody plants, many of which proved to be new species and among them the famous *Davidia involucrata*, which flowered at Les Barres in 1902 for the first time in Europe.

M. J. M. Philippe Leveque de Vilmorin, the eldest son of Henry, born in 1872, entered the firm when still young, and became the head of the business in 1899, after the death of his father. Carefully prepared for his duties, his botanical and scientific inclinations led him to enlarge at first the collections of herbaceous and woody plants in his private park, to have a large rockery built, much in the style of the one at Kew, and to add to the chemical laboratory built by his father, another one for biology and pathology. Experiments and crossings in cereals and Potatoes were greatly developed, one of which, on the premature lifting of seed tubers, he just finished before he died.

When Mendel's law was brought to light, he devoted himself entirely to its study, started a number of experimental crosses in Peas, Wheats, etc., and soon became the first geneticist in France. Many readers interested in these matters will remember the Genetic Congress held in Paris in 1911, of which he was the secretary and in fact the organiser.

In 1900 he married Mademoiselle Mélanie de Dortan, whose old French family has a large estate at Dompierre les Ormes, Saône et Loire, and Monsieur Philippe, as he used to be called, soon started an arboretum on one of the farms his wife had inherited, covering about fifty acres, for the trial of all forest and ornamental trees and shrubs likely to succeed in the hard conditions of soil and climate of that hilly region. This arboretum, named Pezanin, started twenty-five years ago, already begins to bear fruit, namely, to show the superiority of Conifers over deciduous trees. For instance the Douglas Fir so surpasses the Pines and other Firs grown in France that it has induced foresters to plant it more and more extensively. His eldest sister, Mademoiselle Elisabeth de Vilmorin, married in 1896 Count d'Estienne d'Orves, who soon became a partner of the firm. In that capacity, he showed remarkable business ability. As a lover of Sweet Peas, he did much to develop the culture of that flower in France, while as a golfer he favoured the improvement of turf seeds. His pursuits brought him into

close touch with English and American seedsmen, amongst whom he numbered a great many friends who sincerely mourned his untimely death, when this took place on March 1, 1926.

We may now consider the present members of the firm.

Madame Philippe L. de Vilmorin (see p. 206) has, since the death of her husband, taken deeper and deeper interest in the management of the firm, thoroughly maintaining the collections, continuing the experiments and scientific work of M. Philippe, and assisting some of them, such as the arboretum at Pezanin and the library, from her own private means. In addition she takes a kind and personal interest in the staff, and receives visitors with grace and kindness. She has been Chevalier of the Legion of Honour for some years, and not long since was promoted to the rank of Officier.

Monsieur Jacques L. de Vilmorin, eldest son of M. Maurice, entered the firm some years before the death of his father, taking in hand the Sugar Beet seed production, concerning which he published in 1925 a complete book as his thesis for the degree of Doctor in Science.

FIG. 107.—GIANT FLORISTS' PRIMULAS AT HILLSIDE, READING.

Besides engaging in the general management of the firm, he has also taken over the direction of the experiments and improvements of Wheats, and other Cereals. During the war and since the death of his first cousin Philippe, Monsieur Jacques L. de Vilmorin has assumed the direction of the experimental and scientific work carried on at Verrières. He is a member of the Académie d'Agriculture and has won the Legion of Honour.

M. Henry Louis de Vilmorin, younger brother of M. Philippe, entered the firm after the war, through which he passed safely from beginning to end, returning with the Legion of Honour. Beyond the commercial management of the business, he has devoted himself to the study and improvement of the Potato. He is fairly well-known amongst English and Scotch growers, often attending the trials at Ormskirk, where he sends every year a large number of the leading varieties grown in France and some of his own seedlings for trial of resistance to wart disease.

And now the sixth generation of the Vilmorins has come forward in the person of M. Roger de Vilmorin, son of Madame Philippe. A science licentiate, he recently entered the firm, and is now passing through its numerous departments to become acquainted with both the business and cultural sections before taking the place occupied by his father.

## PRIMULAS AT HILLSIDE, READING.

ON one of the highest positions in Reading, a member of the Palmer family built a fine house and created a garden well supplied with green-houses. In course of time this little estate came into the hands of Mr. Leonard Sutton, senior partner of Messrs. Sutton and Sons, who is not only a seedsman and a keen business man, but a gentleman with a great love for flowers and plants, who is never happier than when in his own home and garden. No matter at what season of the year a visit may be made, the Hillside gardens are invariably interesting and remarkably well-kept. In the early months of the year, however, the Primulas, Cyclamen and Cinerarias are especially attractive, arranged in a conservatory and in several greenhouses.

Readers must not conclude because Mr. Leonard Sutton belongs to the Reading firm of seedsmen and lives in Reading that the display at Hillside is derived from and maintained by plants grown at the nursery. Not at all.

Mr. Townsend, who has had charge of the Hillside gardens for many years, and Mr. Janes, in charge of the nursery, are friends, but in regard to their respective charges, they have no dealings with each other.

Mr. Townsend obtains his seeds, raises and cultivates his plants, as do other gardeners, but with this difference, he has to maintain a very high standard of excellence, otherwise unfavourable comparisons might be made between his plants and those at the nursery. How well Mr. Townsend succeeds is indicated by the illustrations (Figs. 105 and 107), and by the pardonable pride Mr. Leonard Sutton takes in his efforts.

At Hillside just the usual reasonable facilities are provided; painstaking skill does the rest. About 900 Primulas and 200 Cyclamens are grown each year, and when in flower they are grouped effectively in the several glass structures. A raised group of the stellata variety Coral Pink was very beautiful a few days ago, while the large-flowered Reading Blue, Pearl and Reading Pink provided a contrast to its lighter inflorescences. Vesuvius Star and Ruby Star are brilliant varieties, the crimson of the former being enhanced by the deeper crimson around the orange eye; Crimson King, Brilliant Rose and Giant White form another pleasing association. Giant White Star is charmingly graceful,

Readers must not conclude because Mr. Leonard Sutton belongs to the Reading firm of seedsmen and lives in Reading that the display at Hillside is derived from and maintained by plants grown at the nursery. Not at all.

Mr. Townsend, who has had charge of the Hillside gardens for many years, and Mr. Janes, in charge of the nursery, are friends, but in regard to their respective charges, they have no dealings with each other.

Mr. Townsend obtains his seeds, raises and cultivates his plants, as do other gardeners, but with this difference, he has to maintain a very high standard of excellence, otherwise unfavourable comparisons might be made between his plants and those at the nursery. How well Mr. Townsend succeeds is indicated by the illustrations (Figs. 105 and 107), and by the pardonable pride Mr. Leonard Sutton takes in his efforts.

At Hillside just the usual reasonable facilities are provided; painstaking skill does the rest. About 900 Primulas and 200 Cyclamens are grown each year, and when in flower they are grouped effectively in the several glass structures. A raised group of the stellata variety Coral Pink was very beautiful a few days ago, while the large-flowered Reading Blue, Pearl and Reading Pink provided a contrast to its lighter inflorescences. Vesuvius Star and Ruby Star are brilliant varieties, the crimson of the former being enhanced by the deeper crimson around the orange eye; Crimson King, Brilliant Rose and Giant White form another pleasing association. Giant White Star is charmingly graceful,

and will associate with any and every other variety; at Hillside it serves to throw into sharp relief a new, deep blue Star variety with a yellow eye, as yet unnamed.

*Primula malacoides* is grandly grown at Hillside, but never grouped with the Chinese types. Some very fine forms have been selected by Mr. Townsend, who is as keen to observe and secure improvements as any member of the nursery staff; indeed, there is a genial and healthy competition between the two establishments. The most effective *Cyclamens* during our visit were Cherry Red, Giant Crimson and Giant White, these being grouped in a bold bank in the conservatory. On one plant, in a forty-eight-sized pot, we counted thirty-eight flowers in addition to many buds.

*Cinerarias* were not yet at their best, but Pink Pearl, with lovely rose-pink, large flowers on a dwarf plant, was very striking. Blue Gem, Reading Gem and Forget-me-not Blue were beginning to make a display. The last is a dwarf, intermediate variety needing somewhat smaller pots than other sorts, and special care in watering, but it thoroughly merits the extra attention it requires.

## LEAF ROT OF THE CARNATION.

(Concluded from p. 197).

The fungus causing the disease penetrates the leaf from one surface to the other and also fills the cavities of some of the epidermal cells, whence the hyphae enter the thick outer wall and spread for a considerable distance, immediately under the cuticle. In the thick outer wall of the epidermis the hyphae increase in quantity and become so intertwined as to resemble a genuine tissue—the so-called plectenchyma (Fig. 109).

In certain places, the plectenchyma becomes rather thicker, and consequently lifts up the waxy cuticle in such a way as to resemble a small dome. At the same time, large numbers of spores are formed on the exceedingly short mycelial branches, and the cuticle is caused to split under the pressure exerted (Fig. 109). The spore masses are thus exposed to the open air and are ready for distribution by rain or wind. When viewed from above, by means of a lens, the spore masses are inconspicuous and scattered, and are often partially hidden by the folds of the wrinkled and uplifted cuticle and epidermis. When fresh and moist, they are of dull white colour,\* and may be circular, oval, or oblong in outline, measuring up to 0.4mm. in diameter or length. The broken and turned-back edges of the cuticle can be distinguished surrounding the spore mass, and the whole resembles a minute spot of candle grease with a jagged collar of cuticle.

Spores are produced in very great numbers in the pustule, but apparently they are not always immediately dispersed, but in some cases are pushed outwards in the form of an ever-widening disc. When viewed from above, the darker mass of the mycelial base can be distinguished in the centre of the white disc. The disc form of spore mass was only occasionally met with and was only found (in the cases examined) on diseased areas of the youngest leaves which were still tightly clasped together. There is a possibility, therefore, that the disc-shaped mass only results when the exudation of spores occurs in a restricted space. Discs measuring from 0.17mm. to 0.38mm. were observed.

When spores are removed by means of a needle from the minute scattered masses or from the flange of a disc, and are examined in water they are found to be extremely variable in shape and size, especially if taken from a recently formed mass. They are colourless, one-, two- and (most commonly) three-septate. On rare occasions a four- or even five-septate spore occurs. Their shape is shown in Fig. 108.

The end wall of the basal cell is rounded and,

a mature spores, is provided with an appendage which measures up to 10 $\mu$  in length, and which usually projects rather to one side or continues the concave outline of the spore. The apical cell tapers slightly and the long appendage at this end (measuring up to 16 $\mu$ ) is cut off from it by a septum. The spores, including appendages, measure up to 42 $\mu$  in length and 7 $\mu$  in

FIG. 108.—LEAF ROT OF CARNATION.

Spores of the fungus (*Pseudo-discosia Dianthi*) showing the characteristic appendages which they acquire at maturity.  $\times 566$ .

breadth, but very frequently masses of spores may be examined which are devoid of appendages.

Germination, which can be induced by placing the spores in a drop of water, takes place readily, and is well advanced at the end of forty-eight hours at room temperature (about 60°F.). A germ tube may grow from any cell of the spore, but where two septa are present, it most commonly grows first from the centre and sometimes from the basal cell. In three-septate spores, it most commonly arises from the cell next to the basal cell. A remarkable feature of the germination process is that the extreme tip of one or both of the appendages may swell and become globular, though this does not always occur. The germination process is illustrated by Höstermann and Laubert.\*

Judging by the fact that the disease was prospering under winter conditions, it would

Parts of transverse sections of the leaf. (Right) Healthy tissue: (a) Cuticle; (b) Thick wall of (c) epidermal cells. (Left) Diseased; showing the fungus mycelium interwoven (plectenchyma) in the thick epidermal wall and a young spore mass or pustule bursting the cuticle. Both  $\times 200$ .

seem that dampness and low temperatures are favourable to the growth of the fungus. As regards measures of control, it is evident that very great care must be taken in the selection of cuttings from diseased stocks, and that such cuttings should be "struck" in sand, kept as dry as possible, and with the minimum of overhead watering. If the stock plants are badly diseased, there will be considerable difficulty in finding suitable shoots which may be used as cuttings, and in this connection it may be mentioned that on the plants examined, so many as twelve leaves of the terminal rosette ("spike"), some only just pushing free from another sheathing leaf, were found to be attacked.

\* Loc. cit., p. 64.

Owing to the fact that the youngest leaves of a terminal bud (centre of a rosette) grow up inside other leaves which enclose them, the contact and friction provides means of infection if any outer leaf is diseased. The leaf arrangement is opposite and decussate, each pair of new leaves being enclosed by a previous pair.

The disease, as already described, is capable of attacking the leaf at any part of its length, but since it is most frequently found at the base, the inference is that accumulated moisture held at the base of the leaf is a factor which aids infection, and if so, this would obviously be increased by overhead watering.

Assuming that a number of healthy cuttings have been secured from diseased stocks, it would be advisable to burn the latter and to "strike" the cuttings under the conditions suggested above. Careful inspections of the cuttings should frequently be made, and any showing signs of disease should be removed and burned. If not in a glasshouse, protection from rain should be provided by covering with frame lights, allowing plenty of air at the sides.

It is at present unknown whether the fungus can also overwinter in another form in decaying Carnation leaves, but because this possibility exists, it is advisable that the cuttings, when rooted, should be planted out in ground as far away as possible from that originally occupied by the diseased stock plants.

If all the original stock had not been destroyed or if the disease were known to be persisting in the neighbourhood at the time that the rooted cuttings are ready for planting out, it might be advisable to protect the latter by dipping the foliage in Bordeaux mixture, or by spraying, using a strength which would not cause damage to the leaves.

We agree with the German authors in considering the present disease to be at least as serious as any of the fungous diseases already well-known to the Carnation grower. Although this is possibly the first outbreak in this country, and although it has apparently only once been recorded on the Continent (Germany),\* it is highly advisable that growers of Carnations, and particularly raisers of new varieties, should at once closely overhaul their stock in order to restrict as far as possible its spread in this country. We shall be glad to examine any Carnation plants which show symptoms of Leaf Rot. *E. S. Salmon and W. M. Ware, South-Eastern Agricultural College, Wye, Kent.*

## THE HYBRID ORIGIN OF LILIAM THUNBERGIANUM, SCHULTES.

(*L. CONCOLOR*, SALISBURY ♀  $\times$  *L. DAURICUM*, KER-GAWL ♂).

For several years I tried in vain to obtain seeds from *Lilium Thunbergianum*, but it was impossible either by self-fertilising or by crossing to obtain an enlargement of the ovary. This behaviour confirmed my belief in the hybrid origin of *L. Thunbergianum*. Its variability is further evidence, and there is the statement that even in Japan it is only known as a garden plant and not endemic. Of this question of hybridity, I received an answer from nature even earlier than I thought.

In June, 1923, I fertilised *L. concolor*, Salisbury, having vermilion-red flowers, sparsely spotted with black, tomentose buds and a green stem—perhaps a form of the variety *pulchellum* Regel—with pollen of *L. dauricum*, Ker-Gawl, the red-flowering type which forms bulbils on the creeping part of the stem. The result was a seed-pod, rather short compared with those of other species of the same section. The reverse cross failed. The bulb of *L. con-*

\*Since the above was written, we have ascertained that the disease occurring on Carnations in the open in Holland, described in *Verl. en Meded. Plantenziektenkundigen Dienst te Wageningen*, No. 41, p. 19, 1925, as due to the attacks of a fungus tentatively ascribed to the genus *Septogloeum*, is the same as the Leaf Rot described above. Specimens sent by us to Wageningen were examined and Dr. T. Schoevers informs us that the fungus previously thought by him to be a *Septogloeum* was then recognised as actually *Pseudo-discosia Dianthi*. In Holland the injury caused was very great, many plants being entirely destroyed.

\* It has been noticed that when the diseased area of the leaf has become older, and the plant has been kept under dry conditions, the spore masses may become faintly tinged with pink and then, in colour, somewhat resemble certain species of *Fusarium*.

colour, which was in its first season after planting was fully exhausted by seed-bearing, a condition perhaps, natural to this species. The light yellowish-brown seeds were sown the following winter and they germinated fairly well. On June 16, 1926, the first seedling flowered, followed by several others, the last opening on July 9. All proved to be *L. Thunbergianum*, Schultes. They varied in growth and in form and colour of their flowers, but only within the limits of *L. Thunbergianum*. Last autumn the bulbs were taken up and they could not be distinguished from those of *L. Thunbergianum*. They had formed bulbils on the underground part of the stem, which grew straight up and was not creeping as in the case of the male parent.

The flowers of the first seedling were similar to those of *L. Thunbergianum* bicolor, only more densely spotted, even more densely than in both parents. The two next were very near to *L. Thunbergianum* biligulatum, the one fairly spotted, the other nearly spotless. Then came others of dwarf habit, of impure red colour, as ugly as *L. Thunbergianum* fulgens, or even more so. The last seedling to flower was very like the first, only the flower was less spotted, not so flat and therefore smaller than the others, while the leaves were shorter and not so spreading. Moreover, its time of flowering was nearly the same as the male parent, therefore it was not transplanted; perhaps in the coming season it will form stolons. This experiment should be repeated in other gardens by using all the forms of *L. concolor*, and I do not doubt that all forms of *L. Thunbergianum* will occur among the seedlings.

In regard to the arrangement of this and related Lilies by E. H. Wilson in his *Lilies of Eastern Asia* (the best book on Lilies ever written in my opinion), his varieties of *L. davuricum*, *Ker-Gawl*; *L. venustum*, *L. Batemaniae*, *L. pardinum* and *L. Wallacei* belong to *L. Thunbergianum*. All the varieties which he united in *L. davuricum*, sub-species *Thunbergianum*, also occasionally form stolons from the base of the bulb.

As mentioned above, it was impossible to get seeds from *L. Thunbergianum*, yet the pollen proved highly fertile on *L. croceum*, Chaix. In June, 1922, I fertilised this species with pollen of *L. Thunbergianum* biligulatum. The seed pods were big and heavy and contained fully-developed seeds. The seedlings first flowered in 1925, and last season for their second time. They proved to be *L. umbellatum* and showed very little variability. The parentage of *L. umbellatum*, most differently recorded, is therefore cleared up. Though among the seedlings there was nothing of special horticultural value, as there was none with flowers better formed than in *L. umbellatum* erectum, or better coloured than in *L. umbellatum* incomparabile, they showed the possibility to obtaining other varieties of *L. umbellatum* by using different varieties of *L. Thunbergianum*. In one point they proved valuable, being more ready to bear seeds than the old varieties, which perhaps are weakened in this respect by their vegetative propagation over a long period.

I send this note to be published first in *The Gardeners' Chronicle*, feeling most indebted to this journal for information on all questions of horticultural hybridisation. Fritz Berckmüller, Hamburg-Volkendorf.

## ECONOMIC PLANTS OF THE BAY ISLANDS (HONOURAS).

(Continued from p. 181).

### COYOL PALM.

THE Coyol Palm, *Acrocomia sclerocarpa*, Mart. (syn. *A. aculeata*) is called Supa in the Bay Islands and in British Honduras, but the Miskito Indians (Mosquito Coast) apply the same name to an entirely different Palm (*Gulielma* sp.), which is not found north of the Mosquito Coast.

The Coyol Palm is found growing wild in all the Bay Islands, but nowhere in large quantities. It prefers dry soil and reaches a height of twenty-five feet to thirty-five feet; the stem is somewhat enlarged at a short distance from the ground and then tapers gradually upwards and downwards. In older specimens the hard shell frequently cracks open at the enlarged section of the stem. The trunk and the leaf-stalks are armed with strong, sharp, three-sided spines, which may be five inches in length, and prevent quadrupeds from ascending the tree. The stem ends in an almost globular crown of drooping, pinnate leaves of dark green colour, which have a length of ten feet to fifteen feet. The dead leaves do not drop off for some time, but remain attached to the tree, merely hanging downward, and their withered, brownish appearance forms a contrast to the more erect, dark green, young foliage.

The Coyol bears bunches of edible, globular fruits of a dark green colour, the size of an Apricot. The extremely hard stone of the fruit takes a pretty polish and is made into ornaments (rings, cuff buttons, etc.). The kernel inside is rich in oil, which in Jamaica is known as Palm oil. This has a pronounced odour of Violets, and is used in making butter, perfumery and Violet soap. A strong fibre may be obtained from the leaves, but locally none is extracted. An intoxicating drink, known as Vino de Coyol (Coyol wine) is made by the Ladinios from the sap of the tree, obtained in exactly the same manner as that of the Cohune Palm, to which it is even preferred.

### CABBAGE PALM.

*Roystonea oleracea* (formerly *Oreodoxa oleracea*), the Cabbage Palm or Yagua, sometimes erroneously called Royal Palm, is very graceful, and the tallest of the Central American Palms, reaching up to 100 feet (30m.). The true Royal Palm (*R. regia* or *O. regia*) is not found at all in the Bay Islands, but it is cultivated in some of the Central American cities; its home is supposed to be the island of Trinidad, and the neighbouring part of the South American continent. It is much smaller than the Cabbage Palm, and it may also be easily distinguished from its more graceful, near relative by its trunk being swollen in the middle and tapering thence both upward and downward.

The heart leaves of the Cabbage Palm are eaten, either pickled or boiled as a vegetable. In flavour they are said to remind one of Cabbage, hence the name. From the centre of the crown of leaves a tall, yellowish spathe, or sheath, projects upwards, like a flagpole or lightning rod. This Palm, like the Coyol, the Royal Palm and the Gulielma, does not have the leaf divisions lying horizontal and in one plane, as in most Palms, but they are tilted at different angles to the midrib, thus giving the foliage a very unorderly appearance; the leaves are therefore, useless for thatching.

### BOTAN AND THATCH LOG PALMS.

The Botan or Guano is a thin, tall Palm, with fan-shaped leaves, found largely in Utilia and Barbareta, and occasionally in the other islands. In Utilia the trunk of the old tree is exclusively used as posts in the construction of "Coconut houses," and "turtle crawls," as it is very durable in the sea-water. The fibre obtained from the leaves is sometimes made into hats, mats, baskets, brooms, and used for thatching.

The Thatch Log or Salt-water Pimento—called Palmito, or Palma de Escoba, by the Ladinios, is another small Palm with fan-shaped leaves and smooth stem. The leaves are locally used for thatching and in making brooms, hats and baskets. The upper part of the stem is soft and spongy, and is occasionally used to stuff pillows, after being sliced into fine flakes. This Palm is also found on the cays off the Mosquito Shore, and in several places on the mainland. The Indians use the hard, durable wood to make handles and bark beaters. *Edouard Conzumius*, 33, Boulevard des Batignolles, Paris.

(To be continued.)

## VEGETABLE GARDEN.

### MAINCROP ONIONS.

THE frosts of February were very beneficial in pulverising the surface soil, a very essential condition for seed-sowing. Advantage should be taken when suitable conditions prevail to sow the maincrop of Onions on ground that has been well-trenched and manured. Do not be in a hurry, as it matters more how the seed is sown than when. Never make an attempt to sow when the soil is sticky, but wait until the ground can be trodden very firmly, and without adhering to the boots.

If obtainable, scatter plenty of burnt refuse over the plot, also give it a liberal dressing of soot before raking it over in readiness to draw out the drills, which should not be too deep. Allow fifteen inches between the rows. Do not sow too thickly. Cover and tread-in the seeds firmly before finally raking over the plot.

### PARSNIPS.

A SOWING of this crop may also be made now, but, unlike the Onion, Parsnips should not be sown on ground that has been recently manured, or the roots will fork.

This vegetable grows best in a fairly heavy soil which has been deeply trenched, well-worked and pulverised. Before sowing the seeds well dress the surface soil with burnt refuse and soot. Sow the seeds thinly in drills made about two inches deep and eighteen inches apart. Place about five seeds in groups at a distance of ten inches apart.

Should roots be required for exhibition, or where it is found difficult to grow this vegetable in the ordinary way, holes should be bored with a suitable iron bar to a depth of three feet to four feet and filled with a finely-sifted compost of loam, burnt earth and sand mixed with a little bone-meal and soot. The compost should be on the dry side when it is placed in the holes, and should be made quite firm. Leave a small depression over the centre of each prepared site, sow four or five seeds at each station, and cover them with compost to the depth of one-and-a-half inch.

When the seedlings commence to grow strongly carefully remove all but the best one. Afterwards keep the plants lightly dusted with old soot and maintain a loose surface tilth by the frequent use of the Dutch hoe. R. H. C.

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

### February Rainfall at Culzean Gardens.

When learning (both by wireless and the newspapers) of the excessive rainfall in the south, I thought it might interest you to know that our rainfall for the month was only 1.65 inch. This was spread over fourteen days, five of which only gave .04 inch or less; the heaviest rainfall in twenty-four hours was on the 3rd, viz., .43 inch. On two previous occasions during the past eight years February has proved a comparatively dry month, viz., in 1921, when only .59 inch was recorded, and again in 1924, when the total was .64 inch, but I do not wish to convey the impression that it is always so, as we have recorded the fact that in February, 1923, the rainfall totalled 4.97 inches, and 1925 was not much less with 4.31 inches. A. T. Harrison.

**Pear Verulam.**—A few days ago, I was presented by Sir James Bruton, a late Mayor of Gloucester and for some years member of Parliament for the City, with a few Pears grown on a tree in his garden. The variety is Verulam, and Sir James informed me that when he went to his present residence, forty-seven years ago, the Pear tree, growing on a wall, was then apparently an old one. The significant fact about it is, however, that never once in the forty-seven years that Sir James has known the tree has it failed to bear. On occasion, the crop has consisted of only a very small number of fruits, but in no single year has Sir James

failed to taste a Pear from this particular tree, and it looks as if it may continue to bear fruit for a long time to come. It would be interesting to know if there are records of any other Pear trees in this country that have produced fruits consistently for so long—the tree I am referring to might have been doing it for years before Sir James Bruton first knew it, nearly half-a-century ago. *G. H. Hollingworth, Gloucester.*

**Sunlight-Ray Lamps in Glasshouses.**—Owing to the dull, sunless weather experienced in the vicinity of the Cheadle Royal Mental Hospital, just outside Manchester, there is some difficulty in the early months of the year in raising seedlings satisfactorily, as they are apt to get drawn, but I have found by experimenting with sunlight-ray lamps a marked difference in seedlings subjected to the rays, over those under control. I am convinced by these experiments that in districts where there is a lack of sunshine, and electric current is readily available, the use of these lamps will be profitable to anyone who has to get produce early, and also, possibly, in other ways. So far, I can only base my experiments on the results of 1927 to date, in raising Tomato seedlings, Cucumbers and Onions, and in each case I am satisfied with the results. Narcissi, picked in the bud, respond very quickly to the rays, and will open in eight hours. Lily-of-the-Valley also, were brought on in the usual way, [and subjected to the rays to open the flowers, which were far better than those from retarded crowns, with wonderful green foliage, which is a big asset, and very fine, stiff stems. A lead-covered cable is run from the main supply along the roofs of the houses, and 500 watt, gas-filled lamps are fixed at intervals, with an X-ray shade, which the makers claim will give the equivalent to 1,500 watts: this I found more satisfactory than 1,500 watt lamps, as the latter gave off a tremendous heat, and raised the temperature of the house too much; the former 500 watt lamp, with shade, does not increase the temperature at three feet from the lamp more than 3° over the ruling temperature of the house. The lamps are controlled by an independent switch to each, and are only used in the day-time; the light is also turned off when the sun shines. When potting off the seedlings the rays were kept on continuously for twenty-four hours with good results, no flagging occurring. *Allan Falconer, Cheadle Royal Gardens, Cheadle, Cheshire.*

**Vita Glass.**—As one of the oldest converts of the new glass which admits the ultra-violet rays of the sun, may I suggest a most useful manner of applying its unique qualities at this season of the year? My wife and I have carried out some simple experiments, comparing the growth under identical conditions of seedlings screened by Vita glass and ordinary glass. The seedlings under Vita glass germinated before the others, and showed a much taller, sturdier growth. This seems to open a field of usefulness in glazing greenhouses where specially valuable plants are being grown or where it is desired to get very early produce, such as Strawberries, for the market. *N. Kerr Russell, M.D., Newcastle.*

**Phyteuma orbiculare.**—I am very much surprised to read on p. 181 that Mr. Arnott's experience of this plant is that it does not like lime in the soil, because it is a native British plant, and is found wild only on chalk downs in the South of England, being quite common in some localities. It may be, of course, that whilst it shows such a decided preference for chalk, it may not relish the burnt variety known as lime. If so, it is an interesting fact and worth noting in the case of other plants.—*C. Nicholson, Hale End.*

**The Leaf-Cutting Bee.**—It would be interesting to know which of our British species the Rev. George Birnie was describing (see p. 155), as there is no such species recognised nowadays as *Megachile rosea*. Probably he referred to *M. centuncularis*—almost the smallest of our eight native species, and the commonest and most widely distributed. It uses many other plants besides Roses, even when the latter are available, and several of our other species also make use of Rose leaves. *C. Nicholson.*

## SOCIETIES.

### HORTICULTURAL CLUB.

THE annual general meeting of the Horticultural Club was held on the 8th inst., at the Trocadero Restaurant, Piccadilly Circus. Mr. Gerald Loder, Chairman of Committee, occupied the chair. After the minutes of the last meeting had been read and confirmed, the Hon. Secretary read the report of the management Committee for 1925-6, from which the following are extracts:

The period covered by the report has been one of quiet waiting and endeavour to keep the Club in being until opportunity afforded to obtain a Club Room, which the Committee recognise is the most pressing need of the members. As one of the objects for which the Club was founded was returning hospitality shown by friends abroad to British horticulturists, your Committee identified the Club with the Entertainment Fund of the Foreign Delegates to the Fédération Horticole Professionnelle Internationale on the occasion of the delegates meeting in this country. The sum of £10 was voted from the Club funds, and with other amounts subscribed by members, brought the total contributions of the Club to £32 12s. 6d.

The resignation of the Hon. Secretary, Mr. Geo. F. Tinley, owing to the pressure of other business, was accepted by your Committee with regret, and he was asked to continue in office until a new Secretary was appointed. The Committee has approached several gentlemen, but, so far, without success, and meanwhile, Mr. Tinley continues to act.

The Committee has pleasure in stating that a series of lectures fixed for the first R.H.S. meetings in January, February, March, April and May have, so far, been attended with great success, and your Committee hopes to arrange an outing in the summer of 1927.

The membership of the Club is 127; very few resignations have been received during the past two years, but several of the members have died, including Mr. R. Pinches, who had served the Club faithfully as a Committeeman for a long number of years.

The adoption of the report was moved by Mr. Loder who stated that the series of dinners and lectures held this spring had been very successful, and there were signs of revived interest in the Club generally. He hoped that Mr. Tinley would reconsider his desire to resign the office of Hon. Secretary, for it was due to his efforts that the recent meetings had been so successful. The great need of the Club was a Club Room, and he hoped that this might be obtained.

The adoption of the report was seconded by Mr. P. R. Barr, the Hon. Treasurer, who gave some particulars of the finances of the Club, which showed a balance in hand of £98 4s. 8d. up to December 31, 1926, and investments amounting to £600.

Mr. Laxton having stated that it was the general wish of the members that Mr. Tinley should be asked to continue the office of Secretary and he hoped he would do so, it was explained that, according to the rules, the Secretary is appointed by the Committee. The adoption of the report and balance sheet was carried unanimously.

The meeting then proceeded to the election of officers. On the proposition of Mr. Loder, seconded by Mr. Darlington, Lord Lambourne was re-elected President, and the vice-Presidents Sir John Llewelyn and Mr. C. E. Shea, were also re-elected. Mr. P. R. Barr was re-appointed hon. treasurer, and the trustees, Mr. H. R. Darlington and Mr. E. Sherwood, were re-elected, and Mr. J. M. Bridgeford appointed to fill a vacancy arising. Mr. George Ingram was re-elected auditor, and Mr. A. Dawkins elected auditor in the place of the late Mr. R. Pinches. The members of Committee were all re-elected, and Mr. A. Dawkins added to fill a vacancy.

### THE LECTURE.

Following the meeting and dinner, at which nearly fifty were present, Mr. F. J. Chittenden gave a lecture entitled, "Some American Impressions." Mr. Chittenden held the keen interest of his audience for some two hours, describing the various places he visited on the occasion of his attending as a delegate from the R.H.S. to the International Conference on Plant Sterility in New York, and at the International Congress of Plant Sciences at Cornell University. He first described his visit to Los Angeles, California, where the climate, he said, was like that of South Europe, so that vegetation was totally different from what we know here. There were fine, wide streets which are lined with Date Palms and Pepper Trees. The most

imposing of all the plants he saw were the Oleanders, which grow ten feet high and some twenty feet through. Bougainvilleas, too, are very glorious. The vegetation on the hills around the town is very scanty, for the forests have been cut down to build houses. In the town itself there were some attempts at gardening, and it seems to be the main recreation of the inhabitants of Los Angeles to sit on their steps in the evenings and syringe water on their little grass plots. In the gardens there are Date Palms, Oleanders, shrubby Hibiscus, and occasionally herbaceous flowers. The next town Mr. Chittenden described was Pasadena, where the gardens are open to the street, and this open condition seems to exist over the whole of the United States. He visited Mr. Theodore Pain's nursery, where there is a fine collection of the native plants of California. He was very interested, he said, to see them growing in tin cans, and there was not a flower pot in the place. Mr. Chittenden said that private gardening, such as we know it, is not practised very extensively in U.S.A., and there are very few American professional gardeners, the gardens being managed by Englishmen, Scotchmen, Frenchmen, Swedes and Italians. Around the Pasadena district are splendid Olive groves and other South European fruits, which are excellently cultivated in the orchards, greatly in contrast to those seen in the Eastern States. He visited the small nursery of the late Mr. Luther Burbank: the largest nursery in the district is that of Mr. Howard Smith, a famous grower of Roses.

From Los Angeles, Mr. Chittenden went north to San Francisco, a very fine city built on undulating ground, and the Park of the Golden Gate is one of the most magnificent public parks he visited. It is built on a sand hill, and he paid a great testimony to the work of Mr. McLaren on the way in which he had laid it out and maintains it. The climate is less tropical than that at Los Angeles, but very mild, as shown by the fine growth of standard Fuchsias, Tree Ferns and other warm exotics. One thing that impressed Mr. Chittenden in the Park of the Golden Gate was the luxuriance of Rhododendrons planted in a mixture of sand and Pine needles. Near San Francisco, at Burlingame, he visited Mr. Frank Cuthbertson, son of Mr. William Cuthbertson, who has made for himself a very nice garden, and he was pleased to notice that his neighbours were trying to do the same. In one big seed-growing farm which he visited near Sacramento, 400 acres are devoted to Asparagus culture, most of it for canning; the stems are cut while white, before they appear above ground. Male Asparagus plants are selected for planting, because it is found that, compared with female plants, the crop is 175 against 100. In this district Pear trees make rapid growth and come into fruit at a very early age, the trees making twelve to fourteen feet of growth in four years. Hundreds of acres of Lettuces are grown for seed, the principal variety being New York, which is similar to our Webb's Wonderful. At Portland, Oregon, which is known as the City of Roses, Mr. Chittenden inspected the Rose trial ground, but was very disappointed with the results.

Travelling north again, he passed through the country explored by Douglas, and reached Seattle on the shores of Puget Sound. This district he described as ideal for the cultivation of bulbs, indeed, from there up to Vancouver Island is some of the finest bulb-growing land he ever saw. When he reached Victoria, Vancouver Island, he said he felt at home, for everybody seemed to have a garden, and there they are enclosed with hedges and well-looked-after. Victoria, he said, was a most delightful city, with a climate something like that of Cornwall. There is an experimental station, twelve to fourteen miles north of the city, and considerable quantities of fruits and vegetables are grown in the district. Most of the gardening is done by Chinamen, who are very successful. The garden at the Victoria Hotel, Vancouver, is, said Mr. Chittenden, exceptionally fine, and the Roses worth going a long way to see. He stated that Dahlias were very popular in this part of Canada, but the varieties are very much inferior to ours,

and he considered that there was a good market for some of our best sorts. He visited Vancouver City where, in the Stanley Park, are many magnificent timber trees with enormous trunks, the remnants of the old forest. Fruit farming is conducted in the dry belt of British Columbia.

In the Okanagan Valley no rain falls for eight months, and the land has to be irrigated three times. Fruit farms average about ten acres and are run by two men. The largest he saw was of thirty acres. Apples, Pears and Peaches are the principal crops grown, the Apples being especially good, almost every fruit being of perfect shape and highly coloured. Mr. Chittenden gave an account of the immense Wheat fields he saw when passing across the prairies; at the time he saw them they were covered with snow, but it was dry snow and did the crop little harm. He stated that the Canadians have an intense love for gardens, and that there are many plants in the Rocky Mountains which are worth introducing to cultivation.

Sir William Lawrence, in proposing a vote of thanks to Mr. Chittenden for his interesting address, thanked the Club on behalf of the guests for a most delightful evening.

### ROYAL HORTICULTURAL.

MARCH 22 AND 23.—The Royal Horticultural Society's Hall was a fairland of colour and fragrance on the above dates, and exhibitors and visitors alike enjoyed the fine exhibits with which the hall was filled, and the beautiful spring-like weather that brightened everything and everybody. Daffodils and Tulips were shown in capital condition, and Mr. P. D. WILLIAMS appeared to create a record by securing five Awards of Merit for new Daffodils, and a recommendation for trial at Wisley for a sixth. Spring flowers of many kinds, from the lowly Viola species and Saxifrages to arborescent Rhododendrons, Camellias, and Acacias provided abundance of interest, while Roses and Orchids contributed their quota to a splendid exhibition.

### Orchid Committee.

Present: Mr. C. J. Lucas (in the Chair), Mr. Gurney Wilson (Hon. Secretary), Mr. R. Brooman White, Mr. Fred J. Hanbury, Mr. Sidney W. Flory, Mr. Arthur Dye, Mr. H. G. Alexander, Mr. Fred K. Sander, Mr. J. E. Shill, Mr. T. Armstrong, Mr. Henry H. Smith, Mr. John C. Cowan, Mr. A. McBean, Mr. J. Wilson Potter, Mr. E. R. Ashton, Mr. Stuart H. Low, and Mr. Charles H. Curtis.

### FIRST CLASS CERTIFICATES.

*Sophro-Laelio-Cattleya Mikado* (S.-L.-C. Prince Hirohita  $\times$  *Cattleya Emperor Frederick*).—A flower of lovely shape and good size; the sepals and petals are soft apricot-coloured, with rose-pink flushing and shading; lip ruby crimson with orange-yellow marks in the throat. Shown by BARON SCHRÖDER (gr. Mr. J. E. Shill), Dell Park, Englefield Green.

*Brasso-Cattleya Mrs. Robert Paterson* var. *Titanic* (B.-C. *Cliftonii magnificum*  $\times$  *C. Clitho*).—A large and handsome flower with very broad sepals and petals of soft purplish mauve colour; lip light purple, margined with mauve and with yellow veining in the throat. Shown by Messrs. BLACK AND FLORY.

### AWARDS OF MERIT.

*Brasso-Laelio-Cattleya Irma* var. *grandiflora* (B.-L.-C. *The Baroness*  $\times$  *L.-C. Golden Queen*).—A large-flowered variety with bold, clear yellow sepals and petals, and a light cerise lip, veined with orange in the throat. Shown by BARON BRUNO SCHRÖDER.

*Laelio-Cattleya General Maude* var. *Victory* (C. *Harlyana*  $\times$  *L.-C. Rubens*).—A fine Orchid both in shape, texture and colour. The sepals and petals are rich purplish-rose; lip of similar colour at the base, but the widespread apex is royal purple and the throat is veined with golden yellow. Shown by Messrs. STUART LOW AND CO.

*Odontoglossum Trident* var. *rubrum* (*eximium*  $\times$  *King Alfred*).—A shapely and deeply-hued *Odontoglossum*; the sepals and petals are bright

chocolate-red, with purplish-mauve markings on the blush tips. Lip white, with a broken central area of deep brown, and golden crest. Shown by Messrs. CHARLESWORTH AND CO.

*Odontoglossum crispum*-Solon var. *Perfection*.—A handsome form with deep chocolate-red markings and blush-white margins to the sepals, petals and lip. Shown by Mr. J. J. BOLTON, Claygate Lodge, Claygate, Surrey.

*Odontoglossum plumptonense* var. *Senator* (*amabile splendens*  $\times$  *Lambeauium*).—This large-flowered variety is of light purplish-mauve colour, with the apices of the segments pure white, and white markings on the deeper colour. Lip mauve, with orange-brown base. Shown by Mr. F. J. HANBURY, Brockhurst, East Grinstead.

### GROUPS.

The green and black *Coelogyne pandurata* was finely shown by Messrs. CHARLESWORTH AND CO., one spike carrying fourteen flowers; *Odontoglossums*—O. c. *xanthotes*, O. Rowena, O. Rosina, O. Clonius and O. *plumptonense*, were charmingly shown, while *Miltonia Kenneth*, M. *Lycæna*, *Lycaste cruenta*, the copper-coloured *Odontodia muralis* and *Cypripedium niveum* were other interesting subjects.

Messrs. SANDERS again made a brave show, with *Cymbidiums* as their chief subjects. Among these we were attracted by C. *brugense* var. *Rose Marie*, a C. *Ceres* form of deep rose-pink colouring; C. *Moth*, with heavy brown markings on the lip; C. *Louis Sander*, of particularly deep rose colouring, and C. *Pauwelsii* var. *Daffodil*, of clear greenish yellow. Other notable plants in this large group were *Angraecum sesquipedale*, the lovely *Phalaenopsis amabilis*, *Maedevallia Gargantua*, the quaint little *Dendrobium tetragonum* and *Cattleya citrina*.

Messrs. COWAN AND CO. contributed some capital *Cymbidiums*, notably C. *Dotterel*, C. *Erica* and C. *Pauwelsii*; with these were *Dendrobium thrysiflorum*, *Brasso-Cattleya Shilliana*, *Cattleya Titius*, *Odontodia Henryi*, very fine; O. *Mira*, *Lycaste cruenta*, and the old *Coelia Baueriana*.

Messrs. STUART LOW AND CO.'s exhibit contained good examples of *Brasso-Laelio-Cattleya Baroness*, *Phalaenopsis Schilleriana*, P. *Stuartiana*, *Brasso-Cattleya Cliftonii magnifica*, *Dendrobium Thwaitesiae*, Veitch's var., D. *Brymerianum*, and many excellent *Cymbidiums*.

Mr. HARRY DIXON exhibited *Cymbidiums* and *Odontoglossums*. Messrs. FLORY AND BLACK sent varieties of the handsome *Brasso-Cattleya Mrs. Robert Paterson*, *Sophro-Cattleya Heatherwood*, and S.-C. *Vulcan*, with rich ruby-coloured lip. Messrs. H. G. ALEXANDER, LTD., showed beautiful plants of *Laelio-Cattleya Queen Mary* var. *Radiance*, *Brasso-Laelio-Cattleya Caligula* var. *Excelsa*, B.-L.-C. *Golden Horn*, *Cymbidium Letty* (*Gottianum*  $\times$  *Merlin*) and C. *Ladybird*, the last green, brown and white.

*Sophro-Laelio-Cattleya Mikado*, buff, pink and ruby, of lovely form, was shown by BARON BRUNO SCHRÖDER (gr. Mr. J. E. Shill), Dell Park, Englefield Green, who also showed B.-L.-C. *Irma grandiflora*, of large size and with golden sepals and petals.

### Floral Committee.

Present: Section A.—Mr. Henry B. May (in the chair), Mr. J. F. McLeod, Mr. Arthur Turner, Mrs. Ethel M. Wightman, Mr. William Howe, Mr. H. J. Jones, Mr. G. W. Leak, Mr. Charles E. Pearson, Mr. D. Ingamells, Mr. J. M. Bridgeford, Mr. Montagu M. Allwood, Mr. E. R. Janes, Mr. R. Findlay, Mr. W. H. Page, Mr. A. E. Vasey, Mr. George Churcher, Mr. James B. Riding, Mr. J. T. West, Mr. W. B. Gingell, Mr. D. B. Crane, Mrs. Helen Lindsay Smith and Mr. H. R. Darlington.

Section B.—Mr. Gerald W. E. Loder (in the chair), Mr. W. J. Bean, Mr. E. A. Bowles, Mr. R. C. Notcutt, Mr. Mark Fenwick, Mr. F. G. Preston, Mr. W. B. Cranfield, Mr. E. H. Wilding, Mr. Reginald Cory, Mr. A. Bedford, Mr. L. R. Russell, Mr. R. D. Trotter, Mr. G. Yeld, Mr. T. Hay, the Hon. Henry D. McLaren, Mr. Clarence Elliott, Mr. Charles T. Musgrave and Mr. S. J. Lucas.

### AWARDS OF MERIT.

*Caltha palustris alba*.—A white form of the well-known yellow Marsh Marigold which beautifies many of our streams. It does not appear to be quite so vigorous as the species, but it is a desirable waterside plant. Shown by Mrs. W. D. GARRETT-BOTFIELD, Beamish, Albrighton, Shropshire.

*Magnolia salicifolia*.—This Japanese, deciduous species forms a small, graceful tree up to about twenty feet in height. The pure white flowers are somewhat suggestive of those of M. *stellata* (M. *Halleana*) when first opening, but are larger and the petals have more substance. The flowers are borne on naked wood, but the leaves are narrowly ovate-lanceolate, green above and slightly glaucous beneath. Shown by LIONEL DE ROTHSCHILD, Esq. (gr. Mr. A. Bedford), Exbury, Southampton.

*Primula Runnymede Gem*.—To all garden intents and purposes, this is a double-flowered *Primula malacoides*. It is said to have been derived from P. *malacoides* fl. pl.  $\times$  P. *sinensis* fl. pl. The somewhat woolly foliage is sharply serrated. The habit is rather squat and the double, bright mauve flowers are freely borne in dense whorls. Shown by Capt. SYMONS-JEUNE, Runnymede House, Old Windsor.

*Rehmannia hybrida alba*.—The parentage of this attractive greenhouse plant was given as "R. *angulata*  $\times$  *rupestris*?" In general appearance it is much like *Rehmannia kewensis*, with slightly larger flowers and more space between the nodes. The flowers are white, with lemon-coloured tubes.—Shown by Sir WILLIAM LAWRENCE, Burford Lodge, Dorking.

*Rhododendron hippophaeoides*.—This useful little species was discovered by Forrest in Yunnan, in 1913, where it is widely distributed at fairly high altitudes. It belongs to the *Lapponicum* series. It makes a neat floriferous shrub from two feet to four feet in height, well-clothed with lavender-blue and bluish-rose flowers. Shown by LADY ABERCONWAY and the Hon. HENRY D. McLAREN (gr. Mr. J. Puddle), Bodnant, N. Wales.

*Rhododendron (Azalea) Kurume Kirin*.—This is a very attractive Japanese Azalea. It makes a neat, erect, little, evergreen bush, bearing plentiful hose-in-hose flowers of a fascinating soft salmon shade of colour. Shown by Messrs. ROBERT VEITCH AND SONS.

*Rhododendron virgatum*.—Although discovered by Hooker in Sikkim and Bhutan, in 1849, the plant shown was collected more recently by Capt. F. Kingdon Ward in Thibet, and numbered 6,279. It is a dwarf, erect, evergreen species, bearing relatively large flowers. They are about two inches across, of blush-rose colour, and borne singly in the axils of the leaves in sufficient numbers to give the appearance of an elongated truss. The dark green leaves, which average one-and-a-half inch in length, are nearly lanceolate, and sage-green below. Shown by Lt.-Col. L. C. R. MESSEL, O.B.E. (gr. Mr. J. Coomber), Nymans, Staplefield.

*Saxifraga Coombe White*.—This very desirable alpine is a seedling from S. *Rocheliana*. It makes a neat, compact, little plant, with much of S. *Burseriana* habit, bearing large, substantial pure white flowers on sturdy stalks. Shown by FRANK LLOYD, Esq. (gr. Mr. M. A. Mills), Coombe House, Croydon.

### FOR TRIAL AT WISLEY.

*Freesia R. F. Felton*.—This is a good variety of the coloured *Freesias* of which there is now a goodly selection. The flowers are large, rounded and of rich orange colour with deeper markings where the segments overlap. Shown by Mr. G. H. DALRYMPLE.

### GROUPS.

Forced shrubs were the subjects of several very attractive collections. Just inside the entrance, Messrs. L. R. RUSSELL, LTD., had a very pretty group of *Clematis*, in many good varieties, *Wistarias*, *Laburnums*, *Viburnums*, *Pyruces* and *Azaleas*, both A. *indica* varieties and A. *mollis*  $\times$  *sinensis* forms. On the opposite side of the entrance, Messrs. J. CHEAL AND SONS

gave special prominence to well-flowered bushes of *Rhododendron* Pink Pearl, flanked by standard *Cytisuses*, *Wistarias*, *Azaleas* and *Polyantha* Roses.

At the back of their well-arranged sandstone rock garden, Messrs. WILLIAM CUTBUSH AND SON successfully grouped a quantity of *Lilacs*, *Wistarias*, *Forsythias* and various floriferous *Azaleas*. In the rock garden they planted breadths of *Muscari botryoides album*, Dog's-tooth *Violets*, *Tulipa praestans*, *Tubergen's* var. and *Primulas*.

*Pyruses* of many useful varieties were well shown by Messrs. HILLIER AND SONS, who also had good examples of *Euonymus fimbriatus* bearing very attractive, purplish young leaves, many *Lilacs*, *Osmanthus Delavayi* and *Azaleas*.

A large exhibit of *Azalea mollis* × *sinensis* in distinct varieties, set up by Messrs. R. and G. CUTHBERT, provided a splendid mass of glowing colours.

Various uncommon and not generally hardy shrubs added greatly to the interest of the show. Messrs. ROBERT VEITCH AND SON had good specimens of the fragrant *Boronia megastigma*, and the more robust, pink-flowered *B. heterophylla*, *Viburnum Carlesii*, *Diosma cordata alba*, *D. c. purpurea*, *Kennedy ovata purpurea* and other species, with such *Rhododendrons* as *R. sutchuenense*, *R. cilicalyx roseum*, *R. luteum* and *R. Veitchianum*.

The chief *Rhododendrons* shown by Messrs. R. GILL AND SON were brilliant trusses of *R. Cornubia*, *R. Bernard Gill* and *R. H. T. Gill*, with a goodly pot plant of *R. cilicalyx*. They also had plentiful sprays of *Pieris* (*Andromeda*) *japonica*, *Magnolia Campbellii*, *M. conspicua*, *Daphne Genkwa* and a selection of a good strain of *St. Brigid Anemones*. Messrs. REAMSBOTTOM AND CO. also exhibited their well-known strains of *St. Brigid Anemones*.

*Rhododendron Thomsonii grandiflorum*, *R. arboreum*, *R. a. Kermesianum*, *R. barbatum*, *R. spinuliferum* and other good *Rhododendrons* were set up by Mr. G. REUTHE, who also showed *Corylus pauciflora*, *Daphne odora*, *Coronilla valentina* and a selection of alpine and border flowers. Messrs. BAKERS LTD. had an attractive group of Japanese Cherries, *Viburnum Carlesii*, Brooms, *Wistarias* and *Dicentra* (*Dielytra*) *spectabilis*.

Lt.-Col. L. C. R. MESSEL, O.B.E. (gr., Mr. J. Coomber), Nymans, Staplefield, contributed an interesting collection of shrubs, which included *Pieris japonica*, *Forsythia spectabilis*, *Acacia Baileyana*, *Prunus pissardii* var. *Hessei*, *Rhododendron lutescens* and *R. oreodoxa*.

On the special table, G. W. BLATHWAYTE, Esq., West Porlock House, Taunton, exhibited well-flowered sprays of *Acacia Baileyana*, *A. falcata* and *A. dealbata*, grown entirely in the open.

Exceedingly well-flowered branches of *Pieris floribunda* were associated with a good selection of alpine and Hyacinths by Messrs. STEWART AND SON.

Many profusely-flowered branches of the yellow Banksian Rose, Fortune's Yellow, Austrian Copper and Austrian Yellow Roses, were shown by Mr. G. PRINCE, while Mr. ELISHA J. HICKS set up vases of such H.T. Roses as Climbing Lady Hillingdon, Mrs. Elisha J. Hicks, Madame Edouard Herriot and Souvenir de C. Pernet.

Messrs. SUTTON AND SONS contributed a tasteful group of well-flowered hybrid *Cinerarias*, and their new double-flowered Wall-flowers. The latter possessed large spikes of fragrant orange and yellow flowers.

Carnations of good quality were staged by Messrs. ALLWOOD BROS., Messrs. C. ENGELMANN, LTD., and Messrs. STUART LOW AND CO., and the last-named also showed *Camellias*, *Acacias*, and *Boronia megastigma*.

There were many exhibits of rock gardens. Mr. F. G. WOOD planted various *Primroses*, *Saxifrages* and *Azalea Hinomanyo*. The Misses HOPKINS also used *Primulas* and *Saxifrages* effectively. *Anemone fulgens* provided bright colour in the rock garden of Messrs. W. H. ROGERS AND SON, who also planted *Soldanella montana* and various *Primulas*.

In a boldly disposed rock garden, Mr. CLARENCE ELLIOTT had sweeps of *Saxifraga oppositifolia splendens*, *S. Grisebachii*, Wisley

var., of great vigour and beauty, and *S. Mira*. Messrs. TUCKERS, LTD., had good batches of *Saxifraga Sundermanniana*, *S. eudoxiana*, and *S. apiculata*. Messrs. MAXWELL AND BEALE used *Ericas*, *Primulas* and various *Saxifrages* in their rock garden. *Saxifraga* (*Megasea*) *ligulata Strachyi* was prominent in the rock garden of Messrs. M. PRICHARD AND SON, who also had *Daphne Cneorum* and other alpine. Messrs. WM. WOOD AND SON displayed Japanese *Azaleas*, *Saxifrages* and *Primulas*.

*Spiraea confusa*, *Viburnum Carlesii* and *Prunus triloba* fl. pl. made a good background to the alpine shown by Messrs. HODSONS, LTD. Messrs. WATERER, SONS AND CRISP had a good batch of *Tulipa praestans*, with several *Saxifrages* and *Primulas*.

Large numbers of *Polyanthuses* and *Primroses* of considerable interest and beauty were set up by Mr. G. W. MILLER. Mr. J. J. KETTLE, Miss E. HEATHCOTE and Mr. B. PINNEY showed fresh and fragrant *Violets*.

A large selection of *Freeseias*, staged by Mr. G. H. DALRYMPLE included the varieties *Wistaria*, *Buttercup* and *Glowing Embers*.

#### Narcissus and Tulip Committee.

Present: Mr. E. A. Bowles (in the chair), Mr. P. D. Williams, Mr. E. Hawker, Mr. P. R. Barr, Mr. Charles H. Curtis, Mr. W. B. Cranfield, Mr. J. D. Pearson, Mr. F. Secrett, Mr. Herbert Chapman, Mr. Alfred W. White, Mr. Herbert Smith, Mr. J. Jones, Mr. W. Poupart, Mr. C. W. Needham, Mr. G. W. Leak, Mr. G. Churcher, Mr. F. Barchard, Mr. J. S. Arkwright, Miss E. Willmott and Mr. A. Simmonds (Secretary).

#### AWARDS OF MERIT.

*Narcissus Godolphin* (Ia).—A glorious, large, deep golden-yellow flower, with frilled trumpet and firm texture. Stems about twenty inches long. Shown by Mr. P. D. WILLIAMS, Lanarth, Cornwall.

*N. Havelock* (IIa).—A beautiful incomparabilis variety, with wide and even perianth segments and finely proportioned trumpet, all of the same clear yellow colouring, but with a deeper shade in the trumpet. Shown by Mr. P. D. WILLIAMS.

*N. Lanarth* (VII).—A handsome, deep golden Daffodil of modest size and fine shape; of Jonquil descent. Shown by Mr. P. D. WILLIAMS.

*N. Penelevy* (IVa).—A dainty Leedsii variety, with white perianth segments of fine substance, and a short trumpet of cream colour, with a golden frill. Shown by Mr. P. D. WILLIAMS.

*N. Tregosse*.—An exquisite incomparabilis variety, large-flowered, bold and attractive. Perianth segments soft yellow; trumpet, deep orange, almost scarlet, and frilled. Exhibited for show purposes. Shown by Mr. P. D. WILLIAMS.

#### FOR TRIAL AT WISLEY.

*N. Trevithian*.—A Jonquilla Daffodil bearing several golden flowers on short stems. Selected for trial at Wisley. Shown by Mr. P. D. WILLIAMS.

#### GROUPS.

There was a greatly increased number of collections of *Narcissi* staged. Messrs. BARR AND SONS had an extensive exhibit of exceedingly good varieties. It was a very comprehensive collection, though perhaps the large Trumpet varieties predominated, and of these we especially admired the rich colours of *Tasse d'Or*, *Siegfried*, *Bardolph*, *Sungold*, *Royal Gold* and *Aerolite*. In addition to the above there was a fascinating selection of seedlings of the showy Ajax type, while *Sunrise* of lovely colouring, *Orange Sceptre*, which has a large, bright corona, and *Messina*, with a narrow, vivid corona, of the Barri Daffodils, and *Nightingale*, a shapely *Poeticus*, were very beautiful.

Messrs. J. R. PEARSON AND SONS set up an admirable collection near the gallery. Their flowers were characterised by good size, shapeliness and substance. *Firetail*, *Poeticus*, *Van Waveren's Giant*, *King Alfred*, *Cleopatra* and *Lord Roberts*, large Trumpet varieties, *Evangeline* and *Hera*, chaste Leedsii forms, *Altna*, a large Double, and *Zillah*, are the names of only a few of the many good sorts.

The collection of Mr. J. W. BARR was worthy of admiration, but it suffered in value of account of the system of labelling, which did not permit the names being read easily. No doubt the long journey did not permit sufficient margin of time for the adoption of the conventional method. There were many good sorts on view, especially *Great Dane* and *Royal Gold*, of the large Trumpets, *Loch Tyne*, a beautiful Leedsii, and *Flame*, a brilliant Barrii variety.

In a corner group, Messrs. CARTWRIGHT AND GOODWIN displayed a goodly collection which included *Cleopatra*, *Frostbound*, *St. Vincent*, *Weardale Perfection* and *King Alfred*, with large Trumpets, and *Elvira*, a *Poetaz* form. Messrs. HEWITTS, LTD., interspersed vases of *Narcissus Spring Glory*, a good bicolor Trumpet, and *Sacrifice*, a shapely *Poeticus*, with vases of *Delphinium* spikes. Near the Orchids, Mr. J. L. RICHARDSON massed vases of *Narcissus Glorious* (Barrii), *Fortune*, a large *Incomparabilis*, with a rich corona, *Golden Prophet*, a yellow Trumpet of rich colour, and *Golden Chariot*, a Trumpet Daffodil of great size. He also staged several very good seedling Trumpet varieties.

A splendid collection of Tulips growing in bowls of fibre, was arranged by Messrs. R. H. BATH, LTD. The chief varieties were *Clara Butt*, *Le Notre*, *Pride of Haarlem*, *Andromache*, *Empress of China* and *Gesneriana lutea*. They also exhibited masses of Dutch Iris, *Chionodoxa Luciliae* and some very floriferous *Primroses*.

Messrs. J. CARTER AND CO. had an attractive exhibit of early Dutch Tulips and *Lachenalia*s. The latter were excellent selections of *Whitewell Seedlings*. The Tulips were arranged in circles of distinct colours. The principal varieties were *Electra*, *Murillo*, *Schoonord*, *Reve d'Or* and *Peach Blossom*. Adjoining his *Polyanthuses* and *Primroses*, Mr. G. W. MILLER had a collection of Darwin Tulips, *Pheasant's Eye* *Narcissus* and *Chionodoxa Luciliae*. The chief Tulips were *William Copland*, *William Pitt*, *Princess Elizabeth* and *Cramoise Brilliant*.

#### Fruit and Vegetable Committee.

Present: Mr. C. G. A. Nix (in the chair), Mr. W. Poupart, Mr. P. C. M. Veitch, Mr. G. F. Tinley, Mr. T. Pateman, Mr. J. Wilson, Mr. E. Laxton, Mr. A. Bullock, Mr. W. Giles, Mr. F. Jordan, Mr. E. Beckett, Mr. A. Metcalfe, Mr. J. Cheal, Mr. A. Poupart, Mr. H. Prince, Mr. H. Markham, Mr. J. Harrison, Mr. W. H. Divers, Mr. W. Lobjoit, Mr. H. V. Taylor and Mr. A. N. Rawes (Secretary).

The only exhibit before this Committee was a new Apple named *King George V*. It was raised by Lady Thorneycroft and shown by Messrs. J. CHEAL AND SONS. It was a very attractive looking fruit, something after the style of *Cox's Orange Pippin*, with a pale yellow skin covered almost entirely with bright red and a few crimson stripes. The flesh is solid and of agreeable flavour. It was recommended that the variety be included in the trial of commercial Apples at Wisley.

#### GUILDFORD AND DISTRICT GARDENERS'

A successful series of winter lectures was brought to a close on March 14, when Mr. A. E. Burgess, Horticultural Superintendent to the Surrey County Council, visited Guildford and gave a lecture on "How Plants Grow."

By way of preface, Mr. Burgess said he had watched the progress of the Guildford Association with very great interest, and he was glad to meet professional gardeners who were never tired of discussing the methods of cultivation. Ninety-nine per cent. of his lectures were on practical matters; but it was an added pleasure that for this occasion the Association had asked him to speak on a scientific phase of horticulture, although his subject would have practical bearings as well. The talk that then followed held his audience in close attention, as he explained some of the marvels of plant life—the cell unit, and the building up of a plant; life, development and decay, in the process of which provision is always made for carrying

on the next generation. "Plants are living things, and must pass through the stages of breathing, feeding, multiplying and decay." As the lecturer dealt with the functions of plants by night and by day, the part played by hair-roots, feeding and the work of the leaves, the subject became full of romance and wonder.

In speaking to a vote of thanks, the President, Alderman W. T. Patrick, J.P., said one could but feel that we are all parts of a universal plan, and that behind these marvels of creation there must be a Creator. Mr. Stedman said it was a pleasure to see so many of the younger men present, and a lecture such as they had heard should turn their thoughts into right channels of study; he hoped they would read and follow up the subject for themselves. Mr. Burgess had placed them under a great obligation in giving a lecture of such educational value, yet, with the fascination of a fairy tale.

Having concluded the winter session, the Committee is arranging a series of summer visits to famous gardens in Surrey: Sir Jeremiah Colman's, at Gatton Park; Lady Methuen's, at Haslemere; Mr. J. J. Joicey's, at The Hill, Witley; Mr. T. Pim's, at Snowdenham Hall, Bramley; The R.H.S. Gardens, Wisley; and others.

An enjoyable social gathering was held on Wednesday, March 16. The hall had been made beautiful by decorations of evergreens, flowers and pot plants lent for the occasion. Soon after 7.30 members and friends assembled, about two hundred being present. All the arrangements were entered into with hearty enjoyment; they included whist, dancing, games, instrumental and vocal music, competitions and refreshments. In a guessing competition, Mrs. Fletcher established a record by guessing exactly the weight of a cake and of a pail of sweets.

During an interval Mr. Patrick made a brief and cheery speech, explaining the work and aims of the Association, and appealing to every one to rally round the Show Secretary, and work for a successful exhibition in July.

## Obituary.

**H. T. Pitt.**—By the death of Mr. H. T. Pitt, of Rosslyn, Stamford Hill, early on March 16, the horticultural world has lost a remarkable man, and the Orchid trade a generous patron. Many years have passed since Mr. Pitt became seriously interested in Orchids, and at that time the Stamford Hill district was not so densely populated as now. Notwithstanding the many difficulties attaching to the cultivation of Orchids in London, Mr. Pitt steadily added to his collection and maintained many of his plants in good health from the time he commenced to grow Orchids down to the time of his death. In conjunction with Mr. Thurgood, his capable gardener, he raised many hybrids, and the manner in which he continuously exhibited flowering plants of *Epidendrum Endresii-Wallisi* was a subject of frequent comment among Orchid specialists. Mr. Pitt spent large sums of money in acquiring rare species, fine varieties and choice hybrids, and several years ago he paid unusually high prices for exceptionally good *Odontoglossums*. His collection was an extensive one, and invariably interesting, as he had catholic tastes and did not specialise in any one family of Orchid. Many rare species, some small and quaint, others large-flowered and beautiful, were preserved in excellent health year after year at Rosslyn. Mr. Pitt occasionally offended people by his blunt outspokenness in regard to the merits of a particular Orchid, but any brusqueness of manner was forgotten in his generous praise of plants that appealed to him. He was a member of the Royal Horticultural Society's Orchid Committee, large-hearted, generous in an unostentatious way, a hard-worker, an important personality in the wholesale meat trade, and one who never suffered fools gladly. The funeral took place on Monday last, when there were numerous floral evidences of the high regard in which the deceased gentleman was held, including a superb design in Orchids from Messrs. Charlesworth and Co., in whose business Mr. Pitt took a special interest.

## NEW INVENTION.

### THE HAMPSON SHOULDER HOE.

NEVER before has the need of labour-saving appliances been so imperative as in these days of relatively high wages, and any device that will lessen the costs of production and render work easier and quicker, is assured of a ready welcome in any industry. Horticulture is no exception to the rule, but it is not an easy matter to invent a cultivating tool that is valuable to both the commercial grower, who cultivates large acreages, and the private gardener, whose crops are grown on a more moderate scale. But Mr. John Hampson, who in addition to having cultivated crops on a large scale, possesses an inventive mind and considerable engineering skill, has successfully applied himself to the task of speeding up the universal work of hoeing

FIG. 110.—THE SHOULDER HOE.

the ground. The idea of his Shoulder Hoe, like all great ideas, is simplicity itself, with the addition of a certain amount of applied science.

As will be seen from the illustration (Fig. 110), this new invention is in the form of an adjustable cultivator with an extended handle resting on the shoulder, and the operator walks backwards. The act of walking, with the natural leverage caused by holding the cross handle, provides all the energy required, and the hoeing is done at an immensely quicker rate than by using any of the ordinary types of hoe. The work is done better, because the hoed surface is not trodden on, and fatigue is considerably lessened. With the Shoulder Hoe is supplied interchangeable straight hoes of four different sizes.

The implement and its various parts all appear to be strong, light and exceedingly well made. The steel tube, being Sheridised, is rust-proof.

## ANSWERS TO CORRESPONDENTS.

**BRUSSELS SPROUT LEAVES WITH CIRCULAR SPOTS.**—S. A. The disease is known as Ring Spot of Brassicas and is caused by the presence of a fungus named *Mycosphaerella brassicola*. This disease, however, seldom causes material damage, and is probably at its worst during a wet season, especially if the Brussels Sprouts are planted in heavily manured ground.

**DOUBLE-SPATHED RICHARDIA.**—Head Gardener. In large collections of well-grown *Richardias* it is a fairly common experience to find occasional stems bearing duplicate spathes.

**GARDENERS' ILLNESS AND STATE INSURANCE.**—G. D. The point does not appear to have come before the Courts, but if you have been receiving your full wages during illness, it is only reasonable that your employer should receive the amount paid in respect of the State Insurance.

**HOLLY SEEDS.**—K. Y. Holly berries should be mixed with sand and stored in a cool shed for sowing next autumn, or they may be slightly beaten and the pulp washed from the seeds, and then sown out-of-doors at once. They germinate irregularly; some at the end of a year, others in two years from sowing; and some may lie dormant even three years. A percentage of yellow-berried Hollies come true from seeds, but the majority of the plants do not produce yellow berries.

**NAMES OF PLANTS.**—E. G. 1, *Codiaeum* (Croton) *Emperor Alexander III*; 2, *C. Mortii*; 3, *C. Eugene Draps*; 4, *C. Count Hugo*; 5, *C. Inimitabilis*; 6, *C. Davisii*; 7, *C. Baron James de Rothschild*; 8, *C. Victoria superba*; 9, *Cypripedium*, probably a hybrid of *C. Druryanum*; 10, *Cymbidium Lowianum*; 11, *Ruellia Portellae*; 12, *Zebrina* (*Tradescantia*) *pendula*.

**NON-POISONOUS WEED KILLER.**—E. M. D. An effective non-poisonous weed-killer is made and offered by Messrs. Cooper, McDougal and Robertson, Ltd., Berkhamsted, Herts. It is in liquid form and free from arsenic. Ask for the non-poisonous weed-killer, with instructions for its use as to quantity in proportion to water. The firm generally recommends one pint to two-and-a-half gallons of water, or one part weed killer to twenty parts of water. The weed-killer should be used in dry weather, and appears likely to last for two days at least to give the weed-killer proper time to act. Should it rain immediately after the liquid is applied it would mean that it becomes too diluted to be effective.

**TREES TO PLANT IN MAY.**—G. H. S. At so late a time as the middle of May, we think your best chances of successful planting would be with Conifers, which may be obtained in pots from most reputable nurserymen, and of these we suggest the following as being suitable for the position: the common Silver Fir and the Spruce, Scots Pine, *Pinus Laricio*, *Cedrus Deodara* and the English Yew. If other types are required the Holly, Turkey Oak, the London Plane and *Robinia Pseudacacia* would be the most likely to succeed. The best Cypress would be *Cupressus Lawsoniana*, though we should prefer *Juniperus chinensis* as an alternative tree of somewhat similar type. Whatever tree, or trees, you select it would be essential to give them considerable attention during the remainder of the year until the autumn rains fall. It would be well to provide a screen around each tree for a time, and to spray the stems and foliage towards the end of every warm day.

**VIOLETS UNSATISFACTORY.**—A. B. We could find no trace of fungous disease, although some amount of *Botrytis* was present. The plants have evidently been grown too closely together, and their present condition is due to crowding and the unsuitable position of the frame.

**Communications Received.**—H. H.—C. G.—T. L.—C. and C.—W. A.—A. W.—E. S. S.—E. E. T.—T. P.—H. A. S.—T. S. C.

REMARKS.—Supplies show a considerable increase and prices are on the down grade. The improved weather has resulted in an ample supply of red Richmond Roses

which are very fine in quality. Other varieties now available are: Madame Butterfly, Golden Ophelia, Pink Ophelia, and Mrs. Aaron Ward. The quantities of Carnations now exceed the demand, and the prices fluctuate according to the quality. Irises are much improved in quality; supplies are increasing almost daily, and with falling prices there should be more demand for these flowers. Richardias (Arums) and Lilium longiflorum (formosum type) remain at a very low price. Sweet Peas, from home-growers, are the newest subject in this department, and they are fairly good in quality. There is still a glut of single Violets Princess of Wales. Trade shows a little improvement in the pot plant department. Flowering plants are now receiving more attention, and the fine quality, generally, calls for better demand, especially for Azaleas, Cyclamens, Genistas, Spiraeas, Mignonette and some fine pot-grown Rhododendrons.

REMARKS.—All departments of the market have reported more active conditions. Fruits from South Africa remain the leading feature, this week's consignments being particularly heavy, and including Peaches, Nectarines, Pears, Plums, Grapes and Pines. American and Canadian Apples are a shade better trade, although, so far as the few English Apples available are concerned, there is no demand except for first grade fruits of Bramley's Seedling. A few hothouse Grapes are arriving from Belgium, but their values are lower. Forced Strawberries are available but very dear. The few Tomatoes received from the Worthing district are selling well. Cucumbers are becoming more plentiful each day, but the tone is good and prices firm. Forced Rhubarb has improved in value in spite of larger supplies of natural Rhubarb. Forced Beans are more plentiful and quotations are easier. New Potatoes from Guernsey are selling well at improved prices, but new Potatoes from Algeria will probably affect their prices. French Asparagus is a firm trade in spite of increasing supplies. Cauliflowers, which have been very cheap, are inclined to be better trade. The Mushroom section has been affected by largely increased supplies, and values are lower. French Lettuce are dearer although quantities are fairly heavy, the fine weather being favourable to a firm demand. Old Potato trade remains steady, with a demand for best sorts only.

## GLASGOW.

Although price movements displayed a little irregularity the tone of the cut flower market was rather better during the past week. All the Daffodil supplies were grown out-of-doors and values were mostly in favour of buyers,

Golden Spur and princeps being worth 2 to 3/- per doz. bunches; King Alfred, 6/- to 9/-; Emperor, 4/- to 8/-; ornatus, 6/- to 8/-; and Narcissi, 2/- to 4/-; Tulips continue to be fairly plentiful and commanded the following prices: Madame Krelage, 10d. to 1 1/2 per bunch; double red, 1 1/4 to 1 1/2; double yellow, 1 1/4 to 1 1/2; Lulsante and Couronne d'Or, 10d. to 1 1/2; White Hawk and William Copland, 1/- to 1 1/2; Lucetta, 10d. to 1 1/2; Tea Rose, 8d. to 1 1/2; Stanley, Bartigon and Flamingo, 10d. to 1/-; Muriello and Prince of Austria, 8d. to 10d.; and La Reve, 7d. to 1/-; Prices of Yellow Irises fluctuated between 3/- and 4/- per dozen; and Wedgwood sold at 3 1/2 to 4/-; Richmond Roses made 4/- to 6/- per dozen; Carnations, 4/- to 5/- per dozen; Lilac, 1 1/2 to 1 1/2 per bunch; Richardias, 4/- to 6/-; Lilium longiflorum (Harrisii), 6/-; Lily-of-the-Valley, 2 1/2 to 3/-; Asparagus, 9d. to 1 1/2; Anemones, 4/- to 6/- per dozen, and Violets, 6d.

In the fruit market, Oranges increased further in value. Valencia 300's to 21/- to 24/- per case; 360's, 17/- to 20/-; 240's, 23/- to 25/-; 420's, 26/- to 28/-; 714's, 28/- to 30/-; Jaffa 144's, 22/-; 240's and 180's, 24/-; The value of Porto Rico Grape Fruit varied from 20/- to 23/-; Apples, on the other hand are cheaper. Winesap extra fancy being 14/- per case; fancy, 11/- to 13/-; Newtown, 13 1/2 to 15/-; Ben Davis, 16/- to 23/- per barrel; Baldwin and York Imperial, 18/- to 22/-; South African fruit also declined in value, especially yellow-flesh Peaches, which were sold at 3/- to 4/- per tray and freestone at 5/- to 6/-. The prices of white Grapes were steady at 10/- to 14/-.

Any changes in the prices of vegetables were in a downward direction. Dutch Lettuce, 30's, realised 6 1/2 to 7 1/2; French 24's, 6/- to 8/-; Cauliflowers, 6/- to 7/- per crate; Endive, 3/- to 3 1/2; Radishes, 3/- to 3 1/2 per dozen bunches; Mushrooms, 1 1/2 to 2/- per lb.; Chicory, 4d. to 5d.; Madeira Beans, 3 1/2 to 4/- per box; Dutch Cucumbers, 6d. to 10d.; English Cucumbers, 10d. to 1 1/2; Rhubarb, 32/- to 34/- per cwt.; round Carrots, 6d. per bunch; and long Carrots, 10d. to 1/-.

## TRADE NOTE.

For the South Lincolnshire flower traffic, the London, Midland and Scottish Railway is putting on a new type of brake van, with steel roof and concrete flooring, electric lighting, special heating apparatus, and corridor doors. Each van is capable of carrying five tons of flowers, is fifty feet long, and mounted on four pairs of wheels. The flower freightage from the L.M.S. depot at Spalding has already exceeded that of the corresponding weeks of last year's forced-bloom season, and it is expected that a train of ten new brake vans will be available at Spalding to cope with the special Easter traffic.

## SCHEDULES RECEIVED.

BATH AND DISTRICT HORTICULTURAL SOCIETY.—Show to be held on July 8 and 9, in the Sydney Gardens, Bath.—Secretary, Mr. F. J. Cashella, 7, Cambridge Place, Bath.

DUNDEE HORTICULTURAL SOCIETY.—Summer exhibition, to be held on August 25, 26 and 27, on Magdalen Green; Chrysanthemum exhibition to be held on November 18 and 19, in the Drill Hall.—Secretary, Mr. J. M. Martin, 53, West Port, Dundee.

ABBEY PARK FLOWER SHOW.—Thirty-eighth exhibition, to be held on August 2 and 3.—Superintendent, Mr. R. Lisle, Abbey Park, Leicester.

BIDEFORD AND DISTRICT HORTICULTURAL SHOW.—Annual Show to be held in The Market, Bideford, on Wednesday, November 2.—Secretary, Mr. H. Page, 18, Chanter's Lane, Bideford.

NATIONAL CARNATION AND PICOTEE SOCIETY.—Exhibition to be held at the Royal Horticultural Hall, on Tuesday, July 19; exhibition to be held in conjunction with the Forest Row Horticultural Society, at Kidbrook Park, Sussex, on Saturday, July 23.—Secretary, Mr. E. G. Lowe, 147, Melrose Avenue, N.W.2.

## GARDENING APPOINTMENT.

Mr. M. S. Fossor, for nearly twenty years gardener at Umberslade Hall, Warwickshire, and lately at Gledhow Hall Gardens, Leeds, as gardener to the EARL OF FAVERSHAM, at Duncombe Park, Helmsley, Yorkshire. (Thanks for 2/- for B.G.O.F. Box.—Eds.).

## CATALOGUES RECEIVED.

J. E. HARRISON AND SONS, Darras Hall Nurseries, Ponteland, Nr. Newcastle-on-Tyne.—Violas.

E. P. DIXON AND SONS, LTD., Hull.—Farm Seeds.

H. HANCHET, Nutfield Nurseries, Crab Hill Lane, South Nutfield, Surrey.—Seeds.

JAMES MACDONALD, Harpenden, Herts.—Lawns and Sports grounds.

## Foreign.

GOOS AND KOENEMANN, Nieder-Walluf a Rhelm.—Plants. VILMORIN ANDRIEU ET CIE., 4, Quai de la Mégisserie, Paris.—Plants.

# SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## MUNICIPAL AND PUBLIC.

BECKENHAM URBAN DISTRICT COUNCIL.  
HEAD GARDENER AND CARETAKER.

THE Beckenham Urban District Council invite applications from experienced Gardeners to act (under the Parks Superintendent) as Head Gardener and Caretaker at the Croydon Road Recreation Ground, Beckenham. Wages, £2 18s. 0d. per week, together with house (rent and rates free). The man appointed will be required to pass a medical examination and to contribute to the Superannuation Fund. Applications, giving age (which must not exceed 40 years) and previous experience, accompanied by copies of not more than three recent testimonials, to be addressed and delivered to the SURVEYOR to the Council, not later than Saturday, April 9, 1927.

F. W. GEDNEY,  
Clerk to the Council.

Council Offices,  
Beckenham.  
18th March, 1927.

## PRIVATE.

**HEAD WORKING GARDENER** wanted. Only those with experience as Head need apply. 4 in all. Cottage. Experienced Inside with vines and Out. State wages, references and full particulars.—Apply by letter in first instance.—LADY MACALPINE, Broad Oak, Accrington, Lancs.

**GARDENER** required, married, Staines district, to take full control of orchard, garden, lawn, covering 3 acres, some assistance given; wife required to give about 10 hours domestic service weekly; appointment includes modern cottage with bathroom and central heating.—Reply by letter, with copy testimonials, stating age, salary required, and number in family.—X. Y. Z., Box 84, 5, Tavistock Street, Covent Garden, W.C.2.

**VISCOUNT EBRINGTON** requires **SINGLE-HANDED GARDENER**; small greenhouse, no kitchen garden; willing to milk and make himself generally useful. Good cottage available.—Address, Ebrington Manor, Campden, Glos.

**FOREMAN**, Inside, wanted at once. Married, age 28 to 30, well up in the cultivation of Melons, Carnations, "Mums, etc., and a first-class decorator. Head Gardener's recommendation. Wages commencing at £2 per week; duty every fourth week.—Full particulars to A. CLARKE, The Willows Gardens, Clewer, Windsor.

## SITUATIONS WANTED

Twenty words 2s., and 3d. for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.

### SUGGESTIONS FOR ADVERTISERS.

Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.

Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end: if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.

No letter or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.

It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).

No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.

An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.

### PRIVATE.

**H**AD GARDENER or GARDENER-STEWARD.—The Hon. Constance Russell, Ampt-hill Park, Ampt-hill, Beds., highly recommends **CHARLES TURNER**, who has been Head Gardener at Ampt-hill Park for 10 years. First rate in every branch, and an excellent manager.—Reply, **TURNER**, at above address.

## A Glass House that weathers the weather—even English weather

English weather is notoriously varied. Your  
Glass House cannot afford to be a frail  
structure, for one day it is being lashed with  
hail, the next, being scorched with a withering  
sun.

Duncan Tucker Glass Houses defy time because  
their builders have an eye on the weather.  
Come rain—come wind—come snow—come frost;  
they resist them all.

The solid workmanship and careful finish William  
Duncan Tucker & Sons Ltd. impart to their  
work is the result of long experience. For close  
on a hundred years they have been the experts  
in Glass House creative and repair work—  
and they are still.

ALRESFORD, HANTS.

PROSPECTUS FREE ANYWHERE.

## A WEEK'S WORK IN ONE DAY!

## Hoeing Without Effort.

**THERE** is now only one way to Hoe: with "The Hampson Patent Shoulder Hoe." Using this implement there is no fatiguing movement of the arms as with the old-fashioned implement. The hands rest upon the cross handle and simply guide the hoe as required. The leverage is borne by the shoulder. Nothing complicated—nothing to learn. The obviously right way to do the job.

## LEADING AUTHORITIES TESTIFY.

"We, the undersigned, have witnessed actual trials of 'The Hampson Shoulder Hoe,' and we are convinced that a man using 'The Hampson Shoulder Hoe' can do from six to eight times more work with it in a given time than a man can do with an ordinary hoe. Not only is the work done quicker and easier, but also much better and with practically no physical exertion—the weeds are uprooted and left to shrivel."

## WILLIS BROS.' Garden Fertiliser

**THE BEST ON THE MARKET.**  
**NO STABLE MANURE REQUIRED.**  
For digging in or as a top-dressing. For kitchen Gardens or Herbaceous Borders.

1 cwt., 15/-; 1/2-cwt., 9/-; 28 lb. 5/-; £14 10/- per ton. All Carriage Paid.

### LOOK TO YOUR VINES!

The Vine requires a large quantity of Potash for its proper growth and the development of fruit. WILLIS BROS. VINE MANURE contains 7% Potash, 22% Phosphate, and 4% Nitrogen, and the results justify us in saying it is the best on the market. The effect on old vines is very marked, it puts new life into them.

1 cwt., 25/-; 56 lb. 14/-; 28 lb. 8/- All Carriage Paid

### LAWN MANURE.

Having been connected with the experimental manuring of pastures, etc., for over 40 years, we are in the position to offer the above with perfect confidence as to results. It is especially suitable for poor mossy lawns, improving the texture of the grass, and helping the lawns to keep their colour in dry seasons. Can be used at the rate of 5 cwt. to the acre.

1 cwt., 20/-; 10 cwt., £9 15/-; 1 ton., £19. Carriage Paid. Special Prices quoted for Grass Manures for Park Land in quantities.

### LAWN SAND AND DAISY KILLER.

This preparation will be found very effective for thickening the sward and encouraging the grasses; also destroys the daisies and other weeds so troublesome on lawns. 1 cwt., 25/-; 10 cwt., £12. Carriage Paid.

**DIRECTIONS FOR USE.**—Sprinkle thinly over the surface of the lawns at the rate of 4 to 6 ozs. to the square yard; where a mass of weeds occurs a little more may be used, as the grass cannot get through until the weeds are killed. A dry day in autumn or spring is the best time to apply the LAWN SAND.

### SUSSEX TRUG BASKETS.

18" 4/-; 20" 5/-; 23" 6/-; 26" 7/-; 28" 8/-; each. Carriage Paid.

### GARDEN SUPPLIES AT LOWEST PRICES.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 46.1°.

## ACTUAL TEMPERATURE—

The Gardeners' Chronicle Office, 5, Tavistock Street, Covent Garden, London, Wednesday, March 30, 10 a.m. Bar. 29.7. Temp. 51°. Weather, Cloudy.

To impatient gardeners—if such incompatibles exist—the tarrying of spring is a severe disappointment.

## A Late Spring.

Except the early ones, and those only in favoured places, the Daffodils definitely refused to take the winds of March with beauty, and until the burst of sunshine on two recent balmy days, plants generally were at least two weeks behind their ordinary time table. It is true that there are some plants which seem to ignore or even revel in seasonal inclemencies. Thus we have never seen a more lavish display of blossom than that which covered Rhododendron praecox in February of this year, and other yet earlier Rhododendrons have, it appears, flowered well; but one swallow does not make a summer, and we learn that the prospects of blossom on later-flowering Rhododendrons is poor, not only in less favoured parts of the country, but also in Cornwall. The knowledgeable in these things attribute the paucity of blossom buds to the inclemency of the weather during last May—so long are the shadows which weather casts on vegetation. There can be little doubt but that the lateness of the present season is due to a combination of two causes. The soil which has been so drenched during the winter is still cold and

although perhaps the air has not been very cool during the day—albeit it has certainly seemed so to humans—it has been cold at night. We think, moreover, that the extreme and constant humidity of the air during the day has made it cold for blossoms. For the latent heat of water is great, and we can easily imagine that each time a blossom bud began to perform the preliminaries to its unfolding, its activities were rendered nugatory by the humidity of the air. As thus: whereas the older parts of plants are, as compared with animals, of sluggish respiratory activity, the young parts of plants—flower buds and growing tissues—generally respire at least as actively as do animals. Now respiration is an energy-releasing process, and of the energy released by that internal combustion process called respiration, not a little takes the form of heat, which heat must, of course, quicken growth. Since, however, a watery blanket has enfolded our plants during these recent months, the heat produced by each floral essay in respiration has been absorbed by the water, and there has been none left to help the flower itself to expand. These somewhat remote reflections were forced upon us by the curious behaviour of a pleached avenue of Prunus pissardii, which came under our observation this spring. The trees were full of blossom bud. Many branches had to be removed in order to complete the over-arching of the trees. These were carried off to London and stood in water in the gloom and warmth of a London flat. The trees in the gardens just shuffled through their flowering time pursued and overtaken by premature leaf-growth, so that the brave show which this pleached avenue usually presents in spring was not realised this year. Yet the branches standing in water in the room have been and still are spangled profusely with blossom; even those which received no direct daylight. The relatively dry air and the congenial temperature which obtained within doors encouraged the flower buds to develop, whereas the saturated state and lower temperature of the open air rendered naught the lavish preparation which the trees had made for flowering. Anyone who walked along Piccadilly recently—say on March 22—saw vegetation working a like miracle. The day before there was no green in the groups of Thorns. On that day, when the sun shone and the air was drier, the buds burst and opened widely, almost visibly pouring out the cataract of green. So it happens every year in certain tropical countries where wet and dry seasons alternate. Here we only rarely see such sharp transitions. The importance which we have ascribed to the high moisture content of the atmosphere in contributing to the lateness of the present spring is, of course, conjectural, but it receives powerful support from the well-known fact that many greenhouse plants may be kept from flowering by maintaining a high degree of humidity in the air about them. It would be a pretty task for the plant physiologist to measure comparatively the rate of respiration of leaf and flower buds, and to determine the temperature at which they severally unfold. Such measurements would, we think, prove decisively whether these views are right or wrong.

## Botanical Specimens for the Liverpool Museum.

—Mr. W. H. Stansfield, of Southport, has presented a fine collection of botanical specimens to the Liverpool Library Museum and Arts Committee. Upwards of six hundred species and varieties of Ferns, chiefly exotic, are included, together with an almost complete collection of

mounted and named specimens of varietal forms of British Ferns collected by the donor, who has a special knowledge of our native Ferns and their variations, and a wide acquaintance with alpine plants.

**Garden Architecture.**—On Monday evening, March 21, at a general meeting of the Architectural Association, at 35, Bedford Square, W.C.1, Mr. Gilbert H. Jenkins, F.R.I.B.A., read a paper on "Garden Design," illustrated with a number of lantern slides showing views of some well-known gardens in this country and on the Continent, and also some modern gardens designed by Mr. Guy Dawber and others. Mr. Jenkins remarked that since the war it had been necessary in many gardens to reduce the cost of upkeep, and this had had a marked effect on the general style of gardens. The vogue of lawn tennis had influenced the planning of many gardens, as the courts had to be provided for and screened from the rest of the garden. He also dwelt at some length on the subject of the woodland garden. An interesting discussion followed the reading of the paper.

**Horticultural Club.**—Following a Dinner of the Horticultural Club on Tuesday, April 5, at the Trocadero Restaurant, Piccadilly Circus, Mr. W. B. Cranfield, President of the British Pteridological Society, will deliver an address on "British Ferns and Their Varieties," illustrated by lantern slides. The Club dinners and lectures of the present session have been most successful. At the recent meeting of the Committee, twelve new members were elected, including Sir William Lawrence, Treasurer of the Royal Horticultural Society; Mr. A. Simmonds, Assistant Secretary, Royal Horticultural Society; Mr. F. G. Preston, Superintendent, Royal Botanic Garden, Cambridge; Mr. R. Findlay, Keeper of the Royal Horticultural Society's Garden, Wisley; Mr. A. J. Cobb, Lecturer and Director of the Horticultural Department of the University of Reading; Mr. T. Hay, Superintendent, Hyde Park; Mr. C. T. Musgrave, and Mr. W. R. Oldham.

**Daffodils at Lanarth.**—An interesting event, from the growers' standpoint, took place on a recent Friday, when Mr. P. D. Williams invited a number of Penzance growers to Lanarth St. Keverne, Cornwall, to see his collection of Narcissi. The party was accompanied by the Rev. A. T. Boscawen, Chairman of the Western Commercial Horticultural Show; Mr. H. W. Abbiss, Horticultural Superintendent for Cornwall; and Mr. Gunnigham, who is in charge of the Experimental Station at Gulval. The gathering was very representative of the growers of the district, who not only had the privilege of seeing many of Mr. Williams' new creations, but obtained many valuable cultural hints. Mr. Williams emphasised the importance of removing shelter after flowering, and showed the growers how the Narcissus fly bred where shelter was not removed. He also told them how important it was for bulbs to be graded for planting purposes. During the tour the party was particularly impressed by Godolphin, a very fine trumpet Daffodil; Fanfare, with a fine, self-yellow trumpet; and Bonython, another very bold and beautifully coloured trumpet variety. The size and vigour of the new early-flowering variety, Magnificence, arrested attention; this is earlier than Henry Irving, of better constitution and promises to replace that well-known sort. Another useful variety was Boswyn, which appears to fill the gap between Henry Irving and Golden Spur. Other varieties much admired were Hospodar, Medusa, Charles I, White Nile, Tunis, Tregoose—a variety with orange colouring in the cup—(see Fig. 112) and Kennack. The last-named variety has done well in New Zealand, where it has taken many premier awards. Only a few Daffodil varieties are grown by Mr. Williams on a commercial scale, and these include Croesus and Sunrise. Not only was the visit interesting from the commercial bulb-growers' standpoint, but the tour of Mr. Williams' garden afforded evidence of the way in which tender shrubs appreciate the mild Cornish climate. Plants greatly admired were Rhododendron racemosum and R. caucasicum hybrids; Prunus incisa, Osmanthus Delavayi, and Myrtus apiculata,

with its brilliantly-coloured, brown wood. The party was entertained to tea by Mr. and Mrs. Williams, and a very interesting discussion followed, which was considerably enhanced by the observations of Mr. Douglas Pennant, who stressed the importance of the experimental side of the growers' work, and pointed out that the growers in the Lea Valley were wonderfully well-served by their Cheshunt Experimental Station. Votes of thanks were accorded to Mr. and Mrs. Williams by the Rev. A. T. Boscawen, who, in turn, was thanked by Mr. Abbiss for organising the trip.

**Pruning Hardy Shrubs.**—The subject of the lecture at Vincent Square, on Tuesday next, April 5, at 3 p.m., is "The Pruning of Hardy Shrubs," by Mr. Arthur Osborn, Royal Botanic Gardens, Kew. In addition to lantern slides the lecture will be illustrated by specimens of unpruned and pruned shoots, showing the varied methods of pruning which are desirable in a representative collection of flowering deciduous and evergreen shrubs.

**Tewkesbury Daffodil and Spring Flower Show.**—In a schedule of fifty-two classes the Tewkesbury Daffodil and Spring Flower Society provides no fewer than twenty-seven for Daffodils alone, the others being arranged for Cinerarias, Primulas, Amaryllis, Cyclamens, Richardias and other pot plants, and for Polyanthuses, wild flowers and miscellaneous groups. The prizes include several silver vases. The exhibition will be held in the Town Hall, Tewkesbury, on Thursday, April 14; the Hon. Secretary is Mr. J. S. Gannaway, Eastville, Ashchurch Road, Tewkesbury.

**Retirement of Mr. J. K. Budde.**—Our readers will recollect that in our issue of March 27, 1926, we gave a portrait (on p. 224) of Mr. J. K. Budde, the Curator of the University Botanic Garden of Utrecht, Holland, at the same time announcing the news of his approaching retirement under the age-limit of sixty-five years. Although Mr. Budde was due to retire last November, he has, at the request of the University authorities, consented to remain at his post until the present time; but this month (April) he will probably be definitely leaving the scene of his labours for so many years, and starting on the journey to Buitenzorg, Java, which he has long intended should be the first use he would make of his well-earned leisure. Mr. Budde has a very large circle of friends, both in his own and in foreign countries, and some of these are getting up a testimonial to him, which it is thought should take the form of a purse of money, especially in view of the heavy expense involved by his projected trip to Java. The matter is in the capable hands of Mr. A. J. Labouchere, Maliebaan 14, Utrecht, Holland.

**Roof Garden at May Fair Hotel.**—A roof garden on a large scale is a feature of the new May Fair Hotel, in Berkeley Square. It has been laid out and will be maintained by Mr. George G. Whitelegg. Nearly 9,000 Tulips, 10,000 Daffodils and brilliant displays of flowering shrubs and trees are provided, while shrubs in tubs are placed here and there about the paved and grass-edged walks.

**Midland Daffodil Show.**—The Midland Daffodil Society will hold its exhibition at Birmingham on April 21 and 22. Schedules may be obtained from the Secretary, Mr. Herbert Smith, 19, Tenby Street North, Birmingham.

**Amateur Show at Vincent Square.**—The schedule for the Amateur Show to be held by the Royal Horticultural Society at Westminster, on June 28 next, is an interesting one, and should encourage a keen competition among amateurs. There are no fewer than ninety-five classes, arranged in three groups: (A) open to all amateurs; (B) open only to those amateurs who do not regularly employ more paid assistants in the garden than one gardener and one boy; and (C) open only to those amateurs who employ no gardener, but occasional employment of outside assistance for heavy work, such as digging or trenching, shall not prevent an amateur from competing in this division. The classes for Roses have been increased from seven to sixteen, while new classes have been adopted for flowering sprays

of hardy shrubs, alpine plants, Lilliums, Water Lilies, Rhododendrons, new species introduced since 1920, and new plants of garden origin raised since 1920. Substantial prizes are offered and special cups will be awarded to the most successful competitor in each division.

**Mr. Arthur Blackburn.**—To the many attractions it already possesses, Blackpool will add a big flower show during July. As this exhibition will be held in Stanley Park, it will necessarily draw special attention to the Parks and Open Spaces of this popular seaside resort. The Superintendent of the Parks and Open Spaces and Cemetery is Mr. Arthur Blackburn, who has also been appointed Manager of the Flower Show. He is a native of Cumberland, and commenced his gardening career at Brent House, Penrith, and continued it at Calthwaite Hall, before serving for four years under his father at Underscar, Keswick. From Underscar he went to Kew, where he stayed for two years-and-a-half; then followed periods of service in a private garden at Derby and at Queen's Park, Glasgow, ere he entered the Parks Department of Swansea, where he served for eight-and-a-half years as Chief Assistant to Mr. D. Bliss, until he received his appointment at Blackpool

MR. ARTHUR BLACKBURN.

in March, 1918. When Mr. Blackburn went to Blackpool a Parks Department could hardly be said to exist, but rapid developments have taken place during his tenure of office, and for the past four-and-a-half years he has been engaged in collaboration with Messrs. T. H. Mawson and Sons, in laying out 230 of the 361 acres of Stanley Park, at an estimated cost of £170,000. Nine other open spaces, including the foreshore, come under Mr. Blackburn's charge. He is also Registrar of the Cemetery and has done considerable organising work in connection with the Blackpool Carnivals. Some evidence of the high esteem in which Mr. Blackburn is held by his confrères is shown by his appointment as Secretary to the newly formed Association of Parks Superintendents. Fortunately, Mr. Blackburn is in the prime of life, and an enthusiastic worker and organiser.

**Bequest to the Gardeners' Royal Benevolent Institution.**—The Treasurer desires to acknowledge with thanks from the Executors of the late Mrs. M. A. Monro, J.P., receipt of a legacy bequeathed by her to the above Institution on the following conditions: "To the Gardeners' Royal Benevolent Institution, of 92, Victoria Street, Westminster, Five Hundred Pounds, to be called the 'Mrs. Geo. Monro Fund,' the annual income from which shall be applied by the Trustees of the said Institution in providing an annual pension in accordance

with the regulations of the said Institution or otherwise as my Trustees shall approve." The late Mrs. M. A. Monro was the widow of the late Mr. Geo. Monro, V.M.H., who was a member of the Committee of Management of the Gardeners' Royal Benevolent Institution for forty-five years.

**Shrewsbury Floral Fete.**—The Committee of the Shropshire Horticultural Society is offering several prizes of unusual interest, to be competed for at the Shrewsbury Floral Fête, on August 17 and 18. There are bronze Japanese works of art, five in number, offered respectively for a collection of Orchids, a collection of Carnations, a collection of Roses (a beautiful, finely-inlaid jardinière), a collection of Gladioli, and twenty-four dishes of fruits. All these "trophies" are illustrated in the schedule now obtainable from the Secretary, Mr. W. G. Brazier.

**National Auricula and Primula Society.**—The Southern Section of the National Auricula and Primula Society has completed its fiftieth year, and a special jubilee issue of the *Report* has been published to mark the occasion. The Society originated in a decision to hold an exhibition in London in 1877, and a Committee was appointed with Mr. Francis Whitbourne as President, Mr. Charles Turner as Vice-President, and Mr. Dodwell as Hon. Secretary. At a subsequent meeting, Mr. Turner reported that the Crystal Palace authorities had agreed to make arrangements to hold the show on April 24, 1877, and offered a donation of £10 to the prize fund. The exhibition was held on the date mentioned and was said to be "the grandest display of these interesting, old-fashioned flowers which has ever been held in London or elsewhere." The original schedule varied little from that in force to-day, except that it included more classes, for apparently the Society was then in better funds than at present, as upwards of £60 was promised towards the necessary prizes and expenses. The Society continued to hold shows for some years at South Kensington, and then migrated to the Drill Hall of the London Scottish Rifles, and later to Vincent Square, where the shows are still held, the exhibition for this year being fixed for April 26 and 27. Some prominent florists have been connected with the Society, including the Rev. F. D. Horner, James Douglas, Charles Turner, Ben Simonite, Samuel Barlow, Richard Dean, J. T. Bennett-Poe and W. Sarjent. The veteran Sir John T. D. Llewelyn still holds the office of President, and the members include a small, but enthusiastic band of lovers of these old-fashioned flowers, although we regret to see that the income for 1926 from subscriptions only amounted to a little over £27. The *Report* includes illustrations of some notable show varieties of Auricula, for which the Society is indebted to Mr. J. J. Keen, who has also written an interesting summary of the history of the Society, entitled, "A Look Backward," and he describes many of the most notable varieties. Those who would like to grow the old florists' Auricula will find some very valuable hints on the cultivation of the flower in an article entitled, "Work Month by Month." The Secretary, Mr. Arthur S. Hampton, 63, Tilehurst Road, Reading, states that copies of the *Report* are available to non-members at a cost of 1s. each. Those who love old-fashioned flowers will learn from the *Report* the seven points which comprise the standard of excellence in the show Auricula.

**Opening of Beddington Park.**—Last Saturday, Beddington Park, in its entirety, was formally opened to the public. In 1925, rather over thirteen acres of the park were purchased by the Beddington and Wallington District Council, and now eight-four acres, at a cost of £21,000, have been added. Most of the land will remain as park land, but several acres have been laid out for various sports and games.

**The Public Taste in Potatoes.**—At the Ideal Home Exhibition the Ministry of Agriculture arranged a demonstration each evening of the various ways of cooking Potatoes for the table, and at each demonstration a short address was given on various points of interest in con-

nection with this vegetable. On Tuesday, March 15, the discussion centred on the public taste in Potatoes, and ladies present at the demonstration were invited to express their particular likes and dislikes in the matter of texture and colour of cooked tubers. Of two hundred votes recorded, eight-five per cent. showed a preference for a white, floury Potato for general household purposes, and fifteen per cent. for a light-coloured, waxy Potato. No vote was recorded in favour of a dark, waxy type. It is stated that in France and Spain yellow-fleshed, waxy Potatoes are preferred, whilst in Germany, waxy, almost soapy Potatoes, are most popular. Scotland and Ireland prefer a white, floury Potato, but in London the consumers as a whole, and especially the catering trade, are said to be less partial to the floury type than formerly, and prefer a firm, close textured Potato. Connoisseurs are generally agreed that the finest flavour is found in the yellow-fleshed sorts, especially amongst the earlies, and that some of the modern, white, mealy Potatoes are not nearly so finely flavoured as many of the older sorts. In the trials of Potatoes conducted by the Royal Horticultural Society at Wisley, good flavour is always regarded as a *sine qua non* of merit, and cooked tubers are tasted by the judges. Golden Wonder and Lady Llewelyn are two varieties notable for their fine flavour, but, unfortunately, growers have to consider other qualities, of which one of the most important is cropping, and high flavour does not always accompany a heavy yield.

**Chrysanthemum Congress in Paris.**—The twenty-seventh annual Congress of the French Chrysanthemum Society will be held in Paris this year, from October 26th to the 28th, coinciding with the Autumn Centenary Exhibition of the French National Horticultural Society. The prize list will be an unusually interesting one; the Chrysanthemum section of the National Society has raised 700 francs for a special prize, the Delafon Cup is valued at 1,000 francs, and other special contributions to the list are being made by MM. A. Nonin, P. Féron, Ch. Souchet, and Gaston Clément. Among the subjects to be discussed at the Congress are the use of sulphur in compost; the employment of manures in the open air and in pot culture; pests and diseases, etc.

**Annuity for a Gardener.**—The late Miss Annie Clark Compton, of Alwyne House, Horsell, Surrey, who died on January 2, left an annuity of £200 to her gardener, Mr. H. Hampton.

**Appointments for the Ensuing Week.**—**SUNDAY, APRIL 3:** Wakefield and North of England Tulip Society's meeting. **MONDAY, APRIL 4:** Romsey Gardeners' Association's meeting. **TUESDAY, APRIL 5:** Royal Horticultural Society's Committees meet (two days); Horticultural Club Dinner and Lecture; Royal Caledonian Horticultural Society's meeting; Wimbledon Gardeners' Society's meeting. **WEDNESDAY, APRIL 6:** Brighton, Hove and Sussex Horticultural Society's show (two days); Falmouth Spring Flower Show (two days); Royal Horticultural Society of Ireland Spring Show (two days); Nottingham and Notts. Chrysanthemum Society's meeting; Pangbourne and District Gardeners' Mutual Improvement Association's lecture. **THURSDAY, APRIL 7:** Manchester and North of England Orchid Society's meeting. **FRIDAY, APRIL 8:** Royal Horticultural Society of Ireland meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Sikkim Rhododendrons.*—Whoever reads the glowing description of the effect produced by miles of Rhododendrons in the Sikkim Himalaya by an eye-witness, the enterprising Dr. Hooker, will feel a wish that portions of our own scenery may be enriched by some, at least, of the Asiatic natives, in like manner as the Rhododendrons of Turkey and of America have become subservient to that purpose. It is certainly early to predicate, but I am of opinion that certain of the species and varieties will make themselves at home at this our English soil. Through the liberality of Sir Wm. J. Hooker, of the Royal Botanic Gardens at Kew, I was favoured with seeds of many of the kinds figured in the splendid work devoted to their

illustration. Like other cultivators, my success has been but partial, some kinds not germinating at all, some freely, and some but partially. In a few instances the young plants were scarcely developed, and the signs of death became painfully obvious; some remained in the seed-pans, and some were pricked out; some were kept warm and shaded; others warm, and a degree of light admitted; whilst others were exposed to the open air; and lastly, some were placed in a cold frame with a northern aspect. Some of the kinds, of which *R. setosum* may serve as an example, seemed to pine for their mountain air and pressure of snow; and so with all the variations of culture, death speedily ensued. This class of them, I fear, will resist all culture; and we must be content

defined gold margins as bright as those of Hollies. Another species, the glaucum, and its dwarf variety, have both stood and braved the twelve degrees of frost equal to any of those before enumerated, but their foliage is thinner in texture, and the colour of their green less intense than any of their associates. This glaucum is so like *Kalmia angustifolia*, in a young state, in its foliage, that it might well have joyed in the name of *Kalmioides*, and as a consequence, if the plate be examined, the manner of inflorescence, as well as a modified form and colour will be apparent to that of *Kalmia latifolia*. But let me not be supposed to cavil at the nomenclature of the species; on the contrary, the union of the most remarkable persons connected with India, politically

FIG. 111.—RHODODENDRON VIRGATUM (K.W. 6279).

R.H.S. Award of Merit, March 22. Flowers bluish rose. Shown by Lt.-Col. L. C. R. Messel, Nymans, Sussex.

to know of them only by dried specimens or coloured engravings. Fortunately the most showy, if not the most curious, affect no such conditions, but appear to accommodate themselves to our frame culture—to our damp stove growing, and to the open air, and seem vigorous and healthy alike in each. The greater number of my plants have been kept during winter in cold frames—some planted out in the prepared earth, and some in pots; they are equally healthy and promising in each manner; but another portion having been planted in the open air, between rows of *R. ponticum* of the same age, afford the greatest interest. The sorts that have survived uninjured, and are even more robust, carrying darker leaves than *ponticum*, are: *R. niveum*, *campylocarpum*, *fulgens*, *aeruginosum*, alpine variety, and *ciliatum*. This latter plant has shown the tendency to sport which many plants do under culture, for amongst them are two plants with well-

and scientifically, seems most fitting; uniting as it does the Aucklands, Dalhousies, the Campbells, the Wallichs, the Royles, the Hodgsons, etc., as it were into one bond, and whose united efforts were directed to the advancement of the civilisation and the extension of science, both in Asia and the rest of the world. *William Masters, Exotic Nursery, Canterbury, March 31. Gard. Chron., April 3, 1852.*

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Coelogyne.**—*Coelogyne cristata* and its varieties are in bloom. This Orchid does not need to be disturbed at the roots very often, but specimens that have overgrown their receptacles or where the rooting medium is decomposed, should be turned out of their pots or pans, the old soil and dead roots removed, and the back pseudo-bulbs cut away, leaving only three behind each growing point. Pans are preferable to pots for this class of Orchids and, as *Coelogyne*s are shallow-rooting plants, the pans should be filled quite half their depth with drainage material.

**Compost.**—The compost should consist of two parts *Osmunda* fibre to one of peat, and *Sphagnum*-moss cut up according to the size of the plants and the receptacles. The larger the plant, the coarser should be the material. In re-making the plants into specimens, a number of leads or growing points are necessary, and they should be arranged evenly over the surface so that the centre of the specimen is well furnished with growing points, and each new growth has room to develop. It may be necessary in some cases to use wire pegs to hold the pseudo-bulbs in position until the plants are re-established in the new material. After repotting them it is advisable to spray the plants overhead on bright days, and maintain a humid atmosphere around them, but water should be afforded the roots sparingly. Where numbers of these plants are grown, a few specimens should be repotted each year, as often after disturbance at the roots they fail to flower so freely or so strongly as when they are thoroughly established.

**Other Species of *Coelogyne*.**—The genus *Coelogyne* is a large one and contains a number of plants of horticultural merit, some one or more being in flower during the greater part of the year, hence the repotting of the different species will practically be spread over the twelve months. It is always safe to repot any plant that is in need of new rooting material whenever the new growths are about to develop fresh roots, as the plant at that stage receives the least check possible. A few, such as *C. Massangeana* and *C. Dayana* are, on account of their pendulous scapes, best grown in pans or baskets, in order that they may be suspended, to show their flowers to the best advantage. *Coelogyne*s that inhabit hot, damp countries, should be grown in the warmest house; they embrace *C. asperata*, *C. Rossiana*, *C. pandurata*, *C. Parishii*, *C. Micholitzii*, *C. Dayana*, and *C. Cummingii*, while *C. barbata*, *C. Mooreana*, *C. flaccida*, *C. sparsa*, *C. elata*, *C. graminifolia*, *C. ocellata*, *C. Gardneriana* and *C. speciosa* may be grown in a house having an intermediate temperature. Shade is needed by all *Coelogyne*s during the summer, and at no time should the compost be allowed to become excessively dry. Although during the resting season the water supply should be less both in quantity and frequency, sufficient moisture must be given to keep the pseudo-bulbs in a plump and healthy condition, as shrivelling is detrimental to the plants flowering satisfactorily.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTREE, Horsley Hall, Gresford, N. Wales.

**Seakale Sets.**—The prepared roots may be planted in ground which has been thoroughly trenched and manured. Use a dibber to make the holes, and take care that the thongs are firm in the soil. The rows should be two feet apart and the sets one foot asunder in the rows. When the shoots commence to grow freely they should be thinned, leaving only one strong

crown to mature. Use the Dutch hoe freely between the plants, and should the weather prove very dry, and especially on light soils, apply a dressing of salt.

**Beetroot.**—A few rows of the round or globe varieties of Beet may be sown in well-prepared ground, in a warm, sunny position. These will form a succession to those growing in frames. The bed should either be netted, or strands of black cotton placed alongside the rows. The latter is always the best measure if adopted before the young plants are attacked.

**Potatos.**—The planting of Potatos may now be proceeded with, though it will be wise not to plant on too large a scale for the present, especially in exposed situations, as the shoots of tubers which are sprouted quickly show through the soil after a few warm days, and, as May frosts often do much damage, caution must be exercised. When planting, do not bury the tubers too deeply or the crop will be weak and poor. Allow plenty of space both between the rows and also the sets, as light, air and warmth are all very necessary. Distances apart for strong-growing varieties should not be less than thirty inches by eighteen inches. Keep an eye on Potatos that were planted earlier and, should frost threaten, draw a little fine soil over any that are showing above ground.

**Broccoli.**—The heads of these plants are making rapid progress, and care should be taken to see that the curds are kept well-covered with the leaves of the plant, as frosts quickly damage them, and sunlight discolours them. Should the plants of later varieties appear to be stunted in growth, a sprinkling of sulphate of ammonia between the rows and hoed into the ground will stimulate their development.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brocket Hall, Hertfordshire.

**Perpetual Carnations.**—The object of stopping Carnations is to obtain bushy plants that will produce several flower stems at the same date. The time to carry out this operation depends entirely on the plants under cultivation, but it should not be practised at the actual time of potting. It should be done when the young plants are making good roots in their small pots, or be deferred until they have begun to form roots when transferred to fifty-four-sized pots, but in any case it is not wise to allow the shoots to become hard before stopping them, or an uneven and disappointing growth will result. The young plants should be kept free from aphids by lightly fumigating the house on frequent occasions, otherwise the young growths will show signs of the neglect at a later period.

**Browallia speciosa.**—This useful plant may be raised easily from seeds and good examples obtained for decorative purposes by the month of August. This plant will thrive in almost any soil. When the receptacles are well-filled with roots liberal supplies of liquid manure are most beneficial to them. Although this *Browallia* may be propagated from cuttings, I always consider that seedlings grow more vigorously.

**Camellias.**—Although these plants are not so commonly grown as formerly, they are useful for the cool greenhouse. They may be grown either in pots or planted out in small borders and trained up unsightly walls. They thrive best in a house from which frost is just excluded. Plants growing in pots and needing repotting may be attended to now that the young growth is active. The compost may consist of equal parts of good fibrous loam and peat with sufficient broken charcoal and sand to ensure efficient drainage. Those planted out in borders may have a small portion of the surface soil removed and a top-dressing of sweet compost substituted.

**Fuchsias.**—Specimen Fuchsias that have been kept somewhat on the dry side during the winter may now be pruned, and attention given

them with regards to potting or top-dressing, as the needs may be. If repotting is considered necessary, use a compost of good loam, leaf-mould and dried cow manure, after passing the latter through a fine sieve. These plants require liberal supplies of liquid manure when in full growth.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Thinning Grapes.**—At this season of the year the thinning of Grapes will almost be a daily operation. It is hardly possible to state how many bunches a healthy vine should carry, as under-cropping as well as over-cropping should be avoided; much depends on the health and vigour of the vines. Judicious thinning not only ensures finer quality in the berries, but also has a bearing on the health of the vines. Some growers allow one bunch to each spur, but this is a very heavy crop indeed, no matter how good and plentiful the foliage may be. If they are good bunches, one third of those formed should be removed so soon as they are out of flower and the best bunches can be decided upon. The tendency of amateurs and beginners is to postpone this work, resulting in waste of the vine's energies. The Grapes of vines that have not been thinned early often shank or fall short in size of berry and bloom, which size of bunch cannot compensate for. The quality is also second-rate, and the crop does not in the aggregate weigh more than half the same number of bunches in which the berries have developed and finished to perfection. After the stoning period is too late for reducing the crop, but if the vines do not continue to make plenty of laterals, it is better to further reduce the bunches even then. Thinning is a skillful operation which can only be attained by practice and thorough acquaintance with the different varieties, and of certain vines of the same sort. The berries of free-setting varieties may be thinned immediately after they are well set. Muscats and others which require artificial pollination should be allowed a little more time for the grower to see which berries take the lead, and so far as practicable those left behind should be removed, as stoneless berries never develop properly. A bold attack on these seedless berries generally results in a thinly-set bunch of Muscats becoming quite full enough of berries. Lady Downes, Alicante, Gros Maroc and Gros Colmar should be thinned until there is no danger of the berries touching each other tightly, otherwise their keeping qualities will be doubtful. Early and summer Grapes for immediate use do not suffer so much by being under-thinned as the preceding. Tying up the shoulders to increase the size of the bunch should, so far as possible, precede thinning.

**Late Vines.**—These vines are rather later than usual this year, and their development should be hastened by the use of a moderate amount of fire-heat; close the house early in the day and syringe with tepid water liberally twice daily. Late Grapes may be grown in a temperature of 55° on cold nights, 65° to 70° by day and 75° after closing the house, with sun-heat, from the time the buds begin to develop until the bunches are prominent. From this stage forward the temperature may be increased 5° at night and still more by day, with 65° as the minimum when the vines come into flower. Where all the border space has been filled with soil, apply a mulch of fresh, short, stable litter, including the droppings. The litter will not only provide the roots with food but be a never failing source of atmospheric moisture.

**Early Vines.**—So soon as the Grapes in the early house have finished stoning, examine the bunches for the last time and remove any small, seedless berries which may have been overlooked. Make a careful examination of the foliage and dry corners of theinery for the presence of red spider. If laterals keep growing freely—the best proof of moderate cropping, pinch the stronger and allow the weaker to develop. Admitting a little air at night

is an excellent preventive of scalding, but the ventilators should be closed early in the morning to economise fuel and to favour the early re-opening of the ventilators for the day.

### HARDY FRUIT GARDEN.

By H. MARKHAM, Gardener to the EARL OF STRAFFORD, Wrotham Park, Barnet, Middlesex.

**Protection of Wall Trees.**—The short spell of hot weather in the middle of March caused the flowers of Peaches and Nectarines to develop rapidly, and if the weather continues very cold the blooms may need protection. In favourable parts good crops of these fruits are produced annually without the aid of much protection, and when the flowers are strong and perfectly dry a few degrees of frost would seem to do them no harm. On the contrary, if they are wet and not very strong, cold, cutting winds and 5° or 6° of frost are quite sufficient to destroy the greater part of the best flowers. The trees may be protected by two or three thicknesses of fish-netting fastened on to the top of the walls and kept at a reasonable distance from the trees by the aid of light poles sunk in the ground three feet from the bottom of the brick-work, with the upper end resting on the top of the wall. Each pole should be made secure to keep it in position in stormy weather. If the cold is very intense, I usually place, in addition to the netting, a few branches of Portugal Laurel at intervals all over the trees, and remove them so soon as the weather is more favourable.

**Figs.**—Young Fig trees growing in pots and intended to be planted outside, should have their roots thoroughly soaked with water before turning them out of the pots. Select a warm situation for these trees, and provide plenty of drainage when preparing the station for planting. The soil should be sweet and mixed with plenty of old brick mortar. Disentangle the roots, trim away the ends of any that are long, spread them out, and make the compost firm. Water the soil if necessary to cause it to settle firmly. Fig trees require ample room for extension in order that they may produce good and regular crops.

### THE FLOWER GARDEN.

By JOHN COURTS, Assistant Curator, Royal Botanic Gardens, Kew.

**Gladioli.**—The Gladiolus may be planted over a long season, extending from February to the beginning of May, the time of planting depending on the locality and nature of the soil, as well as the requirements of the establishment. From the end of March onwards may be considered the most suitable time. The soil should have been well prepared in advance of planting. On light, dry soils the corms may be planted direct in the ground, but on heavy, cold, wet soils it is wise to surround them with sand or start them in pots, hardening the plants off and putting them in their flowering quarters during May. Gladioli are very useful for associating with other plants, as their slender, upright growth does not interfere with the other subjects. They are specially useful for inter-planting with Paeonies and other kinds of early flowers.

**Cannas.**—These bold foliage plants are very effective, but as our summers are all too short for them, it is desirable to have well-grown plants ready for bedding out. The dry rhizomes should be taken from the store, divided, cleaned and placed in suitable-sized pots. If there is plenty of stock large clumps may be placed in six or seven-inch pots, and forty-eight-sized pots may be used for single crowns. They should be placed in a temperature of 60°. Very little water should be given the roots until growth is active.

**Sweet Peas.**—Seeds of Sweet Peas may be sown out-of-doors in sites previously prepared for them, while the plants raised indoors and carefully hardened off may be planted in their flowering quarters. Whether they are grown in clumps in the mixed border, or planted out in lines they should be set singly from six inches to twelve

inches apart. Sweet Peas transplant very easily even if all the soil is shaken from the roots. They should have some support from slender twigs, and in many districts it will be necessary to protect them from sparrows.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Hardening Plants.**—The time has arrived when many plants intended to be transferred to flower beds should be gradually hardened, and prepared for planting in the open. The sashes of the cold frames in which Pentstemons, Nepeta and Calceolarias are growing should be removed in the day-time, and on mild nights the frames may be ventilated freely, but mats or other

Spanish Irises, etc., may also be cultivated again freely. Where these last-mentioned have remained on the same site for a number of years, they will be greatly benefited by an application of some well-compounded manure pricked into the borders as the work proceeds, or a mulch of well-decayed manure may be spread on the surface where this would not be unsightly; where the bulbs have been recently planted and the soil is in good condition, this is not so necessary.

**Rose-pruning.**—The pruning of Roses may now be safely performed in most districts, and should be attended to immediately; in pruning for the production of large, individual blooms, the plants should be shortened severely leaving only two or three dormant buds to develop, each of which will produce a cluster

FIG. 112.—NARCISSUS TREGOOSE.

R.H.S. Award of Merit (for show purposes), March 22. Flowers yellow and orange. Shown by Mr. P. D. Williams, Lanarth, Cornwall. (see p. 220).

protective materials should be ready at hand for use if a drop in the temperature threatens. Early Potatoes are well advanced also, and they should be protected, or a few degrees of frost may ruin the crop, although few other plants are capable of making such a rapid recovery from damage by frost as the Potato. Peas and Cauliflowers, which have been raised under glass, should be set in a sheltered corner outside where, in emergency, they may be given protection if found necessary.

**Spring Bedding.**—The beds and borders occupied by spring-flowering plants should have the surface soil stirred lightly, as it has become beaten down by the winter rains. Where such bulbs as Tulips, Hyacinths, etc., are largely planted, it has been difficult to do this earlier without damaging the growing shoots. These are all well above ground now, and the work may be done both expeditiously and safely, while borders filled with May-flowering Tulips,

of flower buds, which should be thinned to one bud. Where the Roses are grown for garden effect much less severe pruning is required and the shoots may be left with several dormant buds, according to the variety. In both cases all old and bark-bound wood should be first removed, and a selection made of the best of the young shoots at the base, reducing these in accordance with the object of the cultivator. These remarks apply to Hybrid Perpetuals, Hybrid Teas, and Tea or Noisette Roses, but there remains a large family of Roses which may be treated less severely with excellent results. These include the Provence and Moss Roses, the Damask Rose, the Chinese or monthly Rose, besides a number of stronger-growing species, such as *R. sericea pteracantha*, *R. Moyesii*, *R. rugosa* and *R. rubrifolia*, all of which are delightful subjects for the wild garden, and may be allowed to grow naturally, removing only old and exhausted wood in order to allow more room for the younger flowering shoots.

## HARDY FLOWER BORDER.

### CHELONES.

THE Chelones are now mostly included under *Pentstemon*, but they are best known by their old names in most gardens. Of the true Chelones there are two species offered by the trade, and both of these make good and distinct garden plants for the herbaceous border. They are not difficult to cultivate in any good border, and form a distinct feature with the majority of the hardy plants of summer, when they bloom. *Chelone Lyonii* will attain to a height of about two feet, but I have never seen it quite so tall.

It produces purple-red flowers and is a capital subject where the less common hardy flowers are appreciated. The other species is *C. obliqua*, which also blooms in summer, and its flowering period extends into autumn. *C. obliqua* is about three feet high and its flowers are of a good violet-purple. There is also a pretty white variety, *C. obliqua alba*. These Chelones are increased by division or by seeds, when these can be obtained. I saw those of *C. Lyonii* but not of *C. obliqua* offered last year. Division of good-sized plants in spring or after flowering is past in autumn, is easily and safely performed. These good hardy flowers may be considered by all who are intending to add plants to their gardens this spring. *S. Arnott*.

## ALPINE GARDEN.

### ALYSSUM SERPYLLIFOLIUM.

*ALYSSUM saxatile*, the Rock Madwort, or Gold Dust, is a greatly prized plant for the rock garden, and the genus includes a few other choice alpinists of which *Alyssum serpyllifolium* is one of the most beautiful. It comes near to *A. alpestre* and *A. bracteatum*, but is, I consider, the best of the three. It is quite prostrate, with miniature, grey, Thyme-like leaves, and small, rather pale, yellow flowers, which harmonise so well with the soft grey of the foliage.

It does best in a rather dry, sandy soil and should be planted on a flat or on a slightly sloping terrace or other place in the rock garden, a little below the level of the eye. It is a small plant I have known and loved since I first raised it from seeds some thirty-five or forty years ago. Seedlings are very easily raised from seeds sown under glass in spring. It may also be propagated by cuttings.

Plants may be purchased in spring and planted out in March or April to flower later in the season. It is a native of Spain, Mont Cenis, etc., and is perfectly hardy and perennial. *S. Arnott*.

### SAXIFRAGA IRVINGII.

THE Cushion section of the genus *Saxifraga* includes many choice subjects for the rock garden but few excel the delightful Rockfoil under notice.

It appeared at Kew in 1909, and is of hybrid origin, the parents being *S. Burseriana macrantha* and *S. thessalica*. It is a free grower, forming neat, little tufts, which, when in bloom, rarely exceed an inch in height. The popularity of this Saxifrage is due, to a large extent, to its free-flowering, and the pretty shade of the flowers. The latter, when first open, are a pale rose-pink, but with age they become white. So free is this plant in the production of its exquisite blossoms, that the small rosette or cushion is hardly visible.

*S. Irvingii* is at its best in March. In these days, many alpinists are grown in pans, and although they are kept in the open the greater part of the year, they are introduced to the alpine house or cold frame for the flowering period. This Rockfoil is, indeed, a gem for this purpose, but it is also amenable to cultivation on the rock garden. It is a good plan to divide the stock, where this is possible, between the alpine house and rock garden, as this will prolong the flowering season.

A well-built rock garden will furnish the number of sites for *S. Irvingii* and similar subjects: a spot facing east or west, where plenty of air can reach the plant, is best suited to this charming Rockfoil.

Well-drained soil is essential, and the rooting-medium requires plenty of sharp grit added to it to allow water to drain away quickly; plant it to allow cuttings should be rooted firmly. A few cuttings should be rooted annually to maintain a healthy stock. These will form roots in a shaded, cold frame, if placed in small pots containing sandy soil, and the best month for propagating is June. Old plants may also be lifted and divided a few weeks after they have flowered. *T. W. Briscoe*.

### HACQUETIA EPIPACTIS.

THIS is a useful hardy and desirable plant, flowering during early spring, and suited to a cool, partially shaded corner of the rockery, where its close tufts of pale green foliage and quaint, button-like, golden-yellow flowers rest peacefully on the foliage. *W. Logan*.

## BOG GARDEN.

### BUTOMUS UMBELLATUS.

Few other of our native plants are more suitable for planting in the water garden, by the margins of lakes or along stream sides, than *Butomus umbellatus*, the Flowering Rush. It belongs to the Natural Order *Butomaceae*, although it is nearly related to, and is often included in *Alismaceae*.

It occurs wild throughout Britain rather locally, and is found growing in the water in ditches and at the sides of rivers and ponds.

Propagation is readily effected by division of the rhizomes. The Iris-like leaves are two or three feet long. The flowers are borne in umbels of twenty-five to thirty at the end of long stems in late summer, and are rosy pink in colour.

### LYSICHITUM CAMTSCHATCENSE.

THIS beautiful hardy Aroid is useful for planting in the bog garden or close to the margins of a pond or lake.

The large leaves are produced from a thick, horizontal rootstock. In early summer the plant produces its inflorescences, each consisting of a stout flower-stalk, from six inches to twelve inches long, and rendered conspicuous by the very showy, bright yellow spathe.

It is easily propagated by means of offsets. A white variety is also in cultivation, but is not nearly so hardy as the type. *T. H. Everett*

## FLOWER GARDEN.

### ANNUALS.

WHEN the ground is in good working condition, the opportunity should be taken to commence sowing seeds of hardy annuals. A special display of annuals may be made in the beds and borders especially set apart for them, and they are also invaluable for giving variety and filling vacant spaces in the herbaceous or mixed border.

Success with this class of plants—apart from proper soil conditions—depends very largely on thin sowing, and perhaps most important of all, early and drastic thinning. There is no comparison between weak and weedy plants resulting from overcrowding and those of the same species or variety that have been adequately thinned and thus allowed to develop to their fullest extent. Annuals generally are best grown on ground that has been deeply tilled, but a large amount of manure is not needed.

Half-hardy Annuals are usually sown indoors, but most of them may be grown successfully, especially in the south, from sowings made out-of-doors, provided the sowing is deferred until the end of April or the beginning of May. In dealing with half-hardy annuals indoors, many cultivators make the mistake of sowing too early, with the result that the plants often get spoiled before it is possible to get them out into their flowering quarters. Much better results are obtained from putting out quite small, healthy plants, which become established quickly, and in the end, give a much better

display of flowers than larger plants that may have been spoiled by overcrowding. About the middle of March is a good time to sow annuals indoors. *J. C.*

### SALVIA HARBINGER FROM SEED.

FOR years *Salvias*, particularly the dwarf, scarlet, bedding variety, *Glory of Zurich*, were raised by cuttings obtained from stock plants. In some seasons the stock plants were a source of danger in greenhouses as they are prone to attacks of red spider and act as hosts of the pest during the winter. For some years past I have grown the variety *Harbinger* from seeds and ceased to keep stock plants.

This *Salvia* will produce a good quantity of seeds, and it is an easy matter to secure an ounce or two from a bed of good plants. The seeds are best sown in sandy soil early in spring in the warmest place available, directly over the water pipes, or plunged in a hot-bed. The seedlings are not much addicted to damping off, and after pricking them out into boxes they should be placed in a warm, close house near the roof-glass. I have tried large, sixty-sized pots, also planting for the next shift in large boxes, three inches deep, and I find the box treatment gives the better result. The plants should be placed about five inches apart, and grown in soil consisting of loam and leaf-mould in equal portions, with a liberal quantity of sand. When they are well on the move, the hardening of the plants may be done fairly quickly.

I have in mind a circular bed here near the main road which contained 120 plants of this *Salvia* put out eighteen inches apart early last May, and from July to October this bed was a magnificent sight and a source of great interest to passers-by. The edging was a thin line of the grey-foliaged *Mrs. Sinkins Pink*. The bed by mid-August was one mass of bright green foliage topped by a blaze of scarlet. *G. W. Stacey, Chorleywood Cedars*.

## BULB GARDEN.

### TIGRIDIAS.

ALTHOUGH well-known, *Tigridias* are not grown so frequently as their merits deserve, for though their blooms last only about a day in perfection, they are singularly beautiful, and are borne in such quick succession that this defect may be overlooked.

*Tigridias* are not perfectly hardy, and though they may survive mild winters, are best lifted when the leaves die down in October, stored in sand, or tied in small bundles, and hung in a cool, airy, frost-proof place until the spring.

A sunny, sheltered situation suits them admirably, and they require a rich, well-drained soil. If a bed is specially prepared for them, the soil should be dug out to a depth of twenty-four inches, and about six inches of brick rubble placed at the bottom for drainage. Over this should be placed equal parts of rich loam and leaf-mould, with a little sand, thus making at least eighteen inches of good soil.

The bulbs may be planted three inches deep and six inches apart, placing a little sand under and around each. In dry weather they should be well watered, especially if this sets in before the foliage is well developed, in order that the plants may become strong before the flowering period, which is from about mid-summer until September. For ordinary culture a sheltered, sunny border, with a depth of at least eighteen inches of rich, well-drained soil, will suffice, but they will repay special treatment by flowering continuously and profusely for about two months.

The species commonly grown is *T. Pavonia*, with flowers about five inches across, gleaming in scarlet and orange, and shaped somewhat like those of an Iris. There are numerous beautiful hybrids, with flowers of brilliant hues, which include varied tints of creamy-white, yellow, crimson and purple. Most of them are self-coloured on the outer part of their broad, lower petals and deeply spotted in the middle. This quaint mottling and the rather curious shape of its flowers give the *Tiger Lily* a distinctive charm and render it worthy of a place in gardens. *James A. Paice*.

SEEDSMEN BY APPOINTMENT

# Carters

## TESTED SEEDS

### LAWNS

All Lawns should be reconditioned immediately if the turf and surface are to be in good condition for the coming season.

For particulars how to renovate your lawn, make a new Lawn, etc., write to-day for Carters Booklet on Lawns, post free on application.

**CARTERS SPECIALTIES FOR YOUR LAWN**

Carters Finest Grass Seed ensures a beautiful healthy sward in the shortest time. Carters Worm Killer an infallible remedy for killing Worms. Carters Grass Fertilisers to restore worn Lawns. "Carterite" for the destruction of Daisies and other shallow-rooted Weeds.

Full particulars and prices contained in Carters booklet on Lawns, post free on application.

## CLIMBING PLANTS

March and April are good months for putting out all Climbing Plants because, the rigours of winter being past, even tender varieties will have every chance to become established before another winter.

Clematis, Ceanothus, Ampelopsis, Vitis, Euddleia, Escallonia, Wistaria, Polygonum, Jasmines, Honey-suckles, Ivies and a great many less known climbers are grown by us in large quantities and of superior quality. All are grown in pots to ensure safe transplanting, but they are reared under such hardy conditions that they lose no time in adapting themselves to their permanent quarters, whether bleak or otherwise.

*Our Illustrated Catalogue of Climbing Plants and Roses will be sent post free.*

## A CLEVER INVENTION FOR RAISING WELL WATER

The Boulton Water Elevator lifts a continuous stream of water from wells of any depth. No pipes no valves or suckers—cannot freeze. Can be fixed within an hour without skilled labour. Thousands in daily use.

Write for Catalogue No. 768.  
Boulton & Paul, Ltd. Norwich.

## INDOOR PLANTS.

## LACHENALIAS.

THE Lachenalias are natives of South Africa. These bulbous plants are simple in their requirements and suitable for growing either in pots, pans or baskets. They make a pleasing display in the early months of the year. They should be potted towards the end of July or early in August, placing five or six bulbs in a five-inch pot. The compost should contain a little dried cow manure and sufficient sand in accordance with requirements. After potting them, place the plants in a cold frame. It is advisable not to water them until moisture is absolutely necessary, but they should be shaded and sprayed overhead occasionally until top growth appears, when every endeavour should be made to promote sturdy growth.

Where space is available during the winter in a cool house, the plants may be grown on a shelf or in some similar position near the roof-glass where the temperature does not fall below 35°.

Lachenalias thrive under cool treatment, but may be forced slightly when the flower spikes have developed. Watering should be done sparingly until the plants are growing freely, when copious supplies of moisture will be necessary until the foliage shows signs of dying down, when water should be withheld gradually.

The plants will be benefited by liberal feeding when the roots have filled the pots, especially during the period between the flowers fading and the foliage showing signs of ripening. When the plants are completely at rest place the pots on a shelf in full sun where they will derive benefit from a thorough baking. Varieties vary considerably in the rate they increase; fortunately, many are very prolific in this respect.

During the past few years considerable progress has been made in the development of new varieties, mainly due to the efforts of the late Rev. Joseph Jacob, the latest introductions being a decided advance over some of the older kinds, such as *tricolor* and *Nelsonii*.

*Lachenalia pendula* L. p. *superba* and *L. Boundii* comprise a distinctly early section commencing to flower about Christmas, even under cool treatment. These three Lachenalias are distinct, yet all alike have bright vermilion-coloured flowers, the tips of the bells tinged with green. The variety *pendula superba* flowers a little earlier than the other two.

Next in order of flowering is *Spa*, bearing beautiful, rich yellow flowers, slightly flushed with red. This variety is followed quickly by what may be termed the maincrop varieties which are at their best in March, and are represented by the following: *Canada*, pale primrose yellow, tips tinged green, one of the palest of this colour; *Thibet*, of a brighter shade of yellow than the last named; *Africa*, a variety of robust constitution, bearing orange-yellow flowers brightly tipped with red; *Calcutta*, another strong grower similar to the last, with the difference of the tips being a dull crimson; *Leiden*, a very distinct variety in its flower formation, the bright orange flowers being widely spaced on tall stems, which are dull brown; *Arabia*, with large, pale Primrose flowers, tipped with green, one of the best of its colour; *Tipperary*, one of the latest to flower, a blend of yellow, red and green shades, and *Mandalay*, bright orange, slightly flushed red, the bells being rather large.

When these newer varieties are better known interest in these somewhat neglected plants will be greatly stimulated. J. W.

## LACHENALIA NELSONII.

THE successful cultivation of *Lachenalia Nelsonii* is a very simple matter, provided the plants receive due attention at the proper time. So soon as the flowers fade, the flower-spikes should be removed and the plants placed on a shelf near the roof-glass in a vinery or Peach house. Here they should be kept well-watered and supplied with liquid manure twice a week until the leaves begin to turn yellow. So soon as this occurs, cease feeding and gradually reduce the water supply for two or three weeks, and then

discontinue watering. Leave the tubers in the pots on the shelves, and subject them to a thorough ripening.

Towards the end of July the tubers should be shaken out of the pots and graded. Place nine or ten in a forty-eight-sized pot, using a compost of three parts good yellow loam to one of leaf-mould, with a good sprinkling of silver sand and a little bone-meal. Pot fairly firmly and place the stock in a cold frame. Afford shade to the pots from bright sunshine until growth appears, when the plants should receive all the light possible. During bright weather a light spraying of water, several times a day, will encourage growth. Carefully supply water to the roots and keep the plants cool, but guard against frost. In November, place the Lachenalias in a greenhouse, in a temperature of 45° to 50°. The accompanying photograph (Fig. 113) was taken on February 22, 1927. Wm. Holden, Woburn Place Gardens, Addlestone.

darker as the season advances; it is a very charming Maple. *A. palmatum dissectum* has foliage distinctly Fern-like in appearance. The young growths are long, slender and pendulous, and like the leaves, coloured deep crimson, the young foliage being especially handsome. *A. palmatum ornatum* is similar to the above, but of a brighter hue; the foliage is more finely-divided than in the variety *dissectum*. *A. palmatum septemlobum elegans* has seven-lobed leaves, of a reddish hue, turning in autumn a rich amber-yellow and crimson. The leaves are deeply serrated when young, and margined with delicate rose. In *A. japonicum aureum* the leaves are a soft pale yellow with rose-coloured foot-stalks and nerves; they are palmately divided into ten or twelve lobes, fan-shaped in outline and glabrous on the upper surface.

*A. japonicum laciniatum* has the foliage cut into deep lobes, giving the leaf a Fern-like

FIG. 113.—LACHENALIA NELSONII AT WOBURN PLACE, ADDLESTONE.

## TREES AND SHRUBS.

## ORNAMENTAL MAPLES.

THE many varieties of *Acer palmatum* are amongst the most beautiful of hardy trees with ornamental foliage, which in many of the forms is finely serrated.

Borders and large beds planted with Japanese Maples add rich colour to the garden, especially in early summer, when the leaf-colouring is most pronounced. The type is a compact tree with five-pointed leaves, of a bright, lively green, and numerous small branches which are almost hidden by the wealth of foliage.

*Acer palmatum sanguineum* and *A. p. atropurpureum* have elegant, exceedingly neat foliage, dazzling in colour, especially, lit up by the sun. The variety *sanguineum* may be distinguished from *atropurpureum* by the red bark of its young wood and the green under-surface of its leaves.

*Acer palmatum roseo-marginatum* has prettily marked foliage; the leaves are divided into leaflets, three to five in number, light green in colour, marked along the margin with a narrow, irregular band of rose-colour on white.

*A. palmatum ampelopsifolium* is another elegant form, with gracefully-arched branches and leaves resembling those of the Virginian Creeper, but smaller and more delicate in texture. Their colour is deep crimson, the tone becoming

appearance. The leaves turn a rich claret-purple in autumn, relieved at the tips by yellow.

*Acer nikōense* is a beautiful and remarkable Maple, noteworthy for its hairy, trifoliate leaves of brilliant tints in the autumn. When first developed the leaves are of a reddish-bronze hue, changing as they mature to a deep Pea-green above, and a distinctly glaucous hue beneath. In autumn the foliage assumes a most brilliant scarlet which is not surpassed in beauty by that of any other foliage tree.

*Acer Davidii* is a very fine species attractive in winter; the leaves grow eight inches long and are five inches wide. When first produced they are of a reddish-bronze tint, changing later to a deep, shining green, with strongly-marked veins of yellowish-green. The bark is striped with white, making it a valuable ornamental tree for winter effect. This species grows to a height of fifty feet in its natural habitat. *A. laetum* is a small-growing Acer with green foliage, marked bright rosy-pink. The plant is a compact grower and makes an elegant shrub for the back of the rockery. *Acer Fargesii* is dwarf and slow-growing and requires a sheltered situation. The leaves are leathery in texture, and when first produced are of a bright crimson colour. The keys, which are abundantly produced, are coloured bright crimson.

Acers grow best in a loamy soil mixed with plenty of leaf-mould and a few small lumps of charcoal. G. L.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the **PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.**

**Letters for Publication** as well as specimens of plants for naming, should be addressed to the **EDITORS, 5, Tavistock Street, Covent Garden, London.** Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notices printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the **PUBLISHER** and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the **EDITORS.** The two departments, **Publishing and Editorial,** are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Special Notice to Correspondents.**—The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

## THE NEWER CONIFERAE.

THE British Isles are singularly poor in indigenous species of Conifers. They number only three—the Scots Pine (*Pinus sylvestris*), the Yew (*Taxus baccata*) and the Juniper (*Juniperus communis*). Of these only the first can be considered a timber tree of economic importance. The Larch (*Larix europaea*) and the Norway Spruce (*Picea excelsa*) have been in this country so long—roughly three and four centuries respectively—and are such familiar objects of the landscape as to appear native, and are, no doubt, often assumed to be so by the uninformed. The Silver Fir of Central Europe (*Abies pectinata*), though not so commonly seen, is yet of old establishment, having been planted in this country since the beginning of the seventeenth century.

We may speak of the above, viz., the Scots Pine, European Larch, Norway Spruce and the Silver Fir, as constituting the older Coniferae, from the foresters' point of view; and compare them with the Corsican Pine (*Pinus Laricio*), Japanese Larch (*Larix leptolepis*), Sitka Spruce (*Picea sitchensis*), the Giant Silver Fir of Pacific North America (*Abies grandis*), and in addition the Douglas Fir (*Pseudotsuga Douglasii*), as constituting the newer Coniferae, since none of these was introduced before the nineteenth century, and all may yet be said in varying degrees to be on their trial as timber trees for this country.

Since the war, afforestation by the appointment of the Commission, has at last been taken up in earnest, and extensive areas are being planted, chiefly with Conifers. Criticism of a two-fold character has been forthcoming—the neglect of the hardwoods and over-confidence in the newer Coniferae. The former is unavoidable as the land that can be acquired is for the most part only suitable for Conifers. I trust, however, that in the Crown forests, and wherever conditions are favourable, efforts will be made to increase our broad-leaved trees, especially Oaks and Ashes which through the war suffered a serious depletion. Regarding the second criticism, time alone will show its justification. Webster, two years ago, in an article on the Government Forestry Policy (*Gard. Chron.*, LXXVII, p. 186, 1925) took up a conservative attitude, disparaging the new Coniferae and extolling the Scots Pine, Larch and Spruce.

My purpose in writing this article is not to attempt any expert discussion of the timber value and silviculture of the newer Coniferae, matters upon which I can lay no claim as an authority, but rather to offer some remarks on the distinctive features, aesthetic effect, requirements as to soil and situation and

incidentally, probable economic worth of these trees, as compared with the older Coniferae, having in mind the small property owner who may be desirous of planting up limited areas for the sake of shelter, amenity and ultimate usefulness. Unless he be very conservative he will naturally be drawn towards the newer Coniferae and if ignorant of their peculiarities, may easily put a good tree in a wrong place. Anything I have to state is gleaned largely from twenty years' personal observation in the north-west of England; consequently, my remarks apply especially to this part of the country, and also to a soil overlying the Triassic red sandstone.

## PINES.

The large genus *Pinus* offers few species of economic importance for this country, and taken on the whole, our native tree is not easily surpassed. In decorative effect it is, in my opinion, far superior to the Corsican Pine, its only serious silvicultural rival. The fine contrast of its blue-green foliage with its red bark is not equalled, I fancy, by any other species. It is easily raised and transplanted, is fairly accommodating as to soil, though, like most Pines, it is happiest on light soils and gives its best colouring under such conditions.

FIG. 114.—BOLE OF JAPANESE LARCH SHOWING PROTRUDING ROOTS.

The Corsican Pine is superior to it in rate of growth and straightness of bole, and provided its timber meets with favour, will furnish a greater bulk in a given time. The general impression is that it is later in forming heartwood than the Scots Pine, and is thus longer in maturing timber of good quality. It is by no means so easily raised and transplanted to permanent quarters. Care has to be exercised, otherwise deaths may be many. Late spring is the best time for moving it. The Scots Pine may be planted any time during the winter—in fact, from October to May, inclusive—with little chance of failure. One point in favour of the Corsican Pine is its immunity from injury by rabbits. They not only discriminate between it and the Scots Pine, but also between it and the Austrian Pine, which they greedily devour. This is remarkable considering that botanically the Corsican and Austrian Pines are reckoned to be varieties of the same species. To the forester and arboriculturist they are distinct. The Austrian, on account of its shorter annual growth and longer retention of its needles, makes a much denser tree. In the nursery the two Pines are readily distinguished by the character of the needles, twisted in the Corsican, and straight in the Austrian.

Aesthetically the Scots Pine does not mingle well with any of the forms of *Pinus Laricio*. If the Scots and the Corsican Pines are to be inmates of the same plantation, then I should suggest planting the former on the outskirts, allowing the centre of the wood for the latter. On the other hand, the two varieties of *P. Laricio* do blend well, having needles of the same degree of coarseness. Here again, the

one, the Austrian, should be planted on the outside, and the Corsican within. If intimately mixed, the latter will soon outgrow and eventually suppress the former. The Austrian Pine affords much better shelter and ampler verdure, and for these additional reasons should be the marginal tree. These two Pines are eminently suitable for forming a protective coast belt. They withstand the sea blast much better than the Scots Pine. The Austrian Pine should be planted seawards, then the Corsican Pine, reserving wholly or partly the landside for the more beautiful and attractive Scots Pine. For calcareous soils *Pinus Laricio* must be selected, as *P. sylvestris* does not take kindly to lime; also the former is more suitable for clays. In fact, *P. Laricio*, in its various forms is a wonderfully accommodating Pine, and thus, in spite of its coarseness and sombre appearance, is to be welcomed in positions where the Scots Pine will not flourish.

## LARCH.

The Japanese Larch, from every point of view, is proving itself one of the best Coniferous introductions of the last century. Just as arboriculturists were lifting up their hands in despair over the proneness to canker (*Dasycephala calycina*) of the European Larch, the Japanese species came along, as it were, to the rescue. So far, it has proved itself well nigh immune. In my experience here, it is absolutely so, up to date. The two are growing in intimate association. The European Larch is badly blistered, but there is not a suspicion of disease on the Japanese Larch, even on suppressed trees barely maintaining life. This Larch has not yet been long enough with us to pronounce on the value of its mature timber as compared with that of the European type. The general opinion is that it will prove inferior. In its youth it is a more rapid grower and is capable of producing pit props, useful poles and fencing material in the short space of ten or twelve years, but one has doubts of the durability and strength of this quickly-grown Coniferous timber. The best tree of a grove planted by the writer twenty years ago on alluvial gravel by a stream, has at present a girth of thirty-nine inches at four feet from the base, an approximate height of forty-eight feet, and probably contains ten or more cubic feet of timber. A companion tree recently felled measured three inches less in girth, contained eight-and-a-half cubic feet, and was forty-five feet high. The original leader had suffered a mishap two years ago, and this had probably dwarfed the tree a couple of feet. This tree is fairly well hearted, the heartwood extending outwards for about fourteen annual rings.

The Japanese Larch is readily distinguished from the European by the rich colouring of its bark. It is this feature that makes it so distinctive in winter. A slope given up to Larch should, for aesthetic effect, be planted with the Japanese kind on the lower and the European species on the upper parts, with no sharp line between the two; then in winter there will be a pleasing colour gradation upwards, from warm brick-red to pale yellow-brown. A breadth of young Japanese Larch above a covering of snow is an appealing sight.

The leaves of the Japanese Larch are broader and somewhat glaucous, approaching blue-green in colour, and its branches are stouter and more widely flung than those of the ordinary Larch. As a specimen tree it thus requires more room; but silviculturally it may be advisable to plant it more closely than the common Larch in order to kill off the laterals early for clean timber, especially as it is not so intolerant of shade. The tree, when of some age, and when growing under forestry conditions, is not so readily distinguished from the European Larch, but an expert has little difficulty in "picking it out" from the appearance of its trunk. The bark is redder and more flaky as a rule. It is also more inclined to protrude its roots from the base of the bole (see Fig. 114).

It is less wind-resisting than the ordinary Larch, and more trees are apt to become flat-topped. It needs more moisture and so is not suitable for planting in soils which become at all arid for a time in summer. Plant it, therefore, where it has shelter, abundance of

## NOTES FROM KEW.

moisture, and at the same time good drainage, and avoid, if possible, frost holes. Its new growths are more sensitive to spring frosts than those of the European Larch, or it may be that it is rather earlier in coming into leaf. In a frosty hollow it is apt to get much crippled in its youth, though eventually it will fight its way up, but probably with a crooked stem. From my observations, I should say it sheds its needles a little earlier in the autumn. It is quite as effective, if not more so, at this season of the year than the common Larch.

To sum up, it is a delightful tree for the arboriculturist, and sylviculturally is easily managed, though the forester may have present at the back of his mind the thought that it may ultimately not be so acceptable to the timber merchant or the estate agent. Presumably, it is never likely to reach the stature of our common Larch. Have any systematic observations been carried out to see whether *Larix europæa* from native seed is less liable to canker than that raised from Continental seed? A few Larches raised here from locally collected seed suggest that they make healthier trees.

## SPRUCE.

The Sitka Spruce has come to stay, for four good reasons: It is a quicker grower, stands the wind much better, thrives on wetter ground, and produces timber of higher quality than the common (Norway) Spruce. But there is room for both, and especially aesthetically. The ordinary Spruce is still assured of its wonted place at Christmas. The Sitka is no rival here. It is too prickly and too meagrely furnished with branches. There is no other Spruce, or Conifer, in fact, so suitable as a Christmas Tree as *Picea excelsa*. The Sitka Spruce also, one imagines, would be a poor substitute in game covert. In fact, as an amenity tree the common Spruce is not easily superseded by any other species of *Picea*; but variety is desired, and the Sitka affords this through not only being different in habit but also in colour—glaucous green foliage in contrast to the pure green of *Picea excelsa*. The prickly character of its needles renders it unattractive to rabbits—an advantage.

To be a complete success the Sitka Spruce must have an abundance of moisture available in the soil. On dry ground it is apt to shed its needles too early and so to wear a lean look in winter. It is almost intolerant of shade, and thus is more easily suppressed than the ordinary Spruce. Trees weakened in this way recover rapidly on the removal of the shade. It is especially valuable for planting in boggy land where the Norway Spruce is incapable of flourishing.

The young shoots of the Sitka Spruce are very sensitive to frost, and as it is early in putting forth its new growth it is apt, in its youth, to suffer badly from late spring frosts. The new leader may be entirely destroyed in this way, and though a fresh one will usually be produced, an ugly kink results in the main stem which spoils the timber at the pole stage. Ultimately, this will disappear as maturity approaches. Since swampy places are often low-lying, constituting frost holes, there is this sensitiveness to contend with in planting Sitka in these situations. It has, however, such vigour that it is rarely killed outright by spring frosts, unless it happens to meet with an extra stiff late frost just after being planted. Its annual growths are often three to four feet in length, so that, with luck, it soon rises above the frost zone. The young shoots of the ordinary Spruce are also sensitive, but it is later in bursting its buds, and only rarely, therefore, does the leader suffer. Is it past the wit of man to produce late-shooting strains of both species? Individual plants vary inherently in this respect. I have noticed this markedly in the case of *Picea excelsa*. In fact, trouble has been taken to select slow-moving plants in the nursery for frosty situations.

A valuable feature of the Sitka Spruce is its resistance to wind; it may, therefore, be planted in exposed situations, where the ordinary Spruce would be liable, owing to its shallow root system to be uprooted in a gale. J. Parkin.

(To be concluded.)

INCLUDED in the large *Prunus* family, which at Kew includes *Amygdalus*, *Cerasus* and *Lauro-cerasus*, is a considerable number of useful, early, spring-flowering trees and shrubs. *P. subhirtella* var. *autumnalis* (syn. *Miqueliana*) has been producing a succession of blossoms during mild spells of weather for some five months, and is still very attractive. The Rosebud Cherry, so long cultivated in gardens as *Prunus pendula*, is placed by Wilson in his Monograph of *The Cherries of Japan*, following Tanaka, as a variety of *P. subhirtella*, this nomenclature being followed in the new *Hand*

seeds were from cultivated trees. There are forms with pure white and also rosy blossoms.

Several varieties of the Almond, *P. Amygdalus* (syn. *Amygdalus communis*), are a conspicuous feature in various parts of the garden, particularly in the neighbourhood of the Temperate House. The first to flower, a fortnight or three weeks in advance of the type, is the variety *persicoides* (also grown as var. *praecox*). The flowers are a shade or two lighter than those of the type. Against a background of evergreen trees, masses of the rich rosy blossoms of the type, especially on first opening, are most attractive. The variety *alba* has large, pure white blossoms. A variety known as the Richmond Park Almond, because the stock came from a tree growing in Richmond Park,

FIG. 115.—SOPHRO-LAELIO-CATTELEYA MIKADO.

R.H.S. First-Class Certificate, March 22. Flowers apricot, pink and ruby. Shown by Baron Schröder, Dell Park, Englefield Green. (see p. 219).

*List of Trees and Shrubs.* Flowering early, it is often damaged by frosts, but this year, favoured by mild weather, the gracefully weeping branches are festooned with the small, pale-rose blossoms. A tree at the foot of the hill near King William's Temple, some ten feet high, with spreading and pendant branches nearly to the ground, is particularly attractive.

*P. Davidiana*, which sometimes opens its first blossoms by mid-January, was a month late in starting this year. The flowers of some at least of the trees raised from seeds sent home by recent collectors from China are not so large and attractive as the original stock introduced by the Abbé David to Paris in 1865. He stated at the time that "the tree made a beautiful and conspicuous feature in the vicinity of Pekin." This suggests that the Abbé David's

has large white blossoms, two inches across, not perhaps quite so pure white as the variety *alba*, but the individual flowers are larger. The variety *macrocarpa* is a vigorous tree with soft rosy blossoms, so named because of its large Almond fruits.

Numbers of trees of the Cherry Plum or Myrobalan, *P. cerasifera*, are covered with pure white blossoms. In gardens to-day the variety *Pissardii* is very extensively planted and is much more attractive than the type, having red foliage and tinted blossoms. A number of varieties or hybrids have found their way to this country from the continent. One of the first, named *Blireiana*, has purple foliage and semi-double, rose-pink blossoms. Moseri is a rather deeper shade of rose-pink, also semi-double. Both are flowering very freely at

Kew this year. Two other varieties, more recent additions to the Kew collection, are variety *nigra* with very dark red-purple foliage, and *Hazledene* variety. In general appearance large trees of *P. divaricata* are very similar to the *Myrobalan*, but the fruits are yellow, those of *P. cerasifera* being plum-colour.

*Prunus tomentosa* is a common Chinese shrub, four feet to six feet, occasionally more, in height, and as much, or more, in diameter. The flowers are small, not more than three-quarters-of-an-inch across, but very freely produced in March, white or with a slight tinge of pink.

The Japanese Plum, *Prunus salicina*, perhaps better known in British gardens and nurseries as *P. triflora*, is a very showy tree with masses of white blossoms. Though first introduced from Japan, where it is extensively cultivated, the tree is only known in a wild state in China, several trees raised from seeds sent home by Mr. E. H. Wilson being at the present time covered with blossoms.

The semi-double-flowered varieties of *P. Mume*, the Japanese Apricot, blossom about the same time as the Almond. The variety *flore roseo pleno* has rich rosy-pink blossoms and *flore albo pleno*, pure white, semi-double flowers. Rather more liable to damage by wind and white frosts than many *Prunus*, *P. Mume* should have a sheltered position.

The newer Chinese Cherries, *P. pilosiuscula* and vars. *barbata* and *media*, *P. Conradinae*, *P. incisa*, *P. consociiflora* and *P. yedoensis* are all represented by attractive flowering specimens. A. O.

## THE BLUE PRIMROSE.

THESE notes have been prompted by reading a recent article on the "Genetics of the Wisley Blue Primrose," by B. Buxton, F.L.S. (*Journal of R.H.S.*, vol. LI, p. 305).

The author states that since the natural colours of the Primrose are yellow or red, the blues now cultivated are a recent mutation, probably due to the germ cells becoming damaged in some way, owing to over stimulation in cultivation and in consequence, have lost the power of excluding the K/ions or other alkaline ions of the sap and the blue cells admitting them.

Is this so, or is the origin of the blue Primrose to be sought in hybridisation?

So much has been done in this field since the appearance of the first blue Primroses that perhaps other readers may express an opinion as to their origin.

What is known of the first blue Primroses?

The late Mr. G. F. Wilson of Wisley exhibited in 1878 (Scott-Wilson) a Primrose of Tyrean purple, or purple with violet shades, and it was not until April 8, 1890, that he was able to show a blue Primrose, a seedling from Scott-Wilson (*Journal R.H.S.*, vol. XII., pp. 43 and 46). Mr. Wilson left no records of the origin of Scott-Wilson.

The late Mr. Richard Dean of Ealing was another of the first raisers, and we do not know his method.

The late Max Leichtlin, of Baden-Baden stated that he used the old blue Polyanthus.

After the production of the first blue or purplish-blue Primroses, the late Mr. Anderson-Henry wrote, that in his garden at Woodend, Madderty, Perthshire, blue Primroses grew freely and were also common in the gardens around. Inquiries were made three years ago whether blue Primroses were still found there; the only coloured ones found were sent here and were the usual red and lilac forms of the common Primrose. What had caused the blue Primroses to disappear? Mr. McAra, a former nurseryman in Crieff, probably supplied the information. He said that, forty years ago, the old blue Polyanthus grew plentifully in his nursery and in many gardens in the Strathearn district. The original plants were brought home by Thomas Graham, of Balgowan (created Lord Lynedoch for services in the Peninsular war), collected during his travels.

Would the old blue Polyanthus in that

district not account for the blue Primroses as in Leichtlin's case?

The blue Polyanthus has long since died out in that district; Mr. T. Hay, Hyde Park, London, informed me that he remembers it well.

What was the old blue Polyanthus? Was it *Primula elatior coerules* as mentioned in *The Garden*, May 3, 1879, p. 365, or was it *Primula amoena* (Bieb.)?

"The latter was introduced into Britain in 1831. It has a scape three inches to four inches high and an umbel of violet-blue flowers. It flowered in 1833 in the garden of the late Dr. Neill at Canon Mills, Edinburgh (of which a figure appeared in *Bot. Mag.* of that year, t. 3252) and produced an umbel with eighteen flowers. It is found in the Caucasus and Armenia" (*The Primulas of Europe*, by John McWatt, M.B., etc.), see also *R.H.S. Journal*, vol. XXXIX, p. 171, and Engler's *Pflanzenreich*, vol. XXII, pp. 48 and 56.

Professor Bayley Balfour gives *P. Sibthorpii* or *P. acaulis* var. *rubra* as a parent of all our forms of pink, red, purple and blue Primroses (*R.H.S. Journal*, vol. XXXIX, p. 171).

"*P. Sibthorpii* is found in Greece and northern Persia, and is a parent of all our coloured Primroses. The colours of the flowers range from purple to rose and reddish-pink. It flowers in February." (Dr. McWatt in *Primulas of Europe*.)

Coloured Primroses were recorded so early as 1629 (Parkinson), and yet through all the following years no mention is made of blue until a comparatively recent date. Was not the introduction of a new plant necessary, and where more likely to be found than in the gardens of keen horticulturists who raised the first blue Primroses?

A cottager's garden in Surrey has been under observation for several years. In it, yellow, pink, red and lilac Primroses seed freely among the bushes, but no blue ever appears. On the other hand, when blues are once cultivated near other Primroses or Polyanthus, sooner or later, blue natural seedlings will appear amongst these. This year there appeared here among my seedlings a good blue Jack-in-the-Green.

Were the original parents of the blue Primrose the old blue Polyanthus (*P. amoena*) and *P. Sibthorpii*? One or both parents must have been of early flowering habit, as blue Primroses are very early, often flowering all the winter.

A cross was made here between the Spetchley Polyanthus strain and a blue Primrose and it advanced the flowering time by several weeks. *Annabelle Hosking, Merton Park.*

## THE VILMORIN ESTABLISHMENTS.

THE firm of Vilmorin-Andrieux et Cie has six establishments.

The Central Offices, at Quai de la Mégisserie, in Paris, have occupied the same site ever since the business was created. The old building was taken down and rebuilt in 1855. In that connection a picturesque tale is told: It is said that the new building had just been erected when Baron Haussmann, Napoleon III's minister, first brought into operation his plan for the improvement of Paris. It happened that the new structure stood just on the required front, according to the Baron's plan, but did not possess the regulation height and style which had been uniformly set for all the houses on the embankment; the building therefore would have been condemned had not some person of rank pleaded with the sovereign that M. Vilmorin be allowed to keep his store as it was; the Emperor answered: "It is not a store, it is a scientific institute, let it stand." This little story goes to show the fame the Vilmorin's activities had earned already. The building of 1855 is now only about a third of the block of office premises as now standing. Over 300 members of the staff and a private printing shop attend to the office work connected with the business and its management, but except for a small amount of cash sales over the counter, the actual

handling of seeds is done in the warehouse, at 115 rue de Reuilly.

The Reuilly Warehouse, which provides over ten acres of space under one roof, is operated by a staff of over 500 people; it has its own power plant, with every mechanical contrivance for the drying, cleaning handling and packing of seeds, an automatic laundry and bag-cleaning machine, box factory, tool shop, etc., a fully-equipped seed-testing laboratory and trial grounds where are made the first tests of all seeds handled by the firm.

Verrières-Le-Buisson, about ten miles from Paris, on the south-western side, is the oldest of the Vilmorin's out-of-town establishments. It has been the family seat ever since M. Philippe Andre de Vilmorin bought it in 1815. The botanical collection which he then started has been since enlarged to include over 10,000 different types or species of plants; some trees in the grounds are unique specimens, dating back from the days of their first introduction to Europe.

This establishment is at present the largest plant-breeding station in the world. Over 50,000 different plots are cultivated every year and the records kept. Three laboratories, one of chemistry, one of botany, and one of plant diseases, insure scientific investigation.

A visitor to Verrières should see the library of over 7,000 volumes, the museum, and the rockery for alpine plants which the late Mr. Philippe de Vilmorin built on the lines of the Rock Garden at Kew, and which, although much smaller than the latter, is the largest to be seen in the neighbourhood of Paris.

Not far from Verrières, close to the railway, a large warehouse was built in 1890 at Massy-Palaiseau, to supplement the one at Reuilly. On the 200 acres of land around it, the same kind of plant-breeding work as at Verrières is carried on, while similar work is carried on on a large scale for agricultural seeds at the farm called Les Granges, picturesquely situated on a hill, in the vicinity.

Empel, is the name of another of the Vilmorin's places, on the Riviera, at Antibes, started long ago by M. Henry L. de Vilmorin, for the cultivation of plants that grow and seed best in a mild and sunny climate such as Chinese Primulas, Cyclamens, Asparagus, flowering Cannas, etc. There about fifty men are engaged in work that is carried on out on same scientific principles as at the other establishments.

Le Puy, another small establishment, is operated by the firm in the forest region of Haute Loire for the purpose of collecting and drying seeds of certain forest trees, chiefly of the Scotch Fir (*Pinus sylvestris*).

Before bringing to a close this brief account of the Vilmorin establishments, a few figures may be given to describe the growth of the business: In the year 1846, 2,410 letters were received; 350,000 in 1907, and 600,000 in 1925. The entire staff consisted of 42 men in 1855, and about 600 in 1907; it is now 1,650, and is increasing every year. A. M.

## NOTICE OF BOOKS.

### Citrus Fruits.

UNDER the general term "Citrus Fruits," are included not only Oranges and Lemons, which are known to everyone, but also the less familiar Grape Fruit or Pomelo, the Shaddocks, Kumquats and Limes. Of each of these fruits there are a number of varieties, as will be recalled by those readers who had the opportunity of seeing the fine collection which Commandatore Hanbury sent from the gardens at La Mortola to the meeting of the Royal Horticultural Society on January 25, 1927.

Originally from Cochin China and countries adjacent, the different species of Citrus are now widely cultivated, and have become the subject of important industries in many countries. Formerly, commercial supplies of Oranges and Lemons were derived chiefly from Mediterranean countries, Spain, Italy and Jaffa being important producers, but with the growth of population and the development of agriculture

## SANDERS' ORCHID GUIDE

1927 EDITION.

450 pages. Handsomely bound.

Invaluable to all interested in Orchids. All the best known species described. Full cultural directions. Post free - £1 : 11 : 6

## KELWAY'S DELPHINIUMS

THE TOUCH OF SPRING is upon the garden—Now is the time to plant KELWAY'S LOVELY BLUE DELPHINIUMS for splendid development early in 1927. To obtain the best effect Kelway's Delphiniums should be planted massed or grouped in large gardens, in borders, on their own, or in groups in a general border. In smaller gardens, in beds by themselves or introduced here and there. They are easily cultivated and produce a profusion of stately, conspicuous flower spikes from the end of June until late in autumn.

They are at prices to suit every purse, for example :  
Collection 'B,' good varieties to name, 21/- per doz., 150/- 100  
Collection 'D,' a wonderful selection, 40/- per doz., 300/- 100  
Collection 'F,' the cream of the varieties - 70/- per doz.

Carefully packed and sent free when remittance is enclosed with order for £3 and over; or a descriptive priced catalogue will be sent on demand.

Every Genuine Tin, Bag and Seal bears the Trade Mark.

in new countries, and the consequent increase in the demand for these fruits, their cultivation has been extended to new geographical areas. The more important of the new countries concerned are Australia and South Africa, where large areas are now under Citrus fruits, and the southern United States, especially California and Florida, where the Citrus fruit industry has become of great importance.

An account of the cultivation of Citrus fruits in the United States forms the subject of an important book\* that has recently issued from the press. The author, Mr. Harold Hume, claims to have had, for more than a quarter-of-a-century, contact with every phase of Citrus culture, and he has embodied his experience in this book, which is certainly the most comprehensive work on the subject. In the United States, Citrus culture has now become a highly specialised industry, and holdings of hundreds or thousands of acres under this crop are common. Every phase of the industry has been standardised in recent years, and the descriptions of the methods practised should prove interesting and profitable reading to the commercial fruit-grower in this country.

Speaking of the practice in vogue twenty years ago, the author says: "Gone are the numerous varieties that made up the planting lists of that period; in their stead a brief list of fruits remain, sufficient to cover the harvest season. Gone are the individually-operated and crudely-equipped packing houses. They have been replaced by community packing-plants in which fruits are handled in large quantities. This has made for greater uniformity in the product marketed and better returns to the grower. Gone are most of the old-time sprays—wonderful compounds that often did more harm to the trees than to insect life. They have been replaced by more efficient mixtures."

In the opening chapters is an account of the botany of Citrus fruits, which should prove of general interest, each species and variety being described in detail, and figured. The classification adopted is that of W. T. Swingle of the U.S. Department of Agriculture at Washington. Under this scheme of classification the genus Citrus is separated into three genera, Poncirus, Fortunella and Citrus. The genus Poncirus has been re-established as the name of the trifoliate Orange, commonly known as Citrus trifoliata, which is largely employed as a stock for Oranges, as it imparts to the trees hardness and resistance to heat and cold. The genus Fortunella has been established for the Kumquats, which were first introduced to Europe by Robert Fortune, the botanical explorer, in 1846. The remaining Citrus fruits of commerce are included in the genus Citrus, but several changes in the nomenclature of the species have been made. Following these descriptions are chapters dealing with the breeding of new varieties, and with every detail connected with the propagation, planting, cultivation and maintenance of Citrus groves. Amongst these operations irrigation and the fertilisation of the soil are important, the former being the more important in California, whilst the latter constitutes one of the first questions in Florida. The author is to the point in dealing with soil fertilisation; he states (p. 288), "the grower who neglects his trees should undertake some other line of work," and on p. 289, "Chemical analyses of Citrus soils are frequently regarded by growers as giving a definite indication of the fertilisers to be used. As a matter of fact, while such analyses have some value when applied to certain soils, they should not be regarded as an absolute guide. The chemist cannot give dependable information covering the availability of the plant foods in the soil, or the forms in which they occur." On the selection of suitable fertilisers depends the quality of the fruit; "it may be thin-skinned, heavy and juicy through the use of proper materials, or on the other hand, it may be thick-skinned, full of rag, insipid and lacking in character, owing to the use of poorly balanced fertilisers."

Protection from frosts is another problem that calls for a good deal of care and attention.

The term frosts in the United States corresponds to our "white" frosts, whilst freezes appear to be the equivalent of our "black" frosts. Whilst acid fruits, such as Limes and Grape Fruits, come to perfection in frostless areas, Oranges are said to reach their highest quality in countries where frosts occur, consequently there is always a risk of injury to the trees from this cause, and stoves and open fires of wood are employed in the groves to minimise the damage.

It is in the preparation of the fruit for market that great developments have been made during recent years, and every phase in the handling and packing of the fruit is carefully regulated. Machinery is largely employed in the packing houses for grading, washing and drying the fruits before they are packed into standardised cases. In view of the campaign against the marketing of green fruits, artificial colouring is now carried out. This is effected by exposing the fruits in special houses to the action of the gas given off by kerosene stoves or the exhaust gases from gasoline engines. "Good fruit," states the author, "stimulates demand. If the quality is good and the appearance fine, more can be sold than if it is of inferior stock."

The marketing is chiefly in the hands of co-operative marketing organisations, of which the most important are the California Fruit Growers' Exchange and the Florida Citrus Exchange. These organisations not only distribute the fruit, but collect information on markets, advertise and secure a wide distribution and a large consumption.

The book concludes with a description of insect and fungous pests of Citrus fruits, and gives methods of control and formulae of insecticides and fungicides.

It will be seen that the subject is exhaustively treated, and a word must be said for the illustrations, which are not only numerous, but carefully selected. "A single picture," writes the author, "may tell more than a page, or indeed, several pages, of print." The book, although written from the American standpoint, can be recommended to all interested in the cultivation of Citrus fruits, for it gives sound advice in plain language on all matters concerning the cultivation and marketing of this important group of commercial fruits.

## LILIES AT OTTAWA IN 1926.

DURING the summer of 1926 the seedling Lilies made a fine show in the garden at the Experimental Farm. *L. regale* is the most popular, and it grows so well that it is an ideal plant for the hardy border. Seedlings of *L. Willmottiae* (open fertilized) and of *L. Davidii* × *L. Willmottiae* attracted much attention by their gorgeous colour and floriferousness. Some plants had over forty blooms. For general garden effect there seemed to be very little difference between the *Willmottiae* seedlings and the hybrids.

In 1925 one seedling amongst those of *L. Willmottiae* was labelled as distinct, and this bulb and its bulblets were marked when the bulbs were transplanted from the frame into the garden. It was a pleasant surprise to find that this special plant was something quite different to its known parent, and, indeed, to any other Lily of which the writer has any knowledge. It bloomed a little earlier than the other seedlings. It differs from *Willmottiae* in the shape of the flowers, which are open and upright instead of being reflexed and nodding. The plants were about three feet tall instead of five-and-a-half feet, which is the average of the other seedlings. The colour of the flowers is not quite so vivid as in *L. Willmottiae*, and no seed-pods were formed. The leaves are long, narrow and dark green, clustered on the stem as in *L. Willmottiae*. The flowering season is later than that of most upright flowering Lilies; the narrow leaves are also unusual. It seems to be hardy and a good propagator, so that it may prove to be worthy of a place in the gardens of the future.

The *L. tigrinum* seedlings reported in *The Gardeners' Chronicle* of February 20, 1925, bloomed well in 1926. *L. tigrinum* × *L. Willmottiae* was very like the female parent,

except that there was no down on any part of it. The stem grew to five feet, and was glossy green with a brown tinge. The lower leaves were long and narrow, while the upper ones were shorter and broader. The pedicels were three inches long and about an inch apart on the stem. There were about twenty blooms, which were not quite so large as those of the largest type of *L. tigrinum*. In shape they were much the same, but the colour—flame-scarlet in *Ridgeway's Colour Chart*—was more vivid, and the spots were very dark.

Of the *L. tigrinum* × *L. Maximowiczii* cross, there were several seedlings and three distinct types, although the seeds all came out of one seed-pod. The first and most attractive grew six feet tall and was thickly covered with down in all parts. The lower leaves were long and narrow, while the upper ones were broader. It was the length of the pedicels, six inches, which made this plant so noticeable. Many of them were branched and there were more than twenty-five blooms. These were smaller than in *L. tigrinum*, flame-scarlet (*Ridgeway*) in colour with small dark spots. The petals were strongly reflexed and all faced downwards. Five weeks elapsed between the opening of the first flower and the fading of the last one.

The second type, in 1925, was described as growing two feet high, with pale, unhealthy-looking flowers. In 1926 the plant grew and showed flower buds, but developed disease and died completely. Although this plant was growing between the two, neither of these showed disease.

The third type grew to be two-and-one-half feet tall, and showed very little down. The leaves were much the same as in the first, except that they were smaller. The flowers were clustered at the top of the stem, the pedicels were short so that the blooms had no room to expand. The colour was not quite so vivid as in the others; *grenadine* (*Ridgeway*) seemed to be the nearest to it, but anyone who has tried, knows how difficult it is to describe the colour of a flower.

The *L. testaceum* seedlings were transplanted in the autumn of 1925, and did not bloom in 1926. *L. testaceum* does not thrive in the garden at Ottawa, so it is not surprising that its seedlings sulk also.

The seedlings of *L. Hansonii* crossed with *Martagon* hybrids are growing very slowly, but, again, our conditions do not suit *Martagons*, so, whether we shall be able to grow these hybrids to blooming size seems doubtful. *L. Sargentiae* was transplanted in the open in light, sandy soil in the autumn of 1925. The position seemed to suit it and it grew into a strong plant and flowered well and set seed. *L. sulphureum* and *L. sulphurgale* were treated the same way, but they did not flower although they grew. *Isabella Preston*, Central Experimental Farm, Ottawa, Canada.

## LILIES ON THE COTSWOLDS.

THE Cotswold district is invariably subjected to a long winter; severe frosts are not uncommon, fog is prevalent, the atmosphere humid, late spring frosts and cold east and north-east winds frequent, hence it will be readily understood that the conditions are not favourable to the growth of many kinds of Lilies. The soil, in the Cirencester district, is calcareous loam over clay, so that sites must be prepared for the reception of several species.

It is ever interesting and profitable to review one's successes and one's failures, and possibly the latter possess the greater educational value; a retrospect extending to twenty years tells of some successes with Lilies and a number of failures, and if this experience has served no other purpose, it has shown what species are suited to a cold and damp district and tabooed a whole list of interesting and beautiful plants.

*L. umbellatum* and its varieties have occupied for many years permanent positions in the hardy flower borders, and have fully maintained their vigour; the bulbs have been periodically lifted and replanted, and with the general collection of perennial border plants, have received annual surface dressings of rotted manure or of leaf-mould. These remarks apply

\* *The Cultivation of Citrus Fruits*, by Harold Hume, pp. xxi + 561, illus. London: Macmillan and Co., Ltd. 1926. Price 21/- net.

also to *L. pyrenaicum*, *L. Martagon*, *L. chalcidonicum* and *L. croceum*, all of which have grown with the utmost vigour and have displayed satisfying floriferousness. I made reference in this journal, some few weeks ago, to the remarkable growth displayed by *L. Martagon dalmaticum*; some bulbs had been growing for several seasons in one position and had been making good average growth, but, following lifting and replanting, produced stems for the two following seasons from six feet to eight feet high, and one isolated specimen attained to even greater height. Subsequently these plants resumed an annual normal growth of three feet to five feet, but whether frequent removals would have caused a recurrence of luxuriant proportions is an open question.

*L. M. album* was quite satisfactory for a time, but proved a comparatively short-lived plant. *L. Henryi*, planted in a border at the base of a west wall, in company with *Paeonies*, made, for a season or two, extraordinary growth, but subsequently dwindled to quite ordinary proportions; in other positions this species did quite well, and may be regarded as a satisfactory Lily for the soil of this district. *L. candidum* (the Madonna Lily) is a feature of Gloucestershire cottage gardens and in many old-world villages are to be found masses of extraordinary duration; newly-planted bulbs are subject to disease, and where this lovely plant will establish itself, it should remain to work out its own salvation.

*L. Hansonii* is extremely satisfactory, flowering with the utmost regularity and efficiency in the hardy flower border; the addition of peat is often advised for this Lily, but I do not find it necessary. With this species, as with many others, it is wise to plant it where other growth will shelter it from late frosts and keen winds, which undoubtedly cause unsatisfactory growth of these Lilies.

*L. tigrinum* in variety thrives excellently and is certainly one of the most useful members of the genus.

*L. pardalinum* is quite good in the existing soil, in sun or half-shade, but is even better in a bed of peat or woodland mould; it is both persistent and floriferous. *L. testaceum* (syn. *excelsum*), the Nankeen Lily, has proved a fine border plant over a number of years and, like *L. candidum*, resents disturbance. *L. monadelphum Szovitzianum* grew and flowered very satisfactorily for a number of years, planted in a deep and stiff loam; it evidently enjoyed full exposure to the sun. *L. elegans*, *L. dauricum* and *L. pomponium* are all good border plants, succeeding under normally good conditions, and with a minimum of attention. *D. rubellum* was for two or three seasons quite satisfactory, but the plants subsequently weakened, and eventually disappeared; *L. Brownii* behaved in similar manner and was never a success. *L. auratum*, *L. speciosum* and *L. longiflorum* do not succeed for very long; the two former species I have known to do quite well for one, possibly two seasons, and then to weaken rapidly. *L. auratum* does not succeed, although at Westonbirt, twelve miles distant, where there is a natural vein of peat, I believe there existed and perhaps still exist some grand specimens of this magnificent Lily.

*L. sulphureum* is undeniably a greenhouse Lily, as are most Indian species, but I have known it to grow and flower remarkably well in a sheltered garden for two or three seasons; it should certainly be tried in favoured localities.

Of the newer Lilies, *L. regale* and *L. centifolium* are, perhaps, pre-eminent; the former has already proved itself to be a magnificent garden plant, and the latter, a plant of noble proportions, bids fair to do so also; these two species are not in the least fastidious and thrive in a variety of soils and situations. The long, damp winters are possibly injurious to the resting bulbs of several species, and the late frosts and cold winds take their toll; possibly the finest Lily gardens are in the Heath and Pine districts, but Lilies are capricious, thriving in most unlikely circumstances and *vice versa*.

*L. tenuifolium* is fairly happy in stiff loam and full exposure, and *L. giganteum* will always thrive in thin woodland in a soil rich in humus. Other species have received a trial, but the Cotswold country is not, I am afraid, a good Lily country, as I think the late Mr. H. J. Elwes discovered at Colesborne. *Ralph E. Arnold.*

## ROOT ROT OF RICHARDIA.

(RICHARDIA = CALLA AND ARUM).

### A NEW FUNGOUS DISEASE.

DURING February of this year, we received, through the medium of *The Gardeners' Chronicle*, specimens of *Richardias* (*Callas*) which proved on examination to be affected with a fungous disease new to this country. Microscopic examination of the plants showed the presence of a fungus with the characteristics just described and figured by Dr. C. J. Buisman in the February issue of the Dutch journal, *Tijdschrift over Plantenziekten*.\* In this article the disease symptoms are described, and a preliminary account is given of the fungus, of which full details are promised later. It will be of interest

FIG. 116.—ROOT ROT OF RICHARDIA.

Two young plants with the majority of their roots rotted and brown. Even the few white and turgid roots shown are infected near their tips; 2/5 natural size.

to give here the particulars of the disease, as they have been observed in Holland, especially as successful measures of control are stated to have been obtained. For several years past a root rot of *Richardias* had been observed in that country, the disease being frequently associated with the production of few and small flowers. This disease was noticed in several nurseries, where the rhizomes had been obtained from the same grower, in whose houses the stock was apparently heavily infected.

The general course of the disease is as follows:—On the resumption of the growth of the plant after the resting period, the outermost of the new leaves which have been formed shows a yellow discoloration which gradually develops further, until the leaf-stalk becomes flaccid and the leaf falls over and withers. After a little time, the second leaf is affected similarly. In these

circumstances further growth does not take place, but the plant does not die. New leaves are formed successively, which turn yellow and dry up; the plant remains small and produces only miserable flowers. It was found that diseased plants came out easily from the pot, the roots having for the greater part rotted away. The corm also is affected to some extent, and may even be partly rotted. The diseased roots, some of which were left behind in the soil, had a smooth, glassy appearance, and frequently showed a reddish discoloration. On a microscopic examination of the diseased roots, the first thing that struck the eye were great numbers of eelworms; these, however, were not apparently a parasitic species, and so could not be considered the cause of the disease. All kinds of "moulds," such as *Thielavia basicola* and different *Phycomycetes*, were also present. If an affected plant is taken and all its roots removed, and it is then planted up in fresh soil, the disease reappears after some time. It seems clear that the disease is brought in the corm, and later reaches the roots via the leaf mould. In one experiment, two lots of young corms of diseased plants were taken and, after the removal of their roots, were placed in a nutrient solution. One lot was dipped into diluted formalin (one part of commercial solution to twenty parts of water) and well brushed; in the case of the other lot, water only was used. The formalin-treated plants produced, after a time, healthy, thick roots, while the roots of the control plants developed the disease.

On rotted roots the fungus produced an abundance of sporangia in which zoospores were formed in the manner characteristic of *Phytophthora*. (The fungus is well illustrated in a drawing showing the sporangia produced on a root in water culture.)

The fungus was isolated and observed in pure culture and found to be of the type of *Blepharospira cambivora*, which Petri has recently stated to be the cause of the *Phytophthora*-like disease of the Sweet Chestnut—the so-called Ink Disease of Chestnuts. It was considered to be a species new to science, and is named *Phytophthora Richardiae*. Inoculations, using pure cultures of the mycelium in agar, were made on healthy roots, which after some time became glassy and flaccid, and eventually rotten and slimy. In another experiment, large, healthy plants of *Richardia* were taken and their roots removed. Some were then inoculated with mycelium of the fungus grown in an Oat nutrient solution, while to the remaining plants only the Oat nutrient solution was applied. In about eight weeks the control plants had grown very considerably, while those inoculated with mycelium had made no growth, had produced few roots, and on these there was the typical appearance of the rot.

It is pointed out that Dr. Bewley had stated that the corms of *Richardia* will withstand immersion for four hours in diluted formalin (one part of commercial formalin to forty-nine parts of water). The following recommendation for the control of the root rot of *Richardia* is given: Clean the corms by washing in water, then immerse them in formalin diluted one to forty-nine, for one hour. It is suggested, as being advisable, that all the rotted portions of the corm should be cut out. Infected soil, in which diseased plants have been grown, must not be used again, and if the same pots are used, they should first be sterilised.

The specimens of *Richardia* we received came from Berkshire, and were reported by the grower to be making very poor growth. On examination of the plants it was seen that one of the two leaves showed a tendency to yellow coloration, and that although the rhizome ("corm") was firm and apparently healthy, there was a paucity of roots.

The plants were young and the largest measured twenty-two inches from the tip of the leaf to the end of the roots. A few of the latter, where healthy, had attained a length of nine inches. When all the adhering soil had been carefully washed away, the most noticeable feature indicating a diseased condition was the presence of the remains of numerous roots so completely rotted that only the epidermis existed in the form of a flat, collapsed tube, brown in colour and, owing to the wet conditions,

\* Buisman, C. J. Een wortelziekte van Calla, veroorzaakt door een *Phytophthora*-soort. *Tijdschr. over Plantenziekten*. XXXIII. 17-22, 1927.

fleecy and closely applied to the side of the corm. It appeared that the rotting had taken place suddenly, and in some cases at an advanced stage of development of the roots, because here and there the collapsed epidermis was still provided with several lateral roots which were also in a similar state of collapse. On one or two of the rhizomes, all the roots were reduced to this condition, and since they adhered so closely to the rhizome, it might well have been thought, on casual inspection, that no roots had ever grown out. On the majority, however, from one to a dozen white and apparently healthy roots occurred in company with many more in a brown, collapsed condition on the same rhizome. (See Figs. 116 and 117.)

Close inspection of these white roots or their laterals showed that instead of being pure white and opaque as in the healthy condition, they were rather greyish-white and translucent in places, most commonly near the root tips, and here and there the translucent patches were extended and were assuming a brown coloration. Normal, healthy, white roots are turgid and strong and well able to support their own weight; it was noticed, however, that where the translucent water-soaked areas occurred, the roots showed a tendency to weakness. Even a short length of such a root could not be held at one end in the horizontal position without its free end bending downwards.

Seven corms which we were able through the courtesy of our correspondent to examine, showed no internal rot, and all were affected with the root disease described.

The following method of investigation was adopted in the present case in order to determine whether the disease might perhaps be the same as that already reported from Holland. Longitudinal sections of the root having shown the presence of long, unseptate and very broad hyphae, certain roots and their laterals, white and apparently healthy for the greater part of their length, but having slightly translucent areas, were cut from the corms and were laid in flat glass dishes with sufficient water nearly to cover them. The plants also were kept in the laboratory with their roots in water.

After twenty-four hours the roots were examined with the microscope, without removing them from the dishes, and it was discovered that a thick growth of sporangiophores and sporangia of a fungus, closely agreeing with that described from Holland, was present on several of the roots—particularly near the tips of several of the laterals. The sporangiophores growing from the root into the water, were mostly unbranched and bore a single terminal sporangium. Some were so short that the sporangium barely projected from the root outline, but the majority massed themselves into a fringe covering a distance of 0.5 to 0.7 mm. from the root. The longest unbranched sporangiophore measured 0.96 mm.; they were 3.4 $\mu$  thick (diam.), and there was a septum at the base of the mature sporangium. The latter commonly measured 52 $\mu$  by 33 $\mu$ ; they were somewhat variable in shape, mostly oval and often with the upper third narrower than the lower two thirds. The tip was rounded and not apiculate. The contents of the sporangium were densely granular and of grey-green colour; segmentation later became visible and at maturity the apex of the sporangium opened and a number of zoospores, usually eight, escaped singly through the opening. The zoospores, when escaping from the sporangium, measured 16-18 $\mu$  by 10-12 $\mu$  (oval) or 14-16 $\mu$  diam. (globular). Outside the sporangium there was a pause of several seconds before the zoospores moved away in the water.

This process takes place without the sporangium being shed, and a few hours after the release of zoospores, the tip of the sporangiophore (i.e., at the position occupied by the septum) begins to grow out into the cavity of the now empty sporangium. The sporangiophore is sometimes swollen (6 $\mu$ ) below the empty sporangium, and the new growth is thinner, starting at 3 $\mu$  and soon widening to 4 $\mu$ ; in some cases, however, the reverse condition is seen and the new growth immediately inside the empty sporangium is thicker than the original. Commonly the new growth swells out to form a fresh sporangium while it is still within the cavity of the one first formed, and in this position the new sporangium, with only its apex protruding

from the original cavity, releases its zoospores. This proceeding may be repeated two or three times, and the succession of empty walls is seen persisting on the sporangiophore at short intervals (Fig. 118). Here and there the intervals are seen to be longer and the empty sporangia are well separated from each other. On rare occasions, perhaps only as a result of the plentiful supply of water, the outgrowing sporangiophore continues so far as 180 $\mu$  beyond the original empty wall. It then forms a globular swelling (about 10 $\mu$  diameter) from which two laterals arise, in addition to a continuation of growth of the main hypha. Each of the three then produces a terminal sporangium. Branching may occur without any such swelling of the main hypha.

It frequently happens that zoospores are unable to escape from the opening of the spor-

after this has grown to a considerable length, one or two additional germ tubes grow out from the same zoospore (see Fig. 119).

Very numerous smooth, thick walled, round oospores were observed in recently attacked roots. These measured 14-20 $\mu$  (mode 18 $\mu$ ), but whether these are connected with the *Phytophthora* described can only be determined by further investigation.

FIG. 118.—ROOT ROT OF RICHARDIA.

Successive formation of sporangia of the fungus. A sporangium (left) has recently discharged its zoospores and the sporangiophore is beginning to grow into the cavity. On right, the process is nearly completed for the second time.  $\times 217$ .

The manner in which the disease has been introduced (unless the fungus is a native) must in this case remain unknown since the grower states that, as far as can be traced, the present stock of Callas has not been supplemented from outside sources for twenty years. It is already known that other species of *Phytophthora* may be introduced into premises formerly free from disease, by means of surface drainage water or even by the use of a contaminated water supply.\*

As regards the measures of control to be adopted, we can at present only advise the use on an experimental scale, of the formalin solution found effective by Dr. C. J. Buisman, and we would specially emphasise the necessity for not using infected earth or pots for corms which have been thus sterilised. The value of "Cheshunt Compound" for keeping in check the ravages of *Phytophthora cryptogea*, which spreads in the soil, suggests that this might prove to be a valuable additional means of controlling the spread of the present fungus.

When visiting a nursery near Folkestone, on March 22, a further case of the above-described disease was met with. The foreman had noticed a number of his *Richardias* or *Arum* plants (which had been raised from seed) showing a yellowing of

FIG. 117.—ROOT ROT OF RICHARDIA.

Part of plant (left side of Fig. 116) showing the collapsed, dark brown roots in an advanced state of decay. Natural size.

FIG. 119.—ROOT ROT OF RICHARDIA.

Left, zoospores after escaping from a sporangium and swimming in water, have come to rest and are germinating with one to three germ tubes. Right, zoospores which have failed to escape and from which germ tubes are growing through the wall of the sporangium.  $\times 217$ .

the foliage accompanied by a root-rot. We kept specimens of these in water for one day in the laboratory and then found, on examination of diseased roots, sporangia of the *Phytophthora*.

Having now found that a root rot of *Richardias* with which *Phytophthora Richardiae* is associated, is present in this country, we await with interest the publication of Dr. Buisman's full account of the fungus. *E. S. Salmon and W. M. Ware, South-Eastern Agricultural College, Wye, Kent.*

## PUBLIC PARKS AND GARDENS.

A **SCHEME** is under consideration for the provision of new recreation grounds at Whitecraigs, near Glasgow.

**THE** Ministry of Health has held an enquiry at Lewisham Town Hall regarding a proposal by the L.C.C. to take 225 acres of the 500 undeveloped acres of the St. Germans estate, for use as open spaces.

**MR. COSTAIN**, of Messrs. R. Costain and Sons, Ltd., has presented the Willeaden Urban District Council with land on the north side of the North Circular Road, for a recreation ground.

**GUISELEY** Urban District Council proposes to provide pleasure grounds in Otley Road, at an estimated cost of £1,200.

**THE** Urban District Council of Clevedon has decided to purchase Wain's Hill with a view to preserving it as an open space.

**WIMBLEDON** Town Council has agreed to negotiate for the purchase of about eighteen-and-a-half acres of land off Woodhayes Road, for an open space.

**CUDHAM** Parish Council is asking Bromley, Kent, Rural District Council to acquire land for a recreation ground at Cudham East.

**GOLCAR** Urban District Council has accepted Lord Savile's gift of the Crow Lane Recreation Ground, and the conditions attached thereto, provided a period of five years is allowed to carry out the work required.

**BRIDGWATER** Town Council has approved proposals prepared by the Borough Surveyor for improving the various parks as follow:—Victoria Park, £4,500; Eastover Park, £2,371; and Cannon open space, £144.

**SIR WILLIAM BERRY**, of Barrow Hills, Long Cross, has offered to give about 23½ acres of the St. Ann's Hill estate, Chertsey, to the Chertsey Urban Council as a gift to the district. The estate is one of the prettiest in Surrey, and commands a view of four or five counties. Charles James Fox, the statesman, lived at St. Ann's Hill House.

**THE** Yiewsley Urban District Council has been informed of the intention of the Middlesex County Council to contribute £307 towards the cost of acquiring Clark's Meadow for a recreation ground.

**LLANTABNAM** Urban District Council proposes to make application for sanction to borrow £590 for the purchase of land for a recreation ground.

**BOGNOR** Urban District Council is seeking the sanction of the Ministry of Health to purchase land for pleasure grounds and a motor park. The price is £5,000.

**THE** Giffnock Ratepayers' Committee recommends the Eastwood Landward Committee to purchase five or six acres of land for recreation purposes.

## FRUIT GARDEN.

### BIENNIAL CROPPING OF APPLES.

**MR. GRIGOR ROY** (p. 200) naturally assumes that my grass orchards are grazed by stock. I have so often described the sod-mulch system which I follow that I omitted to mention it on this occasion. I agree entirely that, if the grass is kept close grazed by stock, provided that the animals are given plenty of concentrated food, the trees receive all the nitrogen they require;

and the only further manuring needed is an occasional dressing of some phosphatic fertiliser.

In my conditions, however, I find that the sod-mulch system gives good results, and I am not using stock so far. The grass is mown twice a year, and spread over the surface as a mulch, which soon disappears into the soil. I manure the grass with cheap mineral fertilisers. These are, no doubt, used largely (not entirely) by the grass at first; but the plant food goes back into the soil in organic form when the grass is mown. I like this system because it greatly enriches the soil in humus, which is badly needed. Also the trees are less likely, I think, to suffer from drought than where the land is grazed. The nitrate of soda does, of course, give a rank growth of grass; but this I like, because it means a thick mulch when the grass is mown. I take care to keep my orchards supplied with phosphatic and potassic manures as well as nitrogenous fertilisers, as I thoroughly believe in balanced feeding.

I am applying nitrate of soda now, as I want more growth. Phosphates and potash will probably follow in the autumn.

Past experience has shown me that I can get growth even in rather old, stunted trees, in grass, by the use of nitrate of soda. In some cases such trees have taken on quite a new lease of life. *Market Grower.*

## ORANGES IN POTS.

**ORANGES** are easily grown, and the yield of some Orange trees in pots is simply astounding; many years ago few gardens of note were without a collection of these trees for decorative as well as edible purposes.

At this season, after the crop is cleared, the trees should be kept rather cool, and advantage taken of this period of rest to repot any trees that require it, but this is not needed oftener than once in two or three years. A surface dressing of good fibrous loam, bone-meal, and a little charcoal is generally sufficient, beating it down firmly with a rammer.

When used for decorative purposes, a temperature of 50° to 55° at night and up to 70° by day with sun-heat, will be suitable, with 5° to 10° higher with sun-heat when the fruits are swelling.

Watering should be done carefully; little moisture is required at certain seasons. Scale insects must be kept in check by syringing and sponging the leaves.

Aged trees generally set too many fruits, and unless the latter are thinned freely the Oranges will be small and the trees weakened; if they are thinned freely the fruits that remain will hang on the trees longer after they are ripe, but the greater portion should always be gathered before the new blossoms open in the spring. *F. Jordan.*

## FRUIT REGISTER.

### PEAR MARÉCHAL DE LA COUR.

**NOT** infrequently called *Conseiller de la Cour*, this very fine old Pear is worthy of a position on a south or west wall.

The large fruits are highly perfumed, juicy and possess melting flesh; they are lemon-yellow, almost covered with a pale cinnamon russet, and are in season during November. During that month it has many strong competitors for favour, but it should, nevertheless, find a place for its distinct, yet rich flavour.

The tree is a vigorous grower and does best on a wall, but will succeed in bush form, and it does well also on chalky soils. In warm situations it may be grown successfully as a standard.

This fine variety was raised by Van Mons, and first fruited about 1840. *Ralph E. Arnold.*

## VEGETABLE GARDEN.

### ENDIVE.

**ENDIVE** is a valuable winter salad plant for private gardens. It grows best in a light, rich soil; a sunny position is desirable for late sowings.

It is seldom necessary to sow this crop earlier than July; a sowing made about the middle of that month, and another in the second or third week in August, are usually all that are needed.

Being a plant liable to "bolt" if it receives a check, it is advisable to sow thinly in the position where the plants are intended to grow. Scatter the seeds in rows made twelve inches to eighteen inches apart, and thin the plants in the rows to twelve inches or fifteen inches apart, according to the size of the variety. Raising plants in a seed-bed and transplanting them later may be practised under favourable conditions. Little additional attention is necessary beyond frequent hoeings, until about three months later, when the plants should be fully developed and ready for blanching. Two distinct methods of blanching can be adopted: one, generally adopted for earliest crops, is to treat the plants in the position in which they are growing; the other is to lift them and transfer them to such structures as frames, glass-houses, or a Mushroom house, in fact, any suitable building.

Dealing with the former method first, a day should be chosen when the plants are quite dry, the leaves being gathered together and tied with raffia. This system answers quite well for the earliest supplies, but covering with large flower-pots is more reliable. Various other means are used, but whatever method is adopted the chief point is to exclude light and moisture. Careful handling of the plants is necessary to prevent bruising them, for this causes premature decay.

For the latest supplies it is much safer to lift the crop when the plants are fully developed, and before the full effects of wintry conditions are felt, and store them in a frame, planting them fairly closely. Excluding rain and affording the plants protection from severe frosts are all that is necessary.

Batches may be transferred as required to a Mushroom house or some other convenient structure, or some of the plants may be blanching in the frame in which they are stored by covering them with some suitable material.

Blanching early in the autumn usually takes about ten days, and so long as three weeks as the season advances.

There are numbers of varieties to choose from, and these are divided into distinct groups, the one having entire, the other more or less deeply cut leaves. The range of colour varies from bright yellowish green to dark dull green.

Either Early Parisian Summer, or Summer Curled may be chosen for early use; Green Curled Winter, Staghorn and Broad-Leaved Batavian are all desirable varieties for late supplies.

In a trial of this vegetable at Wisley during the winter 1924-25, Fine Green Curled and White Curled withstood the winter without protection better than any other variety. *J. Wilson, Wisley.*

### SKIRRET.

(*Sium Sisarum*.)

It is seldom indeed that this vegetable is seen in gardens. Its seeds are generally listed under "Herbs," but its tender, floury, and sweet roots are used like Salsafy and Scorzonera.

Skirret is a hardy perennial, but the whole crop should be taken up every year before growth commences in spring, otherwise the roots become useless for culinary purposes.

The seeds should be sown in groups of three or four, twelve inches apart, in drills made half-an-inch deep and eighteen inches apart, in April. Thin the seedlings to one in each group when they are about three inches high. Remove the flower heads so soon as they appear, and commence lifting the roots in October. Twist off the leaves and store the roots in layers in sand or dry soil in a cellar or outhouse until required for cooking. Skirret is raised from seeds annually for producing roots for culinary purposes. *E. A. S.*

## HOME CORRESPONDENCE.

**Deep Trenching.**—I have been greatly interested in the varied letters that have recently appeared in your correspondence columns on this subject. Having had considerable experience of all kinds of soils in this country and Ireland, I consider it absolutely necessary to bring the bottom spit to the top when trenching, and the higher the quality required, whether of flowers, fruits or vegetables, the deeper the ground should be dug. Should the soil consist of very heavy clay, as it is here in Sussex, I advise working in plenty of material, such as leaf-soil, sand and mortar rubble, that will lighten the texture; this will bring the ground into a deep-rooting medium for plants. All agree that Mr. Edwin Beckett stands above all other vegetable growers, and I very much doubt if there are any other gardeners who have had such a wretched soil to deal with at the beginning as that at Aldenham. Had he left the bottom soil in position,

**Melilotus species** (see p. 104).—*Melilotus officinalis*, Lam., has the yellow petals all equal and the pod acute and hairy; *M. altissima*, Thuill., has the yellow wings and standard longer than the keel, and the pod obtuse, ribbed and smooth. The former is usually known as Common Melilot, and is supposed to be a native plant; the other is certainly an alien. Both are, however, probably aliens since both are scarcely ever found except in cultivated or ex-cultivated places, or places where foreign produce is landed. No doubt the old herbalists used them indiscriminately. *C. Nicholson*.

**Iris unguicularis.**—I was interested to read, on p. 142, Mr. Coult's directions as to the treatment of *Iris unguicularis* (syn. *stylosa*). Those of your readers who garden on the poor chalky soil which so eminently suits this and many other Irises may care to know of the treatment which I have found successful. We had at Swanley a large, old clump of this Iris, which had been in the same place, to my knowledge, for at least

to which he refers, which delight in the bright sunshine. *Jeremiah Colman, Gatton Park, Surrey.*

**Gentians.**—It was with great interest that I read Dr. Amsler's notes on Gentians, following those written by myself some little time ago. Firstly, I must correct an error into which, I am afraid, Dr. Amsler has fallen through a similarity of initials; the notes were not, as he imagines, from the pen of Mr. W. E. Th. Ingwersen, but from a far less worthy source, namely, that of his son whose earnest wish is to follow as nearly as possible in the footsteps of his father. I note that Dr. Amsler expresses disappointment at my omission of several well-known species. The notes were really intended only for random jottings of some favourites of my own, and also as a step towards getting into touch with fellow lovers of this genus. *G. scabra*, which Dr. Amsler mentions particularly, I have at present only in the seedling stage, and though I hope and believe it is true, I

FIG. 120.—MESSRS. J. CARTER AND CO'S ITALIAN GARDEN AT THE IDEAL HOME EXHIBITION, OLYMPIA.

(see p. 165).

I am sure he would not have been able to exhibit the fine collections of vegetables, groups of berried and foliage trees and shrubs as he is constantly doing at our principal exhibitions. Any who are not convinced as to the advisability of adopting Mr. Beckett's method of trenching soil will be very welcome to come and see the result in these gardens from similar treatment of the land. *F. Streeter, Petworth Park Gardens, Sussex.*

**Tree Onions.**—On page 182, Captain E. A. Saunders asks information about the Tree Onions. I have often seen them grown in Scottish gardens and sent into the kitchen when other Onions were scarce, but cooks did not care to use them—possibly because they were more pungent than the common Onion. Tree Onions may be valuable in gardens where the soil is light and it is difficult to grow the ordinary kinds, but by sowing early in boxes most gardens will produce good Onion crops. I have never seen Tree Onions grown in England, and do not know if they are more useful for pickling than the Shallot or small, silver-skinned Onion generally used. Pickled Onions were never used where the Tree Onion was grown in Aberdeenshire. *Grigor Roy, Stoke d'Abernou Manor Gardens.*

fifteen years, and was therefore very congested and starved. In September, 1925, I lifted it, divided it into pieces from four inches to six inches across, and replanted these divided portions very late in the autumn. This February there were twenty-three blooms, and the lovely little blue patch was a glorious foretaste of spring. *Lucy H. Joshua.*

**Vita Glass.**—I have been hoping that someone with longer experience than myself would reply to my friend Mr. R. Brooman-White's enquiry in your columns for the experience of your readers in growing Orchids under Vita glass. For some time I have been experimenting with Vita glass and also with various forms of artificial lighting producing ultra violet rays, thus securing those rays and extending the lighting period; but my experiments are too incomplete to give reliable results. Apparently, I may be first in exploring a field which I have long held offers many possibilities; if not, it would be very interesting to hear what experiments have been made and the results obtained. The only hint I can give Mr. Brooman-White is, that the ultra violet ray will not refract through ordinary shading; so that Orchids which are shade-loving present a different problem to the children and monkeys

cannot yet write with any certainty about it. *G. septemfida* is, of course, extremely beautiful, although I, unfortunately, do not possess the Cambridge blue form which Dr. Amsler mentions. A very unusual, and even startling, form which I saw for the first time in a friend's garden last year, had the individual flowers of the cluster almost twice the usual size, and instead of the usual, funnel-shaped flowers had wide-mouthed urns of a fine deep blue. There is at present no stock of this form, but later I hope it may be increased. From what Dr. Amsler states of his reputed plant of *G. Kurroo*, I cannot think that he had the true plant. A friend of mine has at last got the really true plant, and it promises to be quite distinct from *G. Purdomii*, but it is very hard, in fact, almost impossible, to say anything definite with regard to it at present. I have seen quite a dozen plants, all professing themselves *G. Kurroo*, and all turning out imposters, so, as I mentioned in my previous notes, I have almost given up hope of ever owning it. I am greatly pleased that my few notes have been of interest to enthusiasts, as is proved by the correspondence I have received, and by the letters published in the correspondence columns of *The Gardeners' Chronicle* subsequently. *Will Ingwersen.*

## SOCIETIES.

### BRITISH CARNATION.

MARCH 29 AND 30.—The annual Show of the above Society must be accounted the best it has ever held. There was a large number of excellent flowers set out in the various classes, and the attendance at the R.H.S. Hall, Vincent Square, was distinctly good on the first day. Considerable interest was centred in the *Daily Mail* Gold Challenge Cup which was offered for new Perpetual-flowering Carnations. There were eleven entries, and the Cup (Fig. 121) was won by Mr. A. F. DUTTON, Iver, with a superb novelty. In the judging, fragrance was given a maximum of sixty points, size fifteen points, and colour, substance, stem, form and calyx five points each. The points awarded by the judges were not published, but there could be no doubt as to the merits of the variety which won the Cup. It was named Mrs. A. J. Cobb, and is an immense bloom of rich velvety-crimson colour, distinctly fragrant, and possessing all the qualities of a first-class variety.

### OPEN CLASSES.

Messrs. C. ENGELMANN, LTD., were alone in the class for seven varieties, twenty-five blooms of each, in seven vases, but they were deservedly awarded the Monro Challenge Cup for an admirable collection of Spectrum, Master Michael Stoop, Mrs. Hamilton Fellowes, Cupid, Topsy, Katja and White Enchantress. Messrs. C. ENGELMANN also won the first prizes for three vases, twelve blooms each, of British novelties, showing excellent vases of Rouge, Nero and Circe Improved. Messrs. ALLWOOD BROS. were second with good vases of Master Michael Stoop and Shot Silk.

The first prize offered by the American Carnation Society for fifty blooms of Laddie was won by Messrs. C. ENGELMANN, LTD., who were also awarded the first prize for not fewer than one hundred excellent blooms of Vesta, and Mr. WALTER HEMUS was a good second with Dora. Messrs. ALLWOOD BROS. were first with fifty blooms in three or more varieties.

The best twenty-five blooms of a British-raised variety were of Vesta, shown by Messrs. C. ENGELMANN, LTD.; Messrs. ALLWOOD BROS. were second, with the variety Edward Allwood, and Mr. H. T. MASON third, with Magnum.

In the class for twenty-five crimson Carnations, scent was to be taken into consideration by the judges, and the first prize was won by Messrs. C. ENGELMANN, LTD., with Topsy, while Mrs. WALTER BURNS, North Myms Park, Hatfield, was second with the same variety.

There were only two exhibits of boxes of blooms to illustrate methods of packing, and Messrs. ALLWOOD BROS. were first. In the class to illustrate the best keeping varieties, the competition was very good. The boxes had been packed since the previous Saturday, and all the exhibits had kept well. The first prize was won by Messrs. C. ENGELMANN with the variety Lady Northcliffe, which, in addition to good size and great freshness, was still very fragrant. Mr. H. T. MASON, showing Topsy, Spectrum and Eros, was first, with three vases of three distinct varieties.

In the colour classes, the competition was very good, and all the flowers were of a high order of merit. White Pearl was adjudged the best variety. Laddie, shown by Messrs. C. ENGELMANN, was the best light pink, and Magnum, shown by Mr. H. T. MASON, was second. Mary Allwood staged by Messrs. ALLWOOD BROS., was the best medium pink, and Hebe, shown by Messrs. ENGELMANN, was the second best. A vivid rose variety, called Ypres, shown by Messrs. C. ENGELMANN, LTD., was first in the deep pink class, and Master Michael Stoop, shown by Messrs. ALLWOOD BROS., second.

Spectrum, shown by Mr. H. T. MASON, proved to be the best red variety, and also the Silver-Gilt Medal variety in the section. In Topsy, Messrs. C. ENGELMANN, LTD., had the best crimson, and Mr. W. H. PAGE was second with the same variety. Katja, shown by Messrs. C. ENGELMANN, LTD., was first in the class

for varieties taken from the G. and H. Lists. Maine Sunshine, shown by Messrs. C. ENGELMANN LTD., was the best yellow, and Carola Striata, by the same exhibitor, was the best Fancy. Messrs. ALLWOOD BROS. were first with a vase of twelve blooms, illustrating the first twelve colour classes, and Saffron, shown by Mr. W. H. PAGE, was the best apricot variety.

### AMATEUR CLASSES.

There were three very creditable exhibits of twelve plants of Perpetual-flowering Carnations, and S. T. HOSE, Esq. (gr. Mr. T. Humphrey), Warham Hall, Bletchworth, won the Lord Howard de Walden Challenge Vase with excellent plants of such sorts as Topsy, Red Laddie and Betty Lou. R. CHETWYND-STAPLEYTON, Esq. (gr. Mr. W. Meager), Headlands, who was second, had well-grown plants of Laddie, Brilliant and Royal Purple in his exhibit.

The class for a decorative arrangement on separate tables was very popular, both with the exhibitors and the visitors. Sir RANDOLF

FIG. 121.—"DAILY MAIL" GOLD CUP.  
Awarded to Mr. A. F. Dutton for Carnation  
Mrs. A. J. Cobb.

BAKER, Bt. (gr. Mr. A. E. Usher), Ranston, Blandford, was first with a handsome display which included especially well-grown blooms of Spectrum, Lady Baker, Laddie and Topsy. R. CHETWYND-STAPLEYTON, Esq., was second with another attractive display.

Sir RANDOLF BAKER was a very successful exhibitor, and he won the first prizes for the following: a vase of Messrs. STUART LOW AND Co.'s novelties; the best light pink variety, with Laddie; the best medium pink from List C., with Mary Allwood; and from List D., with Glorious; the best red with Spectrum; the best crimson with Topsy; the best yellow or yellow-ground Fancy with Saffron; the best purple or mauve, with Mrs. Hamilton Fellowes; and the best twenty-four blooms in not fewer than four varieties. The best white variety was White Pearl, shown by R. CHETWYND-STAPLEYTON, Esq., and LADY MOND, D.B.E. (gr. Mr. W. Petty), Melchet Court, Romsey, showing excellent blooms of Lady Hillingdon, was first in the class for Fancy Carnations.

The classes for amateurs who do not employ a full-time gardener, and for those who were unable to stage their flowers, resulted in very gratifying competition.

The class for a decorative vase of not more than twenty-five blooms was very attractive, and Mrs. WALTER BURNS was first, and Sir

RANDOLF BAKER, Bt., was second respectively with tasteful exhibits. Major H. LYNCH (gr. Mr. A. Swann), Colewood, Haywards Heath, had the best decorative bowl of Carnations.

The dinner-table decorations were very tasteful. The first prize was won by Sir RANDOLF BAKER with a delightful arrangement of Lady Margaret Boscawen, with appropriate foliage, and Mrs. A. SWANN, Colewood Lodge, Haywards Heath, was a good second in this interesting class. The first prize for a table arranged by a florist was won by Mrs. LEWIS COKER.

The class for a bouquet, sprays, buttonholes and vases of Carnations, also exhibited by florists, was an attractive feature. The first prize was awarded to Messrs. ROBERT GREEN, (1911), LTD., but we preferred the lighter and more graceful displays of Messrs. R. F. FELTON, LTD. Messrs. HARBODS, LTD., were third.

### GROUPS OF CARNATIONS.

Around the hall there were large collections of cut Carnations arranged by the principal trade growers, and these added materially to the general effect of the show.

THE BRITISH FLORISTS' FEDERATION was responsible for a magnificent display which well merited the praise it received from all. This was by far the largest exhibit in the hall, the material being supplied by various members of the Federation. As was to be expected Carnations were the most numerous, but as the object of the exhibit was to illustrate the best varieties of home-grown flowers now obtainable from florists, there were also Roses, Hydrangeas, Astilbes, pink Cinerarias, Hyacinths and Erica melanthera, all exemplifying the skill of the greatest commercial growers of the world. With this material, Mr. H. JOLIS, a well-known member of the Federation, arranged a display which was a model of what an exhibit by such an important body should be. In the centre, there was a double-tiered vase of graceful design and ample proportions filled with bright crimson blooms of Carnation Topsy, with White Wonder below. The base of the vase was filled with mauve Hyacinths, pink Astilbes, and the white Erica melanthera. Dark green Cypresses and graceful Palms, with an occasional pillar Rose, made a good background for the many vases and stands of Carnations, of which the principal sorts were Brilliant Improved, Aviator, of rich scarlet colour, Royalty, an attractive Fancy, and John Page, medium pink. The general edging was composed of Erica melanthera and Funkia Sieboldiana aurea.

In a corner space, the FLORISTS' TELEGRAPH DELIVERY ASSOCIATION had a very attractive exhibit of seasonable flowers, such as might be despatched in response to an order from any distant part. Mr. W. H. PAGE set up half-a-dozen excellent vases of Carnations. Those of Clarice Page, vivid crimson; John Page, medium pink, and Edward Page, rose pink, were, perhaps, the very best.

Considerable space under the wall was filled by Messrs. C. ENGELMANN, LTD., with a large collection of splendid cut Carnations. Not only was the exhibit extensive and comprised of many excellent varieties, but it was arranged with considerable skill and taste. Without being massive, the principal vases were generously filled with first-rate blooms of fresh and bright colours. The chief varieties were Laddie, Dorcas, Spectrum Rouge, White Enchantress and Snow White.

The display arranged by Messrs. ALLWOOD BROS. was also of great merit. By the Orchid annexe they made an attractive Carnation garden with many plants of the relatively new perpetual-border varieties and Dianthus Allwoodii. Next they had many vases of first-rate blooms, principally of the deliciously fragrant Mary Allwood, Topsy, Maine Sunshine, Spectrum, Red Laddie and Canadian Pink. In addition to their floral display, Messrs. A. ALLWOOD BROS. filled a large space with literature and various sundries of value to the Carnation grower.

Goodly vases of fine blooms were set up by Messrs. STUART LOW AND Co. in considerable quantity. Prominent positions were given to splendid vases of White Pearl, Philip Sassoon,

Ruby Glow, Mrs. Hamilton Fellowes, Daphne and Arnos Groves, though there were other sorts of value.

Messrs. KEITH LUXFORD AND Co. also set up a collection of Carnation blooms which helped to make the attractive show. Their chief varieties were Red Laddie, Aviator, White Wonder and Topsy.

An admirable collection of Narcissi was arranged by Messrs. BARR AND SONS, in which we noted several excellent seedlings, as well as many of the best named sorts. The CENTRAL GARDEN SUPPLIES had a well-arranged collection of seasonal border flowers and forced shrubs.

#### NEW VARIETIES.

There were nine new seedlings or improved varieties before the Floral Committee, who wished to see two varieties again, and granted an Award of Merit to:—

*Lady Margaret Boscawen*.—A bright pink flower of medium shade and possessing all the essentials of a first-rate decorative Carnation. The shapely, good-sized flowers are borne on long, stiff stalks, and the calyx does not split. It appears to be a very free-flowering variety, but we could detect no fragrance. Shown by Messrs. LOWE AND SHAWYER.

*Mi'ady*, which the Committee desired to see again, is an attractive, blush-pink Carnation of large size and good form, but the outer petals are often nearly white, which gives them a bleached appearance. It was shown by Mr. E. W. BISHOP, Elmhurst, Windsor.

*Souvenir*, a useful pale pink flower of good type, and possessing slight fragrance, the Committee wished to see again, also growing plants. It was shown by Mr. G. CLARKE, Leighton Buzzard.

#### MEDALS.

The Judges awarded a Large Gold Medal and special congratulations to the BRITISH FLORISTS' FEDERATION for their magnificent exhibit. Large Gold Medals were awarded to Messrs. C. ENGELMANN LTD., and Messrs. ALLWOOD BROS.; a Gold Medal to Messrs. STUART LOW AND Co.; a Silver-Gilt Medal to Messrs. KEITH LUXFORD AND Co. and a Silver Medal to Mr. W. H. PAGE for their exhibits of Carnations.

#### BIRMINGHAM AND MIDLAND COUNTIES.

At the recent meeting of the above Association, Mr. A. Jones occupied the chair, and Mr. J. Palmer, of Messrs. Simpson and Sons, gave a lecture on "The Propagation of some Herbaceous Plants." He recommended the renewed propagation and planting of herbaceous plants, for the production of good quality flowers, by one of the following methods; seeds, top-cuttings, root-cuttings, and division. March was recommended as the best time for re-planting, as the plants soon become established in spring and there is little risk of them failing.

#### READING AND DISTRICT GARDENERS'.

"How I grow Melons and Cucumbers," was the title of a paper read by Mr. F. J. Green, Aldermaston Court Gardens, before a large attendance of the members of this association, on the 7th ult. The President, Mr. Frank E. Moring, presided. In his opening remarks Mr. Green stated that the Melon had been grown in England since the sixteenth century and was introduced from Jamaica. Full cultural details were given as to the raising of early and summer crops. With regard to Cucumbers, Mr. Green said there was no certainty as to its origin, but it was introduced into England during the sixteenth century from the East Indies. Full cultural details were given and preventives suggested against diseases. His plan was to grow Cucumbers on the extension system, and he stated that from four plants he was able last season to cut over eight hundred good Cucumbers.

The competitions arranged for the evening were for Violets, and eight vases were staged. In the class for twenty-five blooms of single Violets the first prize was won by Mr. J. KRIT, Wasing Place Gardens, Newbury; the second

by Mr. A. W. GOWER, Calcot Grange Gardens. The best twenty-five blooms of double Violets were shown by Mr. J. WYNN, Luerns House Gardens, Goring; second, Mr. J. KRIT.

In the non-competitive section there were several excellent exhibits. A First Class Certificate was awarded to Mr. W. BROOMFIELD, Clyffe House Gardens, Mapledurham, for a splendid plant of Cymbidium, carrying three grand flowering spikes. Awards of Merit were granted to Mr. A. W. GOWER for several fine plants of Cinerarias, and to Mr. A. KENDALL, Clyffe View, Mapledurham, for a vase of Narcissi. Mr. F. H. PRATTEN, The Oaks, Shinfield Road, Reading, showed two vases of Violets of the varieties Mrs. Lloyd George and Tina Whitaker. Mr. F. TURNER, Southview, Calcot, staged some good sticks of Rhubarb.

THE fortnightly meeting of this Association was held on the 21st ult., when Mr. R. J. Lloyd presided.

Mr. F. Townsend, Hillside Gardens, Reading, gave a lecture on "Lawns and their Upkeep." He dealt with the selection and preparing the site for sowing and turfing lawns, the upkeep of lawns, the renovation of old lawns, and the treatment of lawns for sport. A series of lantern slides added greatly to the interest of the lecture.

#### GLASGOW AND WEST OF SCOTLAND.

MR. T. ANDERSON, M.A., B.Sc., of the Board of Agriculture for Scotland, was the lecturer at the monthly meeting of this Society on the 9th ult.

Taking for his subject "Potato Diseases," he referred at some length to wart disease. He said there was no known method of eradicating the disease in the soil, because in a thoroughly infested garden the spores were in every inch of the ground down to a depth of eighteen inches. The only way to control the trouble was by growing immune varieties, and he thought it was probable they would be able to supplant all the old, susceptible sorts with new varieties equally as good in quality and cropping and free from wart. The most likely places to which to find the disease was in private gardens and allotments, and in this connection he mentioned that the West of Scotland was the worst affected area in Scotland because of its industrial conditions and liability to a greater amount of seasonal rain than they were subjected to on the east coast. The law which prohibited the cultivation of a non-immune Potato in Scotland was no hardship, because there was a good selection of immune varieties, of which he recommended for early crop, Witch Hill and Immune Ashleaf; second-early or mid-season, Arran Comrade (which was a good substitute for British Queen), Great Scot and Abundance; late or main crop, Arran Victory, provided it was consumed before Christmas, when it began to sprout; Kerr's Pink and Golden Wonder. Arran Consul he would not actually recommend, except when a late keeping variety was wanted.

Other diseases discussed were corky scab, leaf-curl, mosaic and blight. In respect to "seed" he observed that it was the custom of people who had small gardens to save the smaller tubers for seed purposes, but he suggested that it would be more satisfactory to select the best plants, and keep the whole produce of these plants for seed. A lengthy and interesting discussion followed Mr. Anderson's remarks.

#### IPSWICH AND DISTRICT GARDENERS'.

At the monthly meeting, held on March 10, Mr. F. J. Chittenden, V.M.H., F.L.S., delivered a very interesting lecture on "The Wisley Rock Garden." There was a large attendance presided over by the President, Mr. W. Bradbury. The history of the rock garden was dealt with, its site, rocks used, and the variety of plants grown in it. A lengthy discussion followed, many interesting points being brought out by the questions of the members.

A fair display of exhibits were staged in the monthly competition.

## Obituary.

**David Crombie**.—Many horticultural friends in Ireland will be sorry to learn of the death of Mr. David Crombie, who was for many years in charge of the Marquis of Waterford's famous garden at Curraghmore, Co. Waterford, and previously gardener at Powerscourt, Co. Wicklow. Mr. Crombie's demise, which occurred on March 20, at the residence of his son, at Longhirst, Morpeth, was not unexpected, as he had suffered from recurrent heart attacks for some time. Mr. Crombie was seventy-six years of age. A full account of his career, together with his photograph, was published in *The Gardeners' Chronicle* on the occasion of his retirement from the active pursuit of his profession. Mr. David Crombie was one of the best-known gardeners in Ireland, and during a great many years he acted as a judge at the principal fruit and flower shows held in that country.

**F. Dewing**.—We regret to announce the death, on the 19th ult., at his home, 61, Portnall Road, Maida Vale, W.9., after a long illness, of Mr. F. Dewing. Until his illness, he was gardener to E. Heseltine, Esq., The Goldings, Great Warley, Essex. He was formerly gardener at Spellon Hill, Knaresborough, and for many years at Newton Hall, Stocksfield-on-Tyne. He leaves a widow to whom we extend our sympathy. The interment took place at Kensal Green Cemetery, on the 23rd ult.

**Paul Lefebvre**.—Belgian horticulture has sustained a sad and unexpected loss by the death of M. Paul Lefebvre, an Inspector at the Ministry of Agriculture, specially attached to the Horticultural Department. He was only forty-six years of age, and died as the result of an accident, having fallen down the stairs leading to a cellar, and fractured his skull. He was an indefatigable worker and exceedingly popular with all who knew him; the Director of Horticulture, M. Van Orshoven, held a high opinion of his attainments. His funeral, which took place on Wednesday, the 23rd of March, was attended by large numbers of his colleagues and friends, including a representative of the Ministry of Agriculture, and M. van Orshoven, the Director of Horticulture, in person. The cortege was led by the elder of M. Lefebvre's two young sons, besides whom he has left a widow and little daughter.

## ANSWERS TO CORRESPONDENTS.

**BLACK DOTS ON ARUM LEAVES**.—A. H. The small, black spots on your *Richardia* (Arum) plants are the fructifications (sporangia) of a fungus, *Pilobolus*, which, growing on the cow manure, have been shot up on to the foliage, etc.

**CALCEOLARIAS WITH YELLOW FOLIAGE**.—T. S. C. From the condition of the plants they appear to have been kept too cold and damp. The roots appear to be numerous and quite healthy, and with a little more warmth and sunlight the plants should grow out of their unhealthy condition; try also the effect of a little weak nitrogenous fertiliser, which might help to restore the green colour in the leaves.

**BLUE-FLOWERED HYDRANGEAS**.—T. L. It is claimed that a proprietary preparation known as Cyanol has the effect of causing the flowers of *Hydrangeas* to assume a blue tint. Others state that sulphate of iron and alum in solution, applied to the roots, has the same effect. Ammonia-alum is used by some growers for this purpose; this last is applied copiously twice a week at a strength of half-an-ounce in one gallon of water. The blue colour develops naturally in some cases and especially in plants grown near the coast, but it is always found that the tone is richer when the flowers are not exposed too much to the direct rays of the sun.

## MARKETS.

COVENT GARDEN, Tuesday, March 29th, 1927.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Tuesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market and the demand, and they may fluctuate, not only from day to day, but occasionally several times in the day.—EDS.

REMARKS.—Increased supplies have been general throughout this department during the past week; those from the Channel Islands and Cornwall have been the

largest so far received this season, and consignments were difficult to clear at the very lowest prices on Saturday last. Outdoor Daffodils are being received from home growers, and supplies are on the increase daily. Of Roses, red blooms are the most plentiful; other sorts on sale include Madame Butterfly, Columbia, Ophelia, Golden Ophelia, Roselandia and Mrs. Aaron Ward. A few blooms of Niphedus have been on sale during the past week, but very few blooms of this variety are grown for market now, and the white Molly Sharran Crawford will be greatly welcomed. Carnations, like all other subjects, have been reduced in price owing to the increased supplies, which exceed the present demand. Cut white Hydrangea is now available in limited quantities. Spanish Irises are arriving in excellent condition and more varieties are on sale, the colours including blue, white, yellow and mauve; the prices of these flowers are on the down grade. The quantities of Richardias (Arums) still exceed the demand. Lilium longiflorum is a trifle firmer in price. The values of Tulips are similar to those of last week. Darwin varieties vary in price, according to their quality and condition. More foliage has been on sale, and prices are on the down grade for all species of Asparagus also Maiden-hair Fern. In the French department, supplies have been very heavy during the past week. Double white Stock and Allium (Star of Bethlehem) have been most in demand. Most of the single Anemones have been most affected by the milder weather and have reached the market in a very blown condition. Freesias, Marguerites, Marigolds and Parma Violets have been more reliable, and prices for the last have been the lowest this season.

REMARKS.—Business has been variable; the volume of produce shows considerable increase amounting, in some sections to a glut, bringing down values unduly low. In the case of South African fruits, although the quantities were extremely heavy, prices have held remarkably well. The fruits being imported at the present time consist mainly of Pears, Plums, Grapes and Peaches, and they are selling fairly freely. The first consignments of the year of Apples from New Zealand are on offer and making satisfactory prices, especially Cox's Orange Pippin. The first shipment of Australian Apples is due this week; at present we are receiving Pears and Grapes from that Continent. Apples are still available from the United States and Nova Scotia, as well as a few home-grown fruits. Forced Strawberries although very dear, are meeting a good demand. The Cucumber trade is inclined to be easier in consequence of increased supplies. A few

Tomatoes from the Worthing district are making high prices. Mushrooms, during the present week, were in heavy supply, but at the time of writing, there is a hardening in price, due to smaller quantities. French Beans are a good trade and their prices have recovered somewhat, compared with a week ago. Asparagus is quoted lower on increased consignments from France. Cauliflowers have been a drug on the market, and hundreds of crates have been sold at prices barely covering the cost of freightage. New Potatoes from Guernsey are a good trade, and new Potatoes from the Canary Islands are also selling well. Green vegetables are a quiet business, and salads are quoted cheaper. There is no change to report in the trade in old Potatoes, good varieties only being enquired for.

## GLASGOW.

The cut-flower market was under the influence of the weather last week. As a result of the heat wave, over 63° in the shade were registered on Monday. Tulip blooms arrived in a blown condition, and Daffodils were sold. Prices were consequently not an index of the true value of the flowers, and salesmen were in the position of having to accept whatever sums were offered. Daffodils were slow to move even at the following attractive values: Golden Spur and princeps, 1/- to 1/6 per dozen bunches; Emperor, 2/- to 3/-; King Alfred, 4/- to 6/-; special 6/- to 9/-; and ornatus (outdoor), 4/- to 6/-; Indoor, 6/- to 8/- Tulip prices were mostly normal, Muriello being worth from 2d. to 6d. per bunch of 6, Bartington and Clara Butt, 5d. to 8d.; Tea Rose, 6d. to 8d.; Lucrétia and La Reine, 6d. to 9d.; Couronne d'Or and Prince of Austria, 6d. to 10d.; double yellow and White Hawk, 9d. to 1/-; Luisante, 10d. to 1/-; and Madame Krelage, 1/- to 1/4 (12's). Prices of Carnations ranged from 3/- to 4/- per dozen; Roses made 3/- to 6/- per dozen; Richardias, 4/- to 6/- per dozen; Anemones 6d. to 1/-; Irises, 3/- to 3/6; Lily-of-the-Valley, 2/6 to 3/- per bunch; Lilac 1/-; Violets, 3d. to 6d. per dozen bunches; and Asparagus, 9d. to 1/6. Wallflowers of good quality sold for 1/9 to 2/3 per dozen, and Tomato plants, 1/- to 2/-.

In the fruit market Porto Rico Grape Fruit advanced 3/- to 24/- per case, and while the prices of Jaffa Oranges remained unchanged, those of Murcia counts were firmer, 300's making from 20/- to 24/-, and 400's, 20/- to 25/- Cape Pears were dearer at 6/- to 6/6 per case of 32 and 36, and 7/6 for 28; and Grapes were obtainable at 10/6 to 11/- for white, and 14/- for Colmar and Royake. The value of Canary Bananas fluctuated between 17/- to 22/- Pines averaged about 3/6 each, and Tomatoes varied from 12/- to 25/- per bundle, according to quality. The Apple trade was steady, Winesap being quoted at 11/- to 14/- per case; Newtown at 12/- to 15/6; Baldwin at 18/- to 22/- per barrel; and Greening at 22/- to 26/-.

New vegetables are plentiful, and their values reflected little movement one way or another. Cauliflowers sold at 4/- to 5/6 per crate; Carrots at 1/- per bunch; Turnips at 10d.; Chicory at 4d.; Seakale at 2/-; French Lettuce at 7/- (30) and Dutch at 6/-; Algerian Potatoes realised 34 per lb. Cucumbers 12/- per dozen, Endive, 2/-, and Rhubarb, 30/- to 36/- per cwt.

## ENQUIRY.

I SHOULD be glad if any of your readers can tell me where I can obtain V-shaped iron bars for use on the under-stages of Orchid houses and upon which the coke is placed. I have hitherto used corrugated zinc sheets, but as the coke is in a constant state of saturation, the sheets soon corrode and collapse. I saw an advertisement, two or three years ago of the bars I want to try, but, unfortunately, did not make a note of it at the time. H. Astley Bell.

## CATALOGUES RECEIVED.

CARTER AND Co., Raynes Park, S.W.20.—Lawns and Weeds.  
WM. POWER AND Co., 25, King Street, Waterford, Ireland.  
—Farm seeds.

## GARDENING APPOINTMENTS.

Mr. H. Norton, for the past two years gardener to LORD DENBIGH, Clifton, Beddington, as gardener to Mrs. SAMUDA, Brewern Abbey, near Kingtonham, Oxon. (Thanks for 2/- for R.G.O.F. Box.—EDS.)

Mr. H. S. Foster, for nearly twenty years gardener at Umberslade Hall, Warwickshire, and lately at Gledhow Hall Gardens, Leeds, as gardener to the EARL OF FEVERSHAM, at Duncombe Park, Helmsley, Yorkshire.

Mr. F. G. Clarke, for the past fifteen years gardener to H. MARTIN GIBBS, Esq., Barrow Court, Flax-Bourton, Somerset, as gardener to Col. The Right Hon. GEORGE A. GIBBS, Tyntesfield, Flax-Bourton, Bristol. (Thanks for 3/6 for R.G.O.F. Box.—EDS.)

## SCHEDULES RECEIVED.

DORSET HORTICULTURAL SOCIETY.—Exhibition to be held in Ranston Park, on Tuesday and Wednesday, July 26 and 27. Secretary Mr. H. R. Tuffin, Ranston Gardens, Blandford, Dorset.

BRITISH GLADIOLUS SOCIETY.—Exhibition to be held at Taunton on Wednesday and Thursday, August 10 and 11, in conjunction with Taunton Deane Horticultural Society. Secretary, Mr. A. E. Amos, 10, Bergholt Road, Colchester.

# SITUATIONS VACANT

Twenty words (or three lines, including headline), 4s., and 1s. for every succeeding eight words (or line or portion thereof). Fee for having replies addressed to this office, 1s. over and above the amount payable for all words appearing in the advertisement, including our own address.

Advertisers desiring their Advertisements repeated must give full particulars. Name and address alone are insufficient.

Gardeners writing to Advertisers of Vacant Situations are recommended to send them copies of testimonials only, retaining the originals. To part with original documents is to run a great risk of their being mislaid.

When addressing Box numbers, it is essential to give the initials or pseudonym as well as the correct number of the box.

## MUNICIPAL AND PUBLIC.

HERTFORDSHIRE COUNTY COUNCIL.  
ASSISTANT HORTICULTURAL INSTRUCTOR.

APPLICATIONS are invited for the post of a male ASSISTANT HORTICULTURAL INSTRUCTOR at the Hertfordshire Agricultural Institute, Oaklands, St. Albans. Salary £250 per annum, rising by annual increments of £10 to £300 per annum, with deductions for superannuation. Candidates must be not more than 35 years of age.

Application forms and particulars may be obtained on application to the undersigned. Last date for receiving applications 14th April, 1927.

CHARLES E. LONGMORE,  
Clerk of the County Council.

28, Castle Street,  
Hertford.

SOUTHGATE URBAN DISTRICT COUNCIL.

APPLICATIONS are invited for the post of HEAD GARDENER OF BROOMFIELD PARK (54 acres, including extensive gardens, greenhouses, two bowling greens, croquet lawn, grass and hard tennis courts, football and cricket pitches, running track, putting green, swimming lake, etc.). The duties will also include supervising the maintenance of the Council's Bowling Green in Grovelands Park.

Wages £3 15s. 0d. per week, with uniform and quarters in house in the Park, but not including heating and lighting.

The person appointed may be required to contribute to the Workmen's Pension Fund under the provisions of the Southgate Urban District Council Act, 1913.

Applicants must be qualified persons, of good health, with practical experience of maintenance of ornamental gardens and bowling greens, supervision of sports grounds, etc., and must not be over 40 years of age. Forms of application will be sent by the undersigned upon receipt of a stamped addressed foolscap envelope, and must be returned, with copies only of three recent testimonials, not later than 18th April next, to

A. E. LAUDER,  
Clerk of the Council.

Southgate Town Hall,  
Palmer's Green,  
London, N.13.

BECKENHAM URBAN DISTRICT COUNCIL.  
HEAD GARDENER AND CARETAKER.

THE Beckenham Urban District Council invite applications from experienced Gardeners to act (under the Parks Superintendent) as HEAD GARDENER AND CARETAKER at the Croydon Road Recreation Ground, Beckenham. Wages, £2 18s. 0d. per week, together with house (rent and rates free). The man appointed will be required to pass a medical examination and to contribute to the Superannuation Fund. Applications, giving age (which must not exceed 40 years) and previous experience, accompanied by copies of not more than three recent testimonials, to be addressed and delivered to the SURVEYOR to the Council, not later than Saturday, April 9, 1927.

F. W. GEDNEY,  
Clerk to the Council.

Council Offices,  
Beckenham.  
18th March, 1927.

EDMONTON URBAN DISTRICT COUNCIL.  
APPOINTMENT OF GARDENERS.

THE Edmonton Urban District Council invite applications from competent GARDENERS not exceeding 45 years of age, and who are members of a recognised Trade Union, for the above appointments.

The wages will be at the rate of £3 2s. 0d. per week, and the posts are established under the Local Government and other Officers' Superannuation Act, 1922, and the persons appointed will be required to contribute to the Superannuation Fund, and to pass a medical examination.

Forms of application and any further particulars can be obtained on application to the Engineer and Surveyor, Cuthbert Brown, M.Inst.C.E., Town Hall, Edmonton, N.9.

Applications, endorsed "Gardener," accompanied by not more than three recent testimonials, to be delivered to me, the undersigned, not later than 12 o'clock, noon, on Monday, the 11th day of April, 1927. Canvassing will disqualify.

By Order,  
FREDK. W. CLAXTON,  
Clerk of the Council.

Town Hall,  
Edmonton,  
29th March 1927.

**WANTED**, LADY FLORIST, able to take control floral dept.—Apply, full particulars and photo, JOHN E. KNIGHT & SON, Florists, Wolverhampton.

## SITUATIONS WANTED

*Twenty words 2s., and 6d. for every succeeding eight words or portion thereof. (Advertisements at this reduced rate are only accepted direct from gardeners and nursery employees). Fee for having replies addressed to the office, 1s., over and above the amount payable for all words appearing in the advertisement, including our own address.*

### SUGGESTIONS FOR ADVERTISERS.

*Before writing an advertisement, it is useful to look down the column and note the information contained in advertisements similar in character to your own. Important points which might otherwise escape the memory may thus be brought to mind.*

*Write the advertisement in the centre of a large piece of paper (for example, a whole sheet of writing paper laid out flat) leaving plenty of space at top and bottom. If the name and address are to be included in the advertisement, place them at the end; if a box number is to be used leave a generous space at the end of the advertisement, draw a line across the paper, and place the full name and address beneath the line.*

*No letter or request for insertion is required: but in case of any doubt as to the proper classification the name of the section (such as "Situations Wanted, Trade") can be placed at the head of the advertisement. Such words will not be printed or charged for.*

*It is important to send the correct amount in payment, as any variation causes delay (see rates at the head of each section).*

*No acknowledgment or receipt is sent in connection with these advertisements, but if an extra 7d. is added to the correct amount, a copy of the paper containing the advertisement will be sent post free.*

*An advertisement received after Tuesday may not, or received after Wednesday cannot, be inserted the same week; but if fully paid, it will appear the following week, unless countermanded in the meantime.*

## PRIVATE.

**HEAD GARDENER or GARDENER-STEWARD**.—The Hon. Constance Russell, Ampt-hill Park, Ampt-hill, Beds., highly recommends CHARLES TURNER, who has been Head Gardener at Ampt-hill Park for 10 years. First rate in every branch, and an excellent manager.—Reply, TURNER, at above address.

**HEAD GARDENER**, where several kept, desires change to similar position; life experience all branches, thoroughly efficient and trustworthy; upkeep good establishment; sale surplus if required; age 41, no family.—F. G., c/o Wm. Yandell, Castle Hill Nurseries, Maldenhead.

**THE LADY BATTERSEA** wishes to recommend C. BRIARS, HEAD GARDENER to the late Hon. Mrs. E. Yorke; used to large establishments and position of trust; age 43.—C. BRIARS, 57, Victoria Road, Netley, Hants.

## WILLIS BROS.' Garden Fertiliser

**THE BEST ON THE MARKET.**  
**NO STABLE MANURE REQUIRED.**  
For digging in or as a top-dressing. For kitchen Gardens or Herbaceous Borders.  
1 cwt., 15/-; ½-cwt., 9/-; 28 lb. 5/-; £14 10/- per ton. All Carriage Paid.

**LOOK TO YOUR VINES!**  
The Vine requires a large quantity of Potash for its proper growth and the development of fruit. WILLIS BROS. VINE MANURE contains 7% Potash, 22% Phosphate, and 4% Nitrogen, and the results justify us in saying it is the best on the market. The effect on old vines is very marked, it puts new life into them.  
1 cwt., 25/-; 56 lb. 14/-; 28 lb. 8/- All Carriage Paid

**LAWN MANURE.**  
Having been connected with the experimental manuring of pastures, etc., for over 40 years, we are in the position to offer the above with perfect confidence as to results. It is especially suitable for poor mossy lawns, improving the texture of the grass, and helping the lawns to keep their colour in dry seasons. Can be used at the rate of 5 cwt. to the acre.  
1 cwt., 20/-; 10 cwt., £9 15/-; 1 ton., £19. Carriage Paid. Special Prices quoted for Grass Manures for Park Land in quantities.

**LAWN SAND AND DAISY KILLER.**  
This preparation will be found very effective for thickening the sward and encouraging the grasses; also destroys the daisies and other weeds so troublesome on lawns. 1 cwt., 25/-; 10 cwt., £12. Carriage Paid.  
**DIRECTIONS FOR USE.**—Sprinkle thinly over the surface of the lawns at the rate of 4 to 6 ozs. to the square yard; where a mass of weeds occurs a little more may be used, as the grass cannot get through until the weeds are killed. A dry day in autumn or spring is the best time to apply the LAWN SAND.

**SUSSEX TRUG BASKETS.**  
18" 4/-; 20" 5/-; 23" 6/-; 26" 7/-; 28" 8/-; each. Carriage Paid.

**GARDEN SUPPLIES AT LOWEST PRICES.**  
Write for our List of Garden Manures and Horticultural Sundries. Free on application.

**WILLIS Bros. (HARPENDEN) Ltd.**  
HARPENDEN, HERTS.

## TURF, FIBROUS MOULD and LOAM

Prepared cultivated turf for best lawns, bowling greens, tennis courts, etc.  
Also **CLEAN MEADOW TURF FOR PLAYING FIELDS.**  
Large or small quantities supplied. Enquiries and inspection invited.

# RHODODENDRONS FOR EVERYONE

By F. KINGDON WARD.

**PRICE - 3s. 9d. - POST FREE.**

This fascinating work, published in 1926, has already proved exceedingly popular, and is rapidly commending itself to the gardening public, many of whose members are finding how much easier is the cultivation of these delightful flowering shrubs than they had imagined. There are very few gardens where they will not grow and flourish with ordinary, common-sense treatment, and their glorious blossoms are a perpetual feast to the eye. Capt. Kingdon Ward writes with authority, for he knows his subject at first hand, having had seven or eight years' experience of travelling in China and Tibet, where he discovered a number of new Rhododendron species.

## The Bizzarria Orange.

BELIEVERS in natural selection à l'outrance would have us behold Nature, "red in tooth and claw," practising the drastic law of economy with savage efficiency. But the Orchids and Strelitzias and even the Sundews, like the peacock and the many other elegant extravagances among plants and animals, show though she be, after the fashion of her sex, of realistic inclinations, Nature has in her—also likewise significant of the sex—more than a touch of romanticism. Now sober and severe, now exuberantly extravagant of form and colour, Nature but rarely descends to mere freakishness. When she does, like Medea, she generally devours her own children. Yet now and again so wide is the versatility of Nature, bizarre forms of life appear and persist. Of such forms none is more curious than the well-named Bizzarria Orange, which tradition maintains is the curious result which emanated from the hands of a Florentine gardener in 1644 as a result of the defective grafting of a Citron (*Citrus Medica*) with a Sour Orange (*Citrus Aurantium*). The monstrous progeny of this or some other unhappy union has engaged the attention of botanists

during the last three centuries, and needless to say, many "explanations" have been put forward to account for its peculiarities. Some have thought that the Bizzarria Orange is a true hybrid, but more recently it has been put in the category of plant chimeras. Mr. Tyôzaburô Tanaka of the Phytotechnical Institute of the Miyazaki College of Agriculture (Japan) has, we think now solved the problem by showing\* that this curious Orange is indeed a chimera, albeit a very peculiar one. His studies were carried out at La Mortola, where a dwarf Bizzarria tree grows. It is about a yard high and bears three kinds of foliage. The leaves on some branches are thick, deep green and winged—quite like those of the Sour Orange. Those borne on other branches are lighter, thinner, serrated and unwinged: these are Citron leaves. The third set—Bizzarria leaves—resemble those of the Sour Orange, but are irregular in outline, variable-shaped, with every form ranging from linear to oval, and sometimes as though to emphasise their bizarreness, somewhat variegated. The profound injunction "by their fruits ye shall know them," generally so sure a guidance to the systematist, breaks down completely in the case of this vegetable freak. For, as shown in Fig. 121 (p. 243), reproduced by the courtesy of Professor Punnett, Editor of the *Journal of Genetics*, the fruits of the Bizzarria are, if not so varied as the leaves, by no means uniform in appearance. The fruit, indeed, partakes of both progenitors. Half of it is Sour Orange and half Citron. The Citron part is very rough, longitudinally streaked with irregular striations, generally of yellow colour; the Sour Orange part, on the other hand, has an even surface and of green colour. But even in the Citron part green patches occur. The explanation given by the author fits these curious facts and appears to us to be conclusive. The Bizzarria Orange is a chimera produced, no doubt, from a bud formed at the union of a stock of Sour Orange and a scion of Citron. It is, moreover, a chimera made up of a core of Citron and a covering of Sour Orange. That is to say, it is a periclinal chimera: all the body, as it were, is Citron, and all the skin Sour Orange. As in other similar cases, *Cytisus Adamii*, for example, an uneasy relation exists between the two components. Ordinarily, these strange bed-fellows make the best of their linked fate, and like the lion with the lamb, the Sour Orange lies down with the Citron. But occasionally individuality is asserted. In some buds the confined Citron finds itself, or makes itself, free of the Sour Orange covering, and lo! it develops into a Citron branch. More rarely the bud is formed or comes to consist solely of "skin"; that is to say, of sour Orange tissue, and that bud gives a branch typical of the Sour Orange. Finally, in the fruit the confined Citron—from some cause still unexplained—adopts the method of infiltration. Strands of its tissues grow in among the tissues of Sour Orange and appear on the surface. In the lower half of the fruit illustrated in Fig. 121, this has taken place to such a large extent that the complexion there is that of the evader. In the upper part this penetration is so slight that half looks like Sour Orange pure. The invasion of Citron tissue into sour Orange rind is well shown in the section of the fruit. Nowhere in Nature may a better example be found of the intercellular struggle for existence which probably takes place between all the component cells of a tissue from which possibly arises all that fair harmony which seems to accompany normal development.

\* *Journal of Genetics*, Vol. 18, No. 1. March, 1927.

**Proposed Plant Collecting Expedition in Western British Columbia.**—Following the suggestion that has already appeared in our columns, the Council of the Royal Horticultural Society has decided to promote an expedition to Western British Columbia for the purpose of obtaining seeds and specimens of the many desirable garden plants, especially alpine, this region is assumed to contain. Much of the coastal, mountainous region of British Columbia is practically unexplored botanically and should yield interesting and useful plants that will be quite hardy in this country. A Committee has been set up to make the necessary arrangements, and it has been decided to divide the cost of the expedition into a number of £20 shares, so that others besides the Society who wish to do so, may participate in the results of the expedition. Applications for the available shares should be made to the Director, Royal Horticultural Society's Gardens, Wisley, Ripley, Surrey, before Monday, April 25, as arrangements must be completed quickly.

**Flowering Plants of South Africa.**—No. 24 of Vol. 6 of *The Flowering Plants of South Africa* contains illustrations and descriptions of *Protea cynaroides*, *Disa picta*, *Gladiolus hirsutus*, *Disa lacera*, *Watsonia Fourcadei*, *Disperis Tysonii*, *Gladiolus salmoneus*, *Watsonia tabularis*, *Lapeyrouisia fissifolia*, and *Gladiolus Watsonius*. *Protea cynaroides*, t. 231, is the largest of all the South African species and is the only known species which has long-petioled leaves. It forms a bush up to 2m. high, and is sometimes acaulescent. *Disa picta*, t. 232, is a rare species of which not more than five collections are recorded. The hooded flowers are marked with violet, and have a brownish keel. *Gladiolus hirsutus*, t. 233, is an old plant in gardens, and was illustrated in *Icones Plantarum Rariorum* about 1790; the flowers are one to six in a lax spike, and are pinky in colour. *Disa lacera*, t. 234, is another very small-flowered Orchid known as the Caledon Blue *Disa*; it is probably a form of *Disa lacera* which Rolfe included in *Herschelia venusta*. *Watsonia Fourcadei*, t. 235, is a new species with a spike, nearly five feet high, of very beautiful salmon-pink or coral-red tubular flowers. *Disperis Tysonii*, t. 236, is another small, terrestrial Orchid with a hooded dorsal sepal and wide side sepals coloured purplish-mauve. *Gladiolus salmoneus*, t. 237, was named by Baker from plants sent to Kew in 1883; the perianth segments are waved at the margins and are a shade of salmon-pink. The spike may contain so many as twenty flowers. *Watsonia tabularis*, t. 238, is a very handsome Iridaceous plant found on the Lower Plateau of Table Mountain; the long spike bears numerous showy flowers, the exterior of the outer segments being reddish-scarlet and the interior with mauvy suffusion. The flower stem, as shown in the illustration, is violet-purple. *Lapeyrouisia fissifolia*, t. 239, is another Iridaceous plant forming an erect, simple, sometimes branched, glabrous herb, and bears a spike of few or many flowers which have pink tubes and pale purple segments. *Gladiolus Watsonius*, t. 240, is an extremely graceful plant, usually bearing one to three bright red flowers; it is the *Antholyza revoluta* of Baker's *Flora capensis*, and known commonly as the "Red Africander."

**American Iris Society.**—At the meeting of the Directors of the American Iris Society, held in New York, the medal of the Garden Club of America, which had been offered to the Society for the best seedling Iris introduced in 1923, was officially awarded to the variety Morning Splendor, raised by J. Marion Shull, of Washington, D.C., and no other award was made for 1923 seedlings or for 1924 seedlings. An appropriation was voted to the New York Botanical Garden for the purpose of instituting research work in Iris breeding between species, this work to be carried out by students working under the direction of Dr. A. B. Stout. An appropriation was also made to the Brooklyn Botanical Garden to further the work in investigation of Japanese Iris begun some years ago by Dr. George M. Reed. It was announced that a new Iris Test Garden was being started at the Missouri Botanical Garden, where already about nine hundred varieties have been assembled. It is expected that special work on colour

classification will be undertaken there in the future. Announcement was also made of the special study of Dwarf Iris to be begun this year at the Cornell Test Garden under the direction of Dr. A. H. Wright. The lantern slides owned by the society are now in the custody of Mrs. Silas B. Water, Edgecliff Point, Walnut Hill, Cincinnati Ohio, and they may be rented by Garden Clubs and other horticultural organisations. Arrangements were made to hold the annual meeting of the Society at the Brooklyn Botanic Garden, on Friday, June 3, but subject to change according to season. After the business meeting, the Irises at the Brooklyn Botanic Garden will be inspected and the research work explained to the members. After lunch, an automobile trip will be made to several famous Iris collections on Long Island.

**Arsenic on Imported American Apples.**—In reply to a letter asking whether anything is now being done by American growers to safeguard the consumer of exported Apples, Mr. Frank Wyatt, Secretary of the London Vegetarian Society, has received the following letter from the Department of Agriculture at Washington. "The American fruit-producing industry is fully alive to the necessity for eliminating dangerous quantities of spray residue on fruit, and is working whole-heartedly with both Federal and State Governmental agencies who are concerned with this problem. Intensive studies, designed to control the spray residue on fruit, were made during the last producing season by both Governmental and commercial agencies. While a great improvement in the condition of the crop was brought about, it was found that in certain areas of low rainfall, even the most careful restriction in the application of sprays, followed by brushing and wiping the fruit after harvest, left excessive quantities of residue on the fruit. This demonstrated clearly the necessity for employing other methods of removing spray residues than by brushing or wiping. Experimental work conducted last season in a number of localities where spray residue may be excessive at the time of harvest has shown that by the employment of certain dipping methods the fruit may be cleansed to a point where the amount of residue will be well below the recognised tolerance. Steps are now being taken to advise the fruit-producing industry, in those regions where fruit cleansing is essential, of the equipment and processes necessary in the application of these different methods, and every thing possible will be done to bring about the installation of this equipment before the next packing season. It is expected that as a result of the combined effort of the fruit-producing industry and interested Governmental agencies, none of the fruit exported to Great Britain during the coming season will bear objectionable quantities of spray residue."

**Conference of Bulb Growers and Dealers.**—Under the auspices of the Horticultural Trades Association a National Bulb Conference of bulb growers and bulb dealers will be held at the London Central Y.M.C.A. (junction of Tottenham Court Road and Great Russell Street, London, W.1.), on Wednesday, April 13, at 2.30 p.m. Those who attend will be asked to consider: (1) whether or not it is in the interests of the British Bulb Industry to make application under Section 1 (3) of the Merchandise Marks Act, 1926, for the exclusion of bulbs from the operation of this Act, and to arrange accordingly; and (2) the action of the Office of Works in accepting and advertising a gift of Dutch bulbs for planting in the Royal parks.

**Birmingham Botanic Society's Show Postponed.**—We regret to learn that in view of the very short time available for arranging a show this year, the Organising Committee has decided to postpone until the spring of 1928 the show it had proposed to hold in the Edgbaston Botanic Gardens early in June, 1927.

**Centenary of Heidelberg Public Gardens.**—Heidelberg is celebrating this year the centenary of the first public gardens formed in the town, which were laid out in 1827 on the site of the old moat. It was then that the finest avenue in the town, now the Leopoldstrasse, was planted with Horse Chestnuts. Since then, the town

has acquired many other fine parks and gardens; the Handschuhsheimer Park, until 1916 in private hands, contains a celebrated specimen of Ginkgo biloba, and a Tulip Tree twenty-five metres in height. For supplying plants to the parks there is a municipal nursery with twelve large greenhouses and about four hundred frames.

**Mr. James Friend.**—After faithful and much appreciated services with the Glyn family, extending over a period of nearly fifty years, Mr. James Friend, whose portrait we have pleasure in reproducing, retired on March 25, last from the management of the estate and gardens at Albury Hall, Hertfordshire, the seat of the late Maurice Glyn, Esq. Mr. Friend had considerable experience in gardening before he was appointed general foreman at Iwerne Minster, Blandford, the seat of Lord Wolverton, which marked the commencement of his forty-six years' service with the Glyn family. He was born at Felbridge, Surrey, and commenced his horticultural career at Chartham Park, in the same county; his next appointment was as journeyman at Croxteth Park. On leaving Croxteth Park he obtained an appointment through Messrs. James Veitch and Sons,

MR. JAMES FRIEND.

of Chelsea, at Luton Hoo, and from Luton Hoo he was appointed foreman at Quorn Lodge, Loughborough. He again returned to Messrs. James Veitch and Sons, Chelsea, and they recommended him for the post of general foreman at Iwerne Minster, where he remained for eight years, when he was offered and accepted the post of gardener and bailiff at Rooksnest Park, Godstone, the seat of the Hon. Pasco Glyn, brother of Lord Wolverton. Mr. Friend remained at Rooksnest for over twenty years, and on the death of the Hon. Pasco Glyn, his son, Mr. Maurice Glyn, bought Albury Hall, Hertfordshire, and entrusted Mr. Friend with the whole management of the estate. Mr. Friend has won many prizes for Chrysanthemums, fruits and vegetables in competition with many well-known growers at the shows held in the Aquarium, Westminster, at the Crystal Palace, etc. Those who know Mr. Friend personally realise that he is a man of kindly nature, and he is greatly esteemed by the numerous young gardeners who have passed under his charge. He is shortly taking up his residence at Stansted, Essex, where, after much hard work and valuable service, all will wish him good health and happiness to enjoy his well-earned rest.

**Old-fashioned Plants.**—A novel exhibition is being held just now in the Botanic Garden in Dresden—an exhibition of old-world room-plants. The collection has been brought

together by the Director of the Gardens, Professor Dr. Tobler, and has been visited by a number of people, many of whom were surprised to see again old, long-forgotten favourites.

**Horticultural Education in Belgium.**—Each year the Belgian Ministry of Agriculture organises free lectures and courses of study on the subjects of fruit cultivation, market gardening, and horticulture. The requests for such classes are made to the Ministry by the local councils, or societies, who are required to provide, free, halls for the lectures, and also gardens for demonstration suitably cultivated and planted with fruit trees. The Ministry also frequently assists in the expenses connected with the organisation of horticultural and agricultural exhibitions if the authorities are satisfied that such assistance is needed and will be usefully applied.

**Legacy for a Gardener.**—The late Sir Benjamin Faudel-Phillips, Bt., of Balls Park, Hertford, who died on January 11, left an annuity of £104 and a legacy of £100 to Mr. Frederick Fitch, his gardener, if still in his service, and an annuity of £52 to his wife, should she survive him. The gardens at Balls Park were maintained by Mr. Fitch in a condition of great perfection.

**Worshipful Company of Gardeners.**—Mr. Ernest Arthur Ebbelwhite has completed twenty-five years' uninterrupted service as Clerk to the Worshipful Company of Gardeners, and the Court has appointed a Committee of which the Right Hon. The Lord Mayor of London is Hon. Treasurer, to raise subscriptions for presenting Mr. Ebbelwhite with a testimonial in appreciation of his unremitting zeal and energy in the best interests of the Company and its members.

**Canadian Apple Exports.**—The total exports of Apples from Canada this season, up to March 3, amounted to 605,895 barrels, 9,877 half-barrels, and 840,479 boxes, as compared with 1,085,968 barrels, 13,828 half-barrels, and 628,149 boxes during the same period last year.

**Daffodil Conference at Westminster.**—On April 13, the second day of the London Daffodil Show, a Daffodil Conference will be held at the Royal Horticultural Hall, commencing at 11.30 a.m., when Mr. P. D. Williams, and Mr. P. R. Barr, will deliver short addresses. Mr. P. R. Barr will discuss "Miniature Daffodils and Their Place in the Garden," and illustrate his remarks by plants of the smaller species and varieties.

**The Flower and Plant Industry in England and Wales.**—According to the Ministry of Agriculture, the value of the flowers, bedding plants, decorative plants, etc., grown for market in England and Wales during 1925 was £1,750,000, representing a value of £400,000 for flowers grown in the open and £1,350,000 for bedding plants, flowers, etc., grown under glass. Of the out-door flowers, the most important are Daffodils and Narcissi, which account for about 1,400 acres. Tulips come next with 300 acres, followed by Violets with 150 acres. Other flowers represent a total of 3,400 acres. Most of the Daffodils and Narcissi are grown in Lincolnshire, Cornwall, Norfolk, Essex, Middlesex and West Sussex. Tulips are grown principally in Lincolnshire and Norfolk, whilst Devonshire and Cornwall furnish the bulk of the Violets. The total acreage of flowers grown in the open is about 5,250.

**Preparing Herbarium Specimens.**—Mr. E. M. Marsden-Jones and Mr. W. B. Turrill, at the Linnean Society's recent meeting, gave an account of an improved herbarium method for geneticists, ecologists and taxonomists. The method demonstrated originated, so far as the exhibitors were concerned, with Professor W. G. Craib, of Aberdeen. It has been used at Kew for some years and, with minor modifications, is capable of very wide application. With the hope that ecologists and geneticists especially would recognise the necessity of keeping as records the actual specimens with which they have worked, some examples of the results of the method were submitted. Briefly, the process is the sticking down of the specimens in a

living condition. The best results have been obtained with paste, not with gum or glue, "Gloy" being the best so far tested. A sheet of paper or card is brushed over with a thin layer of the paste, and the specimens placed on this. They are dabbed down and excess of paste wiped away. The sheet is then placed in a press and considerable pressure applied. It is advisable to look at the preparations within a few hours and remove any excess paste. After a few days the specimens are dried; they retain their shape, and sometimes their colour, indefinitely. The most useful results are obtained with dissected flowers and inflorescences; all parts of the flower may be shown with upper and lower surfaces visible, and sections can also be stuck down for drying in position. With some plants, pressure through blotting paper with a hot iron gives excellent results. For taxonomy the need for boiling and dissecting is practically eliminated when series like those shown are available. In such a family as Zingiberaceae and in such a genus as *Iris*, without a method like this, herbarium work is largely hopeless. In genetical studies it has been found most valuable, not only in making ordinary herbarium specimens of entire plants for future reference, but also in having series showing various floral and other organs on cards. In work on *Geum*, herbarium sheets of the distinct forms resulting from the crossing of the British species were prepared, and on cards complete sets of the petals and calyces of all plants raised were kept. A herbarium prepared in this way would become more and more valuable, for no experimental ground is large enough to keep growing all the plants which have been worked with; but with the above plan a record is preserved. The importance of an ecological herbarium would also be enhanced by adoption of the method or a modification of it. Dr. Rendle referred to the specimens of *Iris* prepared by the late Mr. Dykes, and Mr. H. N. Ridley mentioned Mr. Maw's *Crocus* specimens as comparable with the exhibits before the meeting, and touched upon the limitations of the method and the difficulties likely to be encountered under the usual conditions of collecting in the tropics.

**Ashridge Park.**—Ashridge Park, near Berkhamstead, an open space in the Chiltern Hills, lately acquired for the public by the National Trust, will be open from now onwards on Saturdays, Sundays, and Bank Holidays. The portions of the park included in the purchase are well-wooded; outside the park walls there are beautiful glades of Beech and a most interesting walk to Beacon Hill which commands distant views of the countryside.

**New Director of Cologne Municipal Gardens.**—We referred in our issue of January 29 last (p. 75) to the retirement of Herr Encke, the Director of the Municipal Parks and Gardens of Cologne. We now learn that his successor is Herr Josef Giesen, the Director of Cultivation in the municipality. Herr Giesen is thirty-nine years old; he entered the service of the Parks Department in 1919, and has held various positions of increasing responsibility. He will have the practical direction of the large area of new parks and gardens which are to take the place of the old fortifications round the city. Another official who will also be closely concerned with the lay-out of these new open spaces is Herr Theo. Nussbaum, who is at the head of the planning and designing department of the municipality. To him will fall the responsibility of designing the new parks so as to make the best use of the available ground. Herr Nussbaum is forty-one, and has been in the municipal service since 1910. He has won many prizes for garden designs, and among other works for which his plans have been accepted may be mentioned the stadium grounds at Elberfeld, Oberhausen, and Wiesdorf, and the cemeteries at Buer and Celle.

**Appointments for the Ensuing Week.**—**MONDAY, APRIL 11:** United Horticultural Benefit and Provident Society's meeting; Guildford and District Gardeners' Society's meeting. **TUESDAY, APRIL 12:** Royal Horticultural Society's Daffodil Show (two days);

Jersey Gardeners' Society's meeting. **WEDNESDAY, APRIL 13:** Sheffield Chrysanthemum Society's meeting. **THURSDAY, APRIL 14:** Tewkesbury and District Daffodil and Spring Flower Society's show; Ipswich Gardeners' Association's meeting.

**"Gardeners' Chronicle" Seventy-five Years Ago.**—*Hardiness of Greenhouse Plants.*—As the question of the hardiness of many plants usually treated as greenhouse ones appears to be exciting some attention, and as several plants of that description have been for some years planted out here with a view of testing their hardiness, the following account of the

vigorous, and seems as hardy as *L. grandiflorum*. *L. scoparium*, tried a few years ago, was killed; *Grevillea rosmarinifolia* is perfectly hardy, and is now in flower. *Callistemon lanceolatus*, *Plagianthus divaricatus*, *Tasmannia aromatica*, *Veronica speciosa*, have also been tried successfully against a wall. The *Tasmannia* usually flowers abundantly. *Clianthus puniceus* against a wall is now coming plentifully into flower. *Acacia affinis*, with a stem one foot in circumference, is now covered with blossom; it is planted out in a sheltered situation. *Other Plants of Doubtful Hardiness.*—*Habrothamnus elegans*, *corymbosus*, and *fascicularis*, against a wall, are uninjured. *Ioichroma tubulosum*,

FIG. 121.—THE BIZZARRIA ORANGE.

Upper: left, cross section; right, apical view. Lower: left, basal view; right, side view showing the typical narrow, boat-shaped leaves.

(see p. 241).

result may be interesting. It should be observed that this place, lying on the shores of Morecombe Bay, shares in the mild climate of the west of England; but being considerably to the north (in latitude 54°11'), and only a few miles distant from the lake mountains, which rise to the height of 3,000 feet, it is liable to greater cold than usually occurs further to the south. *Australian and New Zealand Plants.*—*Leptospermum grandiflorum* has been planted out many years, and always flowers abundantly. It appears as hardy as any of the common evergreens. *Leptospermum ambiguum* and *L. lanigerum* have also been out two winters against a wall, and are quite safe. The latter, especially, is very

under precisely the same circumstances, was killed. The following plants appear also to be quite hardy. *Quercus glabra* (very handsome); *Tetranthera Sieboldi*? (do.); *Limonia laevis*; *Illicium floridanum*; *Ill. religiosum* (both of these flower); *Garrya Macfadgiana* (against a wall); *Myrsine africana*, *M. Urvillii*? *Euonymus fimbriatus* (against a wall); *Eriobotrya japonica* (do.). *B., Holkar Hall, Miln-horpe, April 7. Gard. Chron., April 10, 1852.*

**Publication Received.**—*The Field Club Flora of The Lothians*, published by the Botanical Committee of Edinburgh Natural History Society, 13, Atholl Crescent, Edinburgh.

## The Week's Work.

### THE ORCHID HOUSES.

By J. T. BARKER, Orchid Grower to LADY LEON,  
Bletchley Park, Bletchley, Bucks.

**Dendrobiums.**—In most cases, the species and numerous hybrids of the *Dendrobium* nobile section commence to make new growth immediately they pass out of flower, and develop new roots from the bases of the young growths when the latter are a few inches high. Those that are in need of new rooting material should receive attention at this stage of their growth, for if the roots are allowed to attain any length there will be a danger of many being broken during the operation of repotting.

**Compost.**—*Dendrobiums* root freely in a mixture of equal parts *Osmunda* fibre, A.I. fibre, and fresh *Sphagnum*-moss, cut into somewhat small portions. Ordinary flower pots or pans, without side-holes, are suitable receptacles, and the material should be placed in them firmly. All the plants will not be ready for receiving fresh rooting-material at one time, therefore it is advisable to examine the stock from time to time, until all have received this attention. Strong, healthy specimens may be repotted without much disturbance at the roots, breaking the pot or pan if necessary, removing any useless back bulbs, and providing another receptacle of a suitable size. Over-potting must be guarded against, as *Dendrobiums* resent a mass of compost about their roots, even of such an open nature as the one advised. Plants with a large number of back pseudo-bulbs, which show signs of deterioration, should be shaken out of the old material, the dead roots cut away, and the number of back bulbs reduced to two or three behind each growing point. They may then be accommodated in much smaller pots or be placed several together, but the best results are generally attained by placing them in single pots or pans, according to the variety. Large, strong growers are best grown on the plant stages, whilst the smaller growers will do best in pans which may be suspended from the roof-rafters. At the present time there is every appearance of these *Orchids* again being much sought after, especially *D. nobile nobiliss* Sir F. Moore and *D. Thwaitesiae*.

**Watering.**—For some time after repotting them, the roots should be given only sufficient water to maintain the plant in a plump condition, as the young growths and roots will decay if water is given in excess; when the plants are well-rooted the supply of moisture should be increased gradually. *Dendrobiums* require considerable warmth and plenty of atmospheric moisture whilst they are making their growth, and only need shading from bright sunshine during the hottest part of the day.

### THE KITCHEN GARDEN.

By R. H. CROCKFORD, Gardener to THE RT. HON. LORD  
WAVERTEE, Horsley Hall, Gresford, N. Wales.

**Peas.**—Wrinkled or Marrowfat varieties may be sown in the open, on deeply trenched, well-manured ground. Further sowings should be made about every ten days until June in order to maintain an unbroken supply throughout the season. Do not sow thickly, or mildew will be troublesome later on the crowded foliage. Double rows, four feet six inches apart, and not less than two inches between the seeds, is a fairly safe distance, while more space should be allowed for very strong-growing varieties. Early attention should be given to the staking of earlier-sown Peas that may now require it. Stir the soil in the rows with the Dutch hoe on frequent occasions.

**Parsley.**—Seeds of this useful herb may now be sown out-of-doors. The ground for Parsley

should be in good heart and contain a fair amount of humus, or the foliage will be poor. Parsley may be planted as an edging to a border or alongside a path. Keep the seedlings well-dusted with old soot, or slugs will destroy them. When large enough, thin the seedlings to about four inches apart.

**Carrots.**—The main sowing of Carrots may now be made on deeply-worked, fertile ground that has not been manured recently. A fine tilth is very important for a seed-bed, and a liberal dressing of burnt garden refuse scattered over the surface and well raked in before sowing, will prove very beneficial. Make the drills about one inch deep, and allow a distance of fifteen inches between the rows. Good coloured varieties of the Intermediate section generally prove most serviceable for this sowing, especially where the soil is a deep, sandy loam. For soils which are not well suited to growing Carrots, choose stump-rooted varieties. To obtain roots for exhibition purposes, make holes with an iron bar, about eighteen inches to twenty-four inches deep, and fill them firmly with a finely-sifted, sandy compost, to which a little bone-meal, soot and burnt refuse has been added. Sow a few seeds at each station and ultimately thin to one strong seedling. So soon as the seedlings appear, keep the bed dusted with old soot, and use the Dutch hoe freely.

### FRUITS UNDER GLASS.

By F. JORDAN, Gardener to COLONEL SPENDER CLAY, M.P.,  
Ford Manor, Lingfield, Surrey.

**Successional Vines.**—Vines in various stages of development require constant attention, and each operation should be performed at the proper time. After disbudding is finished, the shoots will develop rapidly, and in a few days the more forward ones may be divested of superfluous bunches, stopped and tied in position. The last operation should be done with great care; the shoots of some vines are more tractable than others when bending them, but in all cases the pressure to bring the shoots down to the wire should be very slight; the principal object is to guard against the shoots touching the glass. Remove all superfluous bunches, if not before, immediately after, the berries are set, and utilise the scissors for thinning early. The temperature of the house in which Muscats are coming into bloom may be 68° to 70° at night, and up to 85° by day, with a rather drier atmosphere and free circulation of air on all favourable occasions. Tap the vines daily to disperse the pollen; draw a brush over free-setting varieties and afterwards use the brush on the Muscat bunches as well as shake the pollen on it about the house. After the bunches are well set, syringe the vinery once and gradually allow the night temperature to fall to 65° on cold nights. Give every attention to watering the borders and feed the roots with diluted liquid manure and vine manures when stimulants are considered necessary.

**Early Pot Figs.**—Early Figs in pots are developing white, fleshy roots over the sides of the receptacles in search of fresh food and moisture. Their development should be encouraged by spreading sods of turf on the rims and well over the sides of the pots. This attention does not justify neglect of the roots within the pots, which should be given warm, diluted liquid manure, and the turf and plunging materials kept constantly moist. Some of the earliest fruits will soon begin to swell. Up to this stage frequent syringings and plenty of atmospheric moisture are very necessary, but when the fruits are ripening reduce the amount of syringing, and keep the atmosphere slightly drier. Keep all gross shoots pinched, and remove weak or crowded growths as they appear. By these means, and a temperature ranging from 60° to 65° at night, with a little air, and 70° to 80° on bright days, the fruits will attain their fullest size and ripen quickly; the young shoots with small fruits will also get well advanced for successional fruiting.

**Strawberries.**—Continue to introduce fresh batches of plants to the forcing house as the earlier plants are cleared out. Give attention

to thinning the trusses early, and continue to syringe the plants freely. The roots will require to be fed with diluted liquid manure daily. To secure berries of the finest flavour, the plants should have plenty of air and a cooler and drier atmosphere for a few days after they are coloured.

### PLANTS UNDER GLASS.

By T. PATEMAN, Gardener to SIR CHARLES NALL-CAIN,  
Brockton Hall, Hertfordshire.

**Humea elegans.**—The earliest plants of *Humea elegans* should be ready for placing in the pots in which they will flower. I am not in favour of large receptacles for these plants; pots seven inches in diameter are the largest used in these gardens, the roots being stimulated with frequent light applications of liquid manure. *Humeas* resent disturbance at the roots, and in repotting them extra care must be exercised; on the contrary, failures may be traced to allowing the young plants to become pot bound before placing them in their flowering pots. If the roots are allowed to become an entangled mass, they are some time before they become established in the new compost, and if they are over-watered under these conditions the foliage will turn sickly, and the plants fail to grow satisfactorily. This plant requires cool treatment at all stages of its growth, and any attempt to hasten its development by the use of fire-heat would probably end in failure. Green and white fly are sometimes troublesome but these may be kept in check by the use of Cyanogas, used strictly in accordance with the directions given by the makers.

**Browallia speciosa major.**—Plants raised from seeds sown early in the year, should be kept growing. Prick them off into pots or small boxes, and when they are large enough, transfer them singly to small pots. *Browallias* enjoy a light, rich compost to which may be added some old Mushroom-bed manure or dry cow manure. Keep the young plants growing in a genial atmosphere, but when they are established in pots they should be accustomed to cooler conditions.

**Begonia Weltoniensis and B. gracilis.**—These useful summer and late autumn-flowering *Begonias* are still worthy of cultivation. Some of the old plants may be taken out of their receptacles, the old soil shaken from the roots and the plants repotted. They should make good flowering specimens during the late summer, while young stock raised from cuttings now will make good flowering plants for the autumn. These *Begonias* are very easily cultivated; although they will succeed under cool greenhouse treatment, much better results are obtained when they are started into growth in a somewhat humid atmosphere and gradually accustomed to cooler conditions.

### THE FLOWER GARDEN.

By JOHN COUTTS, Assistant Curator, Royal Botanic  
Gardens, Kew.

**Raising Hardy Perennials from Seeds.**—Many herbaceous perennials and choice rock garden plants are easily raised from seeds, and the present is a suitable time to sow them, as the bulk of seed-sowing for ordinary bedding purposes is over, and by the time the seedlings of the herbaceous subjects are ready to handle there should be plenty of frame room available. The seeds should be sown in pots, seed-pans or boxes, according to the quantities of plants required. Germinate them in a cool house or cold frame. Keep the soil shaded until germination takes place, and when the seedlings are large enough to handle, prick them off into boxes, and later, in the nursery or reserve garden. Many plants, such as *Delphiniums*, will, if very well grown, make a good show next year.

**Transplanting Hollies and Other Evergreens.**—Many evergreens, such as *Hollies* and evergreen Oaks, cannot be transplanted successfully

unless it is done at the proper time. Early autumn, while the ground is still warm, is suitable, but, on the whole, the best time is during April and early May, when the plants are just starting to grow. If the plants are of considerable size, they should have been prepared previously at the roots for transplanting. Evergreens should be planted firmly; in fact, firm planting is one of the secrets in the successful transplanting of most woody subjects. Give the roots a copious watering, and see that they do not suffer for lack of moisture in hot summer weather. Large evergreens should be partially cut back when they are transplanted.

**Begonias.**—Plants of the tuberous-rooted and *semperflorens* sections raised from seeds sown early in the year should be ready for planting out in cold frames. The beds should be prepared carefully, adding plenty of well-decayed leaf-soil or old Mushroom bed manure to the soil. In this compost they should root and grow freely, and lift with a good ball of soil and roots at planting out time.

**Salvia splendens and Verbena venosa.**—These two flowers may be grown in the way recommended for the Begonias as may any plant that has a good fibrous root system. Grown in frames, they require much less attention as regards watering. When the plants are first put in the frames, the latter should be kept fairly close and moist and well-covered at night to conserve as much sun warmth as possible.

**Thinning Herbaceous Perennials.**—Many herbaceous plants, such as Asters, Heleniums, Helianthus and Phloxes, should have their shoots well thinned now. This will result in much finer flowers, and the plants usually last longer in bloom, producing branches or side-shoots down to the ground. In the case of Phloxes, the young shoots may be used as cuttings, dibbling them into cold frames; if planted out when rooted, they will flower during the autumn.

### FOR NORTHERN GARDENERS.

By A. T. HARRISON, Gardener to the MARQUIS OF AILSA, Culzean Castle, Maybole, Ayrshire.

**Richardias.**—Arum Lilies are usually in great demand for Easter, and the development of the spathes may be hastened by keeping the house a few degrees warmer or, if too forward, the plants should be shaded or removed to a shady north house from which frost can be excluded. Under these conditions the flowers will last in good condition for a considerable time. Aphis is one of the worst enemies of this plant, and a close watch should be kept for the first appearance of fly, and measures taken to destroy the pest, either by fumigating or spraying the plants with an insecticide. In the milder parts of the country these plants may be grown successfully as aquatics, and if given the correct depth of water to ensure that the crowns are well below the surface in times of hard frost, they will last for a considerable number of years without further protection; a depth of eighteen inches to two feet of water is suitable, and they should be placed in position some time during May.

**Lawns.**—Grass is beginning to grow freely and lawns will need immediate attention. Wormcasts should be brushed level and the lawn rolled in preparation for mowing. Where the surface of the lawn was dressed with sea-sand late in the autumn, the smaller particles will now be washed well down to the roots of the grasses, and any pebbles or shells should be swept up and removed. This dressing is recommended for bowling greens, where a fine, close sward is essential, and where smoothness of surface is one of the principal considerations.

**Vineries.**—Late vines are growing rapidly, and where the rods have been allowed to hang free from the trellis, or in the case of young canes that have been bent down to encourage the more equal distributions of sap, they should be trained in their proper positions. Care is required

in doing this, as the young buds are very brittle and easily rubbed off, and although an odd one in the case of old spurs is no great loss, it is often the best or most forward bud that suffers injury. When the rods have been tied in position the superfluous shoots may be removed leaving only sufficient to furnish the available space, after examining them closely to make certain that the embryo bunch is showing. It is a wise precaution to leave two shoots for a time, as until they are finally attached to the laterals, they are liable to be snapped off at the base, and should the second one not be required, it is easily removed at a later stage when it is evident that the better one is secure. More moisture is now necessary, and theinery should be damped thoroughly on sunny, warm days. Examine the border, and if the soil is on the dry side, soak it well with tepid water.

**Sweet Peas.**—Plants of Sweet Peas raised under glass from a sowing made in January are filling their pots with roots, and if properly hardened off, may be planted in their summer quarters. If the trenches were made ready in good time, the soil should be consolidated, and if ample supplies of manure, etc., were used, the trench

raised from autumn sowings should be transplanted to form a succession, and seedlings from spring sowings thinned, and the soil about them hoed frequently.

### MY SMALL GARDEN.

WHEN taking over the site of my small garden, the only vegetation was an abundance of weeds and a few old-established fruit trees. These Pear, Apple and Greengage trees form a distinct feature, and provide a charm by reason of the decorative effect they produce at all seasons, and especially when in flower. The Greengage seen in the left front of the photograph (Fig. 122) produced ten pounds of fruit last year—a most fortunate occurrence, apparently, as I have been told this tree fruits only once in seven years!

In laying-out my small garden, I aimed at securing an idea of spaciousness combined with a minimum amount of labour in up-keep. Keeping this idea in mind, I devoted considerable space to lawn, with a broad herbaceous border all round, edged with a brick path. To provide a screen by the road way, I planted

FIG. 122.—THE GARDEN AT PEAR TREE COTTAGE, EWELL, SURREY.

should now only require a light stirring on the surface to ensure ideal planting conditions. For convenience in cutting, it is recommended to plant in rows or blocks of one variety or colour, but for garden effect mixed rows are charming, and it is not yet too late to sow Sweet Peas for this purpose in the open. So soon as the plants raised under glass are put out, they should be given the protection and support afforded by placing short, twiggy branches of Spruce or other suitable trees around them. A close watch must be kept for slugs, which will soon damage tender plants at this season of the year.

**Cabbages.**—The autumn-planted Cabbages are growing and hearting rapidly, and their development may be greatly assisted by an application of sulphate of ammonia between the rows, and stirring the surface soil. The application of this fertiliser is sometimes recommended earlier in the season, but when applied too early, it has a tendency to encourage excessive leaf-growth, at the expense of early hearting. So soon as the plants show signs of "bowing," or hearting, is the most effective time, and when the sulphate is applied just before rain the results are soon apparent in the darker green of the foliage and increased vigour of the crop. Plants

evergreen and flowering trees and shrubs, such as Cupressus macrocarpa, Laburnum, Lilac and Robinia; these are now thriving and bid fair to fulfil their purpose.

In the flower borders I grow Michaelmas Daisies in variety, hardy Chrysanthemums, Hollyhocks, Delphiniums, Lupins, Pyrethrums, giant Poppies, many varieties of Phlox and Antirrhinums, with borderings of Pinks, Violas and Thrift.

A little formal Lily pond was made and the soil excavated in its making formed the base of the rock garden, a portion of which is seen in the photograph. A red Nymphaea, Japanese Irises, goldfish and carp flourish in the pool, while in the interstices of the stone edging are mosses and Saxifrages. By the margin of the pool are tubs of Agapanthus, three blue and one white.

In the grass around the fruit trees, Snowdrops, Crocuses and Primroses bloom in due season and are very effective. Although not shown in the photograph, there is a bed of Roses near the sitting-room window, and Tulips and Violas are planted between the Roses.

Altogether—trees, lawn, flowers, paved paths and sundial provide a beautiful, interesting and peaceful garden. (Mrs.) J. M. Wilson, Pear Tree Cottage, Ewell.

## ORCHID NOTES AND GLEANINGS.

## THE NIVEUM GROUP OF CYPRIPEIDIUMS.

THE four species—*C. niveum*, *C. bellatulum*, *C. concolor* and *C. Godefroyae*, form a very distinct and beautiful section of the genus *Cypripedium*, and their cultivation presents just that spice of difficulty which is so fascinating to the ardent grower.

*C. concolor*, introduced in 1865, was the first of the group to reach this country, and this species played a part in the early history of Orchid hybridisation, for *Cypripedium tessellatum* (*C. concolor* × *C. barbatum*) and *C. Marshallianum* (*C. venustum* × *C. concolor*) both flowered by Messrs. James Veitch and Sons in 1875, were amongst the first hybrid *Cypripediums* raised by Seden.

Several variations of *C. concolor* have occurred, notably *C. c. chlorophyllum*, with leaves devoid of the typical marbling; *C. c. Regneiri*, the flowers of which were yellow with a purple blotch on the sepals; and *C. c. sulphurinum*, which was possibly an albino variety, for the flowers are described as sulphur with two deep yellow blotches. It is, however, very probable that the only forms now in cultivation are the typical *C. concolor* and *C. c. Sanderae*.

*C. niveum*, first imported by Messrs. Veitch in 1868, has shown singularly little variation, but improvements on the type in size and substance have appeared from time to time. A meritorious variety appeared amongst a batch of imported plants in the Bradford nursery of Messrs. Charlesworth and Co. about 1907, and it is very probable that this variety was the progenitor of many of the best forms in cultivation to-day. The plant was purchased by a small trade grower, and divided, various varietal names being given to divisions by subsequent purchasers. One portion received an award under the name of *C. niveum* variety Goliath, when exhibited at Manchester by the late G. S. Ball, Esq. A small plant came into my hands when I was in charge of the Scampston Hall collection. I self-fertilised the flowers and raised a goodly batch of seedlings. These flowered very true to the parental form, in fact, their uniformity was remarkable. When the Scampston collection was dispersed in 1919, some of these plants passed into the hands of Messrs. Mansell and Hatcher and were exhibited by them at the Chelsea Show of that year.

Although first discovered in 1876, *Cypripedium Godefroyae* does not appear to have flowered in this country until 1885. Its claim to specific rank was at one time much questioned by some authorities, who considered it to be a natural hybrid between *C. niveum* and *C. bellatulum*; indeed, it is recorded as such by Nicholson, but time has proved this to be erroneous, and its claim to be a distinct species is now fully accepted. I have made the cross between *C. niveum* and *C. bellatulum* several times, but I have never flowered a seedling which could in any way be confused with the typical *C. Godefroyae* or its variety *leucochilum*.

It is, however, a very variable species, and many fine and distinct varieties have been flowered, as is proved by the fact that although only two awards have been given to *C. niveum* by the Royal Horticultural Society, they have honoured no fewer than eleven varieties of *C. Godefroyae* with awards. One of the best, *C. Godefroyae leucochilum Hodgkinsonii* was exhibited by Messrs. Sander at the Holland Park Show of 1906, and deservedly received the premier award. It would be interesting to know if this variety is still in cultivation.

The same firm imported a very fine type of *C. Godefroyae* in 1922. One of the plants, *C. Godefroyae splendens*, received an Award of Merit, but many fine varieties which flowered from this importation were fully equal to those which gained awards in earlier days.

*Cypripedium bellatulum*, perhaps the best known, and certainly the strongest grower of the group, was the latest comer, for it was not introduced until 1888. Of the many varieties of this species, the most noteworthy are *C. bellatulum album*, which was discovered by Mr. R. Moore, Assistant Commissioner of the Shan States. It first flowered in this

country in 1895 and received a First Class Certificate from the Royal Horticultural Society. Perhaps the richest-coloured form which has yet been flowered, *C. bellatulum*, Exhibits variety, also received a First Class Certificate when exhibited by the late J. Foster Alcock, Esq., in 1908. Happily, these two fine varieties are still in cultivation, and at Bodnant we have raised seedlings from each by self-fertilising the flowers.

A number of good hybrids have been raised between the members of the *niveum* group, and the green-leaved species, but, strangely enough, these have rarely been bred beyond the primary stage. It is too much to expect that species having such diverse characteristics can be blended to produce a perfect result in one generation, but the wonderful result obtained by Mr. G. F. Moore, of Chardwar, in the development of the large-flowered *Cypripediums* proves what may be achieved by careful and systematic line-breeding over a number of generations. Some people may consider the highest development has almost been reached by the magnificent Chardwar hybrids, but their perfection shows what a wide field is still open to hybridists in the evolution of hybrids with the *niveum* section on similar lines.

The few second-generation hybrids which have been flowered are a good augury of what may be expected from selective breeding. They include such fine hybrids as *C. Fred. K. Sander* (*Annie Measures* (*bellatulum* × *Dayanum*) × *bellatulum*); *C. Frenchay* (*Antigone* (*Lawrenceanum* × *niveum*) × *Lawrebel*); *C. Lady Leon* (*Dowleri* (*insigne* × *Godefroyae*) × *Honorae* (*Druryi* × *Godefroyae*); *C. Tom Worsley* (*Helen II* (*insigne* × *bellatulum*) × *Acteus*) and *C. Cupid* (*insigne* × *Venus* crossed with *insigne* × *niveum*). It is interesting to note that in each case one of the parents has been used in both generations. Several of these hybrids have obtained awards, whilst the only third-generation hybrid which I can call to mind, *C. Albion* (*Astarte* (*insigne* *Sanderae* × *Psyche* (*niveum* × *bellatulum*), × *niveum*, received a First Class Certificate when exhibited from Bodnant in October 1923.

The two best hybrids within the *niveum* group are probably *C. Virgo* (*Psyche* × *Godefroyae*) and *C. Blanchette* (*Psyche* × *niveum*). These again are second-generation hybrids, and were raised in the Scampston collection, but the seedlings were subsequently acquired, by Clive Cookson, Esq., who flowered and recorded both hybrids.

Of the primary hybrids, it is rather strange that although *C. concolor* and *C. bellatulum* have gained awards, the better and more popular hybrid, *C. Psyche* (*niveum* × *bellatulum*) has never been honoured by the Royal Horticultural Society; in fact, no combination of *C. niveum* with either of its allies has received an award.

It is well-known that in their native habitat members of the *niveum*—*bellatulum* group of *Cypripediums* grow on limestone cliffs, and growers early recognised that lime in some form was very necessary for the successful cultivation of these plants. Limestone, chalk and mortar have each been used, but so far as the latter is concerned, I am doubtful whether any form of burnt lime supplies all the essential elements, in their most readily available form, to truly calciphilous plants. I must confess that I am not sufficiently versed in chemistry to explain the point, but the fact remains that so far as this section of *Cypripediums* is concerned, the most consistent success has been obtained by using calcium carbonate in its more natural forms.

The late Sir Charles Strickland, of Hildenley, Malton, Yorks, was one of the most successful of the older growers, and he was fortunate in having a limestone quarry on his estate. Overlying the limestone was a layer of calciferous loam, and this, combined with finely broken corks, Sir Charles used as a potting medium for his lime-loving *Cypripediums*. Being a near neighbour, I was able to obtain a supply of the soil for use in the Scampston Hall collection, and by its aid all the *niveum* group of *Cypripediums* flourished amazingly.

When I came to Bodnant, I found that the Little Orme at Llandudno was the most convenient place from which to obtain a supply of calcareous loam, and this proved to be much richer in carbonate of lime than that which I had used in Yorkshire, the analysis being Ca. CO<sub>3</sub> 39.44 per cent, whereas that of the Hildenley loam was only 6.68 per cent. This enabled me to use a more fibrous compost, and yet retain the same percentage of lime carbonate which proved so beneficial to the plants that I have gradually replaced the calcareous loam which contains no fibre with good fibrous loam and added carbonate of lime in a finely ground state. This system has proved so successful that I can recommend it to other growers. I now use our usual *Cypripedium* compost (minus *Sphagnum* moss) with about four per cent. of lime carbonate added. The best form of this that I know is the Buxton Lime Firms Co.'s No 1 grade of ground limestone, the analysis of which shows Ca. CO<sub>3</sub> 98.35 per cent. This is readily soluble, and as a freely-drained compost is essential for the health of the plants, there is a possibility of the calcium carbonate becoming exhausted after the plants have been potted for a length of time; in such cases a little more may be sprinkled on the surface of the soil.

Lime in any form will kill *Sphagnum*-moss, and for members of the *niveum* group of *Cypripediums* this is better omitted from the compost. F. C. Puddle, Bodnant Gardens, Tal-y-Cafn, North Wales.

## INDOOR PLANTS.

## BERTOLONIAS.

(See Supplementary Illustration.)

BERTOLONIAS belong to the Natural Order Melastomaceae, and are grown for their beautiful foliage, but in common with many other choice stove plants, very few of them are in cultivation at the present day. There are about six species, all natives of South America, and probably the only ones in cultivation at present are *B. pubescens*, which has bright, light green leaves, with a broad, chocolate-coloured band down the centre; *B. maculata* with dark green leaves and white lines on the veins; *B. hirsuta*, which has dark olive-green leaves with a red under-surface, and *B. marmorata* (syn. *Eriocnema marmorata*), the leaves of which are purple underneath, and bright green above, beautifully marked with irregular streaks of white.

*B. Sanderae* is a seedling from *B. marmorata* and from the decorative standpoint is much superior to the type, the upper leaf surface being largely light green and white. The seedlings or hybrids, which are mostly of continental origin, are generally more showy than that of the species, and also more difficult to cultivate, owing, doubtless to the lack of green colouring matter in the leaves, which are usually beautifully marked with red and white.

The Supplementary illustration presented with the present issue is of the fine hybrid Madame A. Bleu. Other beautiful varieties that were formerly in cultivation are Comte de Kerchove, Kerchoveana, Madame E. Pynaert, Madame Leon Gay, Souvenir de Gand and Van Houttei.

Bertolonias, with the exception of some of the choice hybrids, are easily propagated by means of shoot cuttings inserted during the spring; they may also be increased by means of leaf-cuttings. They require a temperature of about 65°, and are best rooted in a bed of fibre and sand.

The plants should be grown in a compost consisting of equal parts light loam, fibrous peat and sand, with some pieces of charcoal added. The larger-leaved varieties are best grown singly in small pots, while the smaller leaved species and varieties are well-suited to growing in small pans.

The essentials for the successful cultivation of Bertolonias are a high temperature, shade and a close, moist atmosphere. If they can be given these conditions in a small house they may be grown on an open bench; in larger and more airy structures they should be grown under bell-glasses or hand-lights. J. C.

## FLOWER GARDEN.

## STOCKS.

EAST Lothian and other Stocks raised from seeds sown last autumn should now be planted out in their flowering quarters. If sown early, the plants should now be sufficiently advanced for the double-flowered specimens to be selected.

Lothian Stocks sown early in the New Year are useful for succession, and should now be hardened off ready for planting out when beds and borders are ready for them. The so-called Beauty Stocks, of which there are now many fine varieties, may be treated similarly; these, however, come on much quicker and may be treated in much the same way as the Ten-week varieties. Plants from a sowing made during February are now ready for planting out, while another sowing made at this time will provide plants for a succession.

All Stocks, unless they are grown in pots, should be planted out in their flowering quarters when they are quite small, for they transplant badly and take a long time to recover when they have attained any considerable size and been starved in boxes.

Stocks, in common with many other half-hardy annuals, are often sown too early, and in consequence suffer before their summer quarters are ready for them. The Beauty Stocks are very useful for supplying cut flowers, their long flower-spikes lending themselves well to decorative purposes. J. C.

## TREES AND SHRUBS.

## FORSYTHIAS.

BECAUSE of their hardiness, freedom of growth, profuse flowering, and their adaptability to almost any position in the garden, the Forsythias are splendid shrubs for town gardens. Their season of flowering is February and March, the opening of the flower-buds preceding those of the foliage, and giving the plants an intensely striking effect after the dull days of winter.

*F. suspensa* is most commonly grown; a fully developed plant of this species attains a height of twelve feet, producing loosely hanging branchlets, which, when flowering, support a profusion of daintily suspended, golden, bell-like blossoms, the whole plant presenting an attractive picture of considerable beauty. The flowering shoots, if removed just as the buds are expanding, are admirably adapted to placing in vases for the embellishment of dwelling rooms, and plants, after suitable preparation, are useful for forcing in readiness for the early decoration of the greenhouse. The species is frequently used for covering a wall or fence and is very bold and conspicuous when a group is established in a large bed. For this purpose an enhanced display is obtained by severe pruning done immediately the flowers are over, the resultant young shoots producing a wealth of blossoms the following spring.

*F. viridissima* is free-flowering, but of stiffer and more compact habit than the foregoing, and not so tall. It is a suitable plant for the front of a shrubbery or as an occasional subject for a spring display in the herbaceous border.

*F. intermedia* is an excellent grower, forming a shapely plant, the long, tapering shoots producing a veritable shower of yellow blossoms. This species should be included in all planting schemes, as it is much admired for its generous and lasting display during the early weeks of spring.

Other kinds of more recent introduction and worthy of note are *F. spectabilis* and *F. europaea*.

Pruning, generally, consists in the removal of weakened shoots and the shortening of the more vigorous ones, in all cases, directly the period of flowering has passed.

All the Forsythias root readily from cuttings of soft wood, and may also be successfully rooted in a sheltered place in the open ground during the autumn. A stock of *F. suspensa* may be obtained easily from shoots rooted and growing about the base of large plants. H. G. King.

## ALPINE GARDEN.

## SOLDANELLA ALPINA.

A SMALL plant of the Primula Order, known by the common name of Moon-wort, *Soldanella alpina* is well-known to visitors to the snow line of the Alps. This delightful little subject is seldom seen, probably because of a lack of knowledge of its requirements. Many catalogues of the past have stated that it is a difficult subject to cultivate, but whether this is correct or not I cannot state, although I am inclined to believe many who attempt its cultivation are too hasty, and expect too much from the plant in too short a time. We have had the specimen illustrated (Fig. 123) in our possession for fifteen years; it was collected by my employer.

In its natural habitat, the flowers of *S. alpina* appear among the melting snow. They are pale bluish in colour, with delicate, fringed, bell-shaped flowers, always nodding, and before opening they look like small tassels. The flower

and leaves with a pointed stick. In December and January the leaves will push up and unfold rapidly; at the same time the small flower spikes appear in the form of miniature loops, that is, the flower buds are bent towards the soil. In February they straighten up and the flower bells hang gracefully.

*S. alpina* does not require shade from October until it comes into flower, when shading is essential again. An extraordinary amount of water is needed through the summer by such a small plant. Last year we should have flowered this gem quite as well as this year, but, unfortunately, a few tiny black slugs cleared all except four of the spikes—a warning that slugs must be searched for during December nights. Mark Mills.

## ARNEBIA ECHIOIDES.

This plant rarely fails to attract a good deal of attention owing to the brownish-purple spots in the sinuses between the lobes of the corolla, gradually disappearing after the flowers

FIG. 123.—SOLDANELLA ALPINA.

stems are six inches tall when well developed, and usually carry three flowers; those only two inches tall carry one flower. Each leaf is at first curled up and of a purplish hue before unfolding; when fully expanded it measures half-an-inch across. The leaves are fully developed before the flowers open, forming a deep rich green carpet for the graceful little bells.

The plant illustrated has carried forty-three flower spikes and well over eighty flowers, in an eight-inch pan. The pan is well drained and the soil used in potting consisted of leaf-mould, sand, loam, and peat, the same sort of compost one would make up for *Primula sinensis*; the outdoor treatment through the summer consists in standing the pan in the shade, where it is free from drip from trees or shrubs; this is important. Particular care must be taken that neither moss, nor Liver-wort, grows among the small tufts. The plant is removed to a cold house at the end of September, and at that time we top-dress it with some very finely sifted soil, carefully working this among the crowns

have opened, otherwise, the flowers are of clear and pale yellow colour.

The large spikes are terminal and produced in early summer.

The leaves are sessile and alternate; the margins as well as the stems are ciliated. The height of the plants is about one foot, and it is not at all fastidious as to soil. It is a good subject for the rock garden. Cuttings made with a heel and inserted in late summer offer a ready means of increase, or the plant may be increased easily by root cuttings. It is a native of Armenia. Ralph E. Arnold.

## HEPATICAS.

THE various forms of *Anemone Hepatica* are very effective just now, in blue, white and rose, single and double flowers. *Anemone (Hepatica) angulosa* and its varieties have the larger flowers and foliage, and are the most effective; when established they produce an abundance of bloom from March to May. They grow freely in copes or half-shady positions in sandy leaf-mould. L.

## EDITORIAL NOTICES.

**ADVERTISEMENTS** should be sent to the PUBLISHER, 5, Tavistock Street, Covent Garden, W.C. 2.

**Letters of Recommendation** as well as specimens of plants for naming, should be addressed to the EDITORS, 5, Tavistock Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

**Editors and Publisher.**—Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the PUBLISHER, and that all communications intended for publication or referring to the literary department, and all plants to be named should be directed to the EDITORS. The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.

**Local News.**—Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers.

**Illustrations.**—The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.

**Newspapers.**—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see.

**Urgent Communications.**—If sent by telegraph, these should be addressed "Gard. Chron.," Rand; or by telephone, to Gerrard, 1543.

(Concluded from p. 231.)

## SILVER FIR.

THERE can hardly be two opinions at the present time as to which is the most vigorous Silver Fir for the British Isles, at any rate, for the western side. This is *Abies grandis* of Pacific North America. It is superior in several respects to the European species (*Abies pectinata*). It is a much more rapid grower in its early years. It is never injured by late spring frosts, as its buds do not burst until all such danger is over. The European Silver Fir is, on the contrary, so early in this respect, and its young growths so sensitive, that it is difficult to establish unless screened from frost by a canopy afforded by some light-foliaged tree, such as the Larch or Birch. *Abies grandis* is a healthier tree, not being subject to attack by the insect pest, Chermes, the bane of the European Silver Fir in this country at the present time.

*Abies grandis* puts on both height and growth quickly. A tree the writer planted twenty years ago is now about fifty feet high, with a girth at breast height of forty-five inches. Through possessing larger and broader needles, it may be considered a handsomer tree than the ordinary Silver Fir. It has not, however, the storm-resistance of the latter, consequently, to see it at its best, it requires a sheltered place, otherwise, when it towers aloft a gale may remove the top. The quality of its timber may be expected to be low, but the genus generally is not noted for high-grade wood. If a Coniferous tree is required which will give little trouble and go straight ahead, then *Abies grandis* may be recommended. It is quite accommodating as to soil provided there is plenty of moisture, and at the same time good drainage. Dallimore and Jackson, in their recent *Handbook of Coniferae*, state that "it is one of the least tolerant of shade among the Firs." I have not found it impatient in this way, and would, if unacquainted with this statement, have referred to it as a good shade bearer.

## DOUGLAS FIR.

There is no European representative of the genus, *Pseudotsuga*. A few species are now known from the Far East of Asia; but the Pacific side of North America, the great Coniferous region of the world for size and variety, is the chief home of the genus. Here, the Douglas Fir (*Pseudotsuga Douglasii*) occurs in great abundance and is the most valued timber tree of this region. It is only equalled or surpassed in height by the *Sequoias*. A few distinct forms (species, in fact) of the American Douglas Fir are now recognised, but the Oregon or green form is the only one suitable for affores-

tation in these islands. The Colorado or Blue species is more adapted for a continental climate.

It is natural that such a valuable timber tree should have been tried extensively in this country. We have had now nearly a century's experience of it, if not sylviculturally, at least arboriculturally: It has proved itself the fastest grower of any Conifer, though possibly *Abies grandis* may run it closely. From seeds however, the Douglas Fir would win, as *grandis*, like species of *Abies* generally, requires a longer sojourn in the nursery before it is fit for permanent quarters.

Of all the newer Coniferae, most faith has been and is being placed in the Douglas Fir. Given a fairly fertile soil, free from lime, and an adequate rainfall, the tree will produce a large quantity of timber in a comparatively short time, and provided its wood is acceptable, should be the most remunerative tree to plant for supplying mines with timber.

It is not a tree to dot about, but requires to be planted in large areas for mutual protection, as it has no wind-resisting quality. It is difficult to keep on its feet in its youth, and in later years, when root-firm, if much exposed, a gale readily snaps off its top. The difference in the resistance to wind shown by young Douglas Firs and Sitka Spruces has recently been vividly brought before my eyes as the result of the severe storm which visited us on January 28. In a six-year-old plantation stocked with Sitka Spruce to windward and Douglas Fir to leeward, not a Spruce was blown out of the vertical, while a fifth of the Douglas Firs required staking. A small patch of *Abies grandis* and some ordinary Spruce of the same age stood firm. The trees in this plantation were originally spaced four feet by four feet, though there are a good many gaps, as a late frost took toll the first spring after planting. The general opinion, I believe, is that Douglas Fir requires spacing at least six feet by six feet to give steadiness in early years.

The Douglas Fir, if not windswept, makes a very graceful, umbrageous and imposing tree. It casts a dense shade and is to Conifers what the Beech is to broad-leaved trees. Neither will suffer any rival. Just as the Beech will suppress any other hardwood, so will Douglas Fir any other Conifer. They both make ideal trees for underplanting. The Beech probably can endure greater shade, but in a contest it would be suppressed by the more quickly-growing Douglas Fir. From the standpoint of soil improvement, a mixed plantation of Beech and Douglas Fir might be made by giving the former a few years' start, and then adding the latter.

To the forester, the resistance to decay of the dead side-branches of the Douglas Fir is drawback. In order to produce clean timber the removal of the laterals as they die off is almost a necessity. Among Conifers it stands in this respect at one extreme and the Larch at the other. The fine, aromatic fragrance emitted by the Douglas Fir makes working among the trees a delight. The Colorado species, on the other hand, has a rather disagreeable odour. The timber of the Douglas Fir is superior in durability to that of Pines, Spruces and Silver Firs, but less durable than that of Larch. Fencing posts made from British-grown trees are said to last in the ground about half as long as Larch.

## OTHER SPECIES.

Among the newer Coniferae there are besides the above others which at present, from the forester's aspect, may be considered to be in the second class, though the future may possibly raise one or more to first rank. They belong chiefly to the Cypress-build of tree. Of these the most easily raised and grown is the Giant Arbor-vitae (*Thuja plicata*). If its wood, at the pole stage, had for fencing purposes some of the durability of the Larch, the tree would indeed be a boon; but I gather this is not so. The Lawson Cypress (*Cupressus Lawsoniana*), in its manifold varieties so conspicuous in gardens and pleasure grounds, is worthy of more attention in plantations. It is a quick grower a good wind-resister and a yielder of durable timber of fine quality.

The Nootka or Yellow Cypress (*Cupressus nootkatensis*), apt to be confused with Lawson's Cypress, though quite distinct, is the hardiest of the genus, producing excellent timber and thriving on poor soils. It is somewhat troublesome to raise, as its seeds, unless sown so soon as ripe, are slow to germinate. Then there is the Monterey Cypress (*Cupressus macrocarpa*), harder than might be expected, considering its native habitat. It is easy to raise and is the quickest grower of the genus. It is not particular as to soil, but care has to be exercised in transplanting, otherwise many deaths may ensue. It is worthy of attention as a useful and ornamental tree for the milder parts of the British Isles. No difficulty has been experienced in growing the tree here, but it is not easy to keep upright in its early years, as the growth of its shoot-system outbalances that of its roots. The timber has durability, and so may prove valuable for fencing.

Leaving the Cyresses, a word of praise might be said for the Western Hemlock Spruce (*Tsuga Albertiana*), a beautiful tree of a different habit to any of the foregoing. It is a good grower, preferring a moist loam, but is not particular in this respect, provided the rainfall is ample.

All the above trees which I have ventured to designate as second-class from the forester's standpoint are native of Pacific North America, Three Silver Firs from the same region might be added: *Abies nobilis*, a fine, dark glaucous-green Fir, is certainly worth trying. It provides probably the best timber of the genus. In parts of Scotland it is apparently quite a success, but elsewhere it is liable to attack by Chermes. *Abies Lowiana* and *A. concolor*, closely allied and often confused, are distinctive in their light glaucous foliage, thus contrasting with the dark hue of *A. nobilis*. They are both good growers and little subject to insect pests. Of the two *A. Lowiana* is likely to make the bigger tree and so be favoured by the forester. John Parkin.

## A REVISION OF VIOLAS.

(Continued from p. 213.)

**VIOLA BECKWITHII, TORR. and GRAY.**—The description of the leaves as "bold, broad, heart-shaped violet-foliage" is misleading. The leaves are broadly ovate in general contour, but they are cut into many segments, being doubly tripartite, and the segments are long and narrow.

**V. Bertolonii.**—This, in any case, should be *Bertolonii*. It is given as synonymous with *V. cenisia*. The origin of this confusion which has been repeated in several English catalogues, I have been unable to trace. *V. Bertolonii*, De Salis, is a distinct species, belonging to the *calcarata* group, and has not the remotest resemblance to *V. cenisia*. One nursery supplied me with the true *V. Bertolonii* with a query as to its name; another sent me the true *V. cenisia* under the name of *V. Bertolonii*. *V. Bertolonii* is endemic to Corsica and Sardinia. The flowers are reddish-violet, round in shape, carried on long stems, with a markedly long spur. The lower leaves are small, nearly round and slightly crenate; the upper ones oblong entire and gradually attenuated into the leaf-stem. The stipules have only one or two lateral segments which sometimes are quite rudimentary.

**V. blanda, Willdenow.**—This species, as Farrer indicates, has often been confused with *V. pallens*, (Banks) Brainerd. The difference is largely one of geographical distribution. The latter frequents the more northerly districts—Labrador, Newfoundland, Quebec, Alberta—though it also goes southward to the Colorado Mountains, but always at considerably higher altitudes than *V. blanda*. *V. blanda* is a more southern species, commencing only in Quebec and extending to Georgia, and confining itself rather to the eastern half of the American Continent. In consequence, *V. pallens* is much more hardy than *V. blanda*. The former also is a denizen of bogs, while the latter frequents woodlands rich in humus. There are certain

Supplement to The GARDENERS' CHRONICLE

BERTOLONIA MME. A. BLEU

marks by which the two species may be easily distinguished: the leaf-blade of *V. pallens* is quite glabrous, while *V. blanda* shows scattered hairs on the upper surface; the former lacks the pink tinge of *blanda*'s flower stem, leaf stem and leaf midrib, and the seeds of the former are almost black, while those of *V. blanda* are brown. It is, of course, necessary in exercising the last criterion to be certain that the seeds are ripe. The differences between the two species are propounded at this length for the reason that seed of *V. pallens* is being offered as *V. blanda*, while the true *V. blanda* is obtainable in England.

*V. bosniaca*, Formanek, is now to be known as *V. elegantula*, Schott—the name now adopted by most Continental catalogues, but strangely fought shy of in this country. The *Kew Hand List* even gives *V. bosniaca* as a synonym of *V. declinata*, Waldstein and Kitaibel, though the latter is now placed among the *lutea* *Violas* and the former among the *gracilis* group. Farrer gives the species an emphatic testimonial for ease of culture as well as beauty; but ease is not the universal experience, and I notice that in some quarters the advice is given to treat the plant as biennial, while in one catalogue it is simply stated to be annual. Mr. A. T. Johnston, in his book *In a Welsh Garden*, states that *V. bosniaca* disdains him, whether tried in border, ledges of rock garden, sun and shade, as well as moraine. Mr. Bowles confessed to the same lack of success until he tried it in the "fish hatchery or filter beds," since when, he writes, "I weed it up as well as supplying all who come." The "fish hatchery" is, I think, a version of the sand moraine; and in view of the somewhat arid mountain slopes in Dalmatia and Albania from which *V. elegantula* comes, a light soil with quick drainage, in sun, would appear to be a likely recipe. From what I have observed, however, this beautiful *Viola*, with its unique colour, would seem to grow lanky and small-flowered with age, so that it may not be fruitless advice to treat it as biennial. Some of the garden hybrids that are now appearing are extremely attractive, and preserve the colour of the type.

*V. Brittoniana*, Pollard, has often been confused with *V. septemloba*, Le Conte, and this confusion has been repeated by Farrer. The two species are not only geographically distinct, *V. Brittoniana* spreading from Virginia northward, and the other from southern Virginia southward; but they are also distinct in garden value, though both are beautiful species. The former is violet-purple, the latter pale purple; the former has the leaves cut palmately into numerous close segments, the latter pedately cut into segments which are separated one from another by a broad sinus, like the divisions of a bird's foot (as in the well-known *V. pedata*, the Bird's Foot Violet). The seeds of *V. septemloba* are much darker brown, and larger; the flowers, also, are larger, being sometimes two inches in diameter. It is found in nature in Pine woods, whereas *V. Brittoniana* (offered sometimes as *V. atlantica* in Continental catalogues) frequents moist, sandy or peaty places on the coast. *E. Enever Todd*.

(To be continued.)

ALL gardeners and nurserymen who take the naming of plants seriously owe a debt of gratitude to Colonel E. Enever Todd, for his interesting and valuable note: "A Revision of *Violas*," the first instalment of which appeared on p. 212.

I was particularly interested in what Colonel Todd wrote about *Viola arborescens*. I first became acquainted with this interesting plant from the beautiful illustration in Moggridge's *Flora of the Riviera*. Last April, when collecting in Majorca, I heard that the plant was to be found on the shores of Alcudia Bay. For some time I was unable to find it in spite of making several careful searches, but at the very last minute of my visit to Alcudia, I came upon it growing in very sandy soil on the fringes of light scrub in a thin open plantation of Aleppo Pine, close to the sea shore. It grew rather taller than is suggested by Moggridge's illustration, six to nine inches high, with wiry, woody stems, narrow, slightly-notched leaves, suggesting slender plants of *Pentstemon hetero-*

*phyllus*. It was not in flower and it was only by catching sight of a single seed capsule that I managed to discover the plant, so unlike was it to any *Viola* that I had ever seen. I collected a number of specimens and established them at Stevenage. Last season they behaved in a very odd way, producing throughout the summer a long succession of seed capsules, but never a single flower. By "flower" I mean the showy-petaled blossoms commonly known as such. What I suppose it was doing was to produce cleistogamous flowers, such as *Violas* often do produce, but though I examined the plants carefully at frequent intervals, I never could detect any semblance of anything that could be called a flower. However, seeds were collected and are now germinating.

## COLOUR CONTRAST.

EXPERIMENTS in colour contrast and combination at a trade flower show are drastically limited, if not entirely suppressed, by the bald necessity for exhibiting wares. Nevertheless, it is a mistake to put all one's goods in the shop window. The first requirement of a shop window is that it should be attractive; if customers can be lured to look in at the window, they will probably be lured to look in at the shop which lies behind the window. This sense of hidden treasure in reserve, arousing the curiosity of the buyer, is one of the greatest assets of successful salesmanship. Can it not be profitably applied to plants, as well as to other wares?

FIG. 124.—CARNATION MRS. A. J. COBB.

A glowing crimson, sweetly-scented variety, which won the "Daily Mail" Gold Cup at the British Carnation Society's Exhibition on March 29 and R.H.S. Award of Merit, April 5. Shown by Mr. A. F. Dutton. (see pp. 238 and 256).

I collected *V. arborescens* again this year, in February, in the same place. A friend who lives at Alcudia tells me that it does produce very pretty little flowers in the wild; in autumn or winter, I think he said. I fear the species will not be very hardy in this country. I planted it out in several positions, and in most cases it has died during the past winter at Stevenage, though in one or two cases it survived in the open without protection. It came through the winter quite happily in an unheated alpine house where the temperature fell many degrees below freezing on several occasions. The best chance, I think, would be to grow it in very sandy soil in a well-drained position and in full sun.

It will be interesting to see whether my seedling plants will produce the lovely flowers illustrated by Moggridge. *Clarence Elliott, Stevenage*.

It really comes to this: the nurseryman depends upon the effect of individual plants, instead of on their bulk effect. In his creed, a plant not exhibited is a plant non-existent. But the trend of modern gardening is towards mass effect—the popularity of the herbaceous border may be cited—and away from the botanical collection; so that it might be worth while to give the prospective buyer a few ideas on what can be done with colour and form, in conjunction and opposition, as opposed to mere variety indefinitely multiplied. Once drawn, he can easily be persuaded to accept a catalogue, which will further whet his appetite.

A pageant of all colours, superimposed and jumbled up, will, if the light is reflected from each, give a common denominator of greyness, and although it would be an exaggeration to say that the sum total of effect at a modern

flower show is as dull as that, still the fact remains that the innumerable colour encounters do give a kaleidoscopic effect, in which much of the sense of form is submerged. One has only to view it from a little distance to be sure that this is so.

It occurred to the writer recently to observe a few of the colour combines and colour collisions which were actually staged, though purely by accident, in a museum-like display of flowers, with a view to using the species as an effective draw, or planting them on the grand scale. Only plants which were staged actually in contact, and are of the same social standing—rock plants, shrubs, and so forth, are quoted.

One of the most spectacular encounters

FIG. 125.—CANE BRIDGE OVER THE NAM TAMAI, BELOW THE SEINGHKU CONFLUENCE.

was that between *Iris reticulata* and *Tulipa praestans*. The voluptuous violet falls of the first, tittered over with gold spangles, came up against the luminous scarlet of the second, and both seemed to leap out at one. By a curious circumstance the dainty *Iris bucharica*, with cream standards and bright gamboge falls, joined in the fray. Another *Iris reticulata* opponent was *Narcissus cyclamineus*, a glowing, chrome-yellow elfin flower like a Dog's Tooth Violet. Elsewhere the hot scarlet of *Anemone fulgens* encountered the lucid orange of *Narcissus bulbocodium* till the whole went up in a sheet of flame—or would have if it had not been smoked out by lesser things.

*Forsythia viridissima* and *Rhododendron praecox* react pleasantly, and so also do *F. spectabilis* and the dwarf crimson *Azalea Hinodegiri*; though the latter, not being a pure colour, there is not quite the same "zip" about the contest that there is with some of the others. Amongst rockwork, the soft powder blue of *Scilla sibirica* goes well with the moss-green and limpid yellow of *Saxifraga macedonica*, as does the sky-blue of *Omphalodes cappadocica*, with the rose-pink of *Azalea Hinemanyo*.

Another fine explosion was caused when a certain violet *Crocus* collided with a bright sunshine yellow *Tulip*, in which flickers of orange and red showed craftily; and yet again when our old friend *Iris reticulata* (which is a brand to fire many a discharge) met the strong gold of *Crocus susianus*.

But all these tiny explosions needed to be multiplied a hundredfold to be heard in the general uproar. F. K. W.

## MR. F. KINGDON WARD'S NINTH EXPEDITION IN ASIA.\*

### IX.—THE TEMPERATE RAIN FOREST.

A FEW more words on *Ilex nothofagacifolia*, which, by the way, is very distinct from *I. yunnanense*, with which it has been tentatively compared, or from *I. crenata*, another small-leaved species. There seems to be no other species which approaches the splayed-out, terraced habit, the thin, almost circular tiny membranous leaves, the almost sessile scarlet berries, and the queer, warty, corky stems of *I. nothofagacifolia*—the southern Beech suggested by the leaves is *Nothofagus Cunninghamii*. Perhaps the species which comes nearest to it is *I. intricata*, a Sikkim plant of quite different habit, and without the corky skin, but resembling it somewhat in foliage.

The Silver Barberry (K.W. 6,787) was one of the outstanding shrubs on the limestone ridge. These was some excuse for calling it a Holly on first sight, for the leaves are Holly-like, and there are no spines, and hence no need for short shoots bearing clusters of leaves, though the flowers are borne on terminal short shoots—but these I did not see when first I found the plant. The habit is that of a scrub plant sending up a number of erect, unbranched, divaricating stems, some three feet high. The dark green 'Holly' leaves, rather longer and narrower than those of *Ilex Aquifolium* are beautifully inlaid above with a network of jade-green veins; but the *clou* of the species is the under-leaf-surface which is of a glistening silver-white. There being no spines, the leaves are borne directly on the lacquered, red, long shoots, and it was not till the autumn when I again scaled that dreadful limestone ridge, through the barricade of tanglewood, and found the clusters of Pear-shaped, purple berries dangling from short shoots, that I saved my face

a length of 3 or 4 feet. Exposure does it no harm, and keeps it trimmed to decent proportions. I might mention here that this band of limestone ran right across the country in a narrow belt, culminating in peaks of 16,000 feet to 17,000 feet; it was completely surrounded by granites and schists. The limestone is a well-bedded crystalline rock, and apparently not magnesian.

Along the crest of the ridge, or rather, lining the sheltered face right to the summit, were dense thickets of *Rhododendron*, *Enkianthus*, *Lonicera*, *Deutzia*, *Berberis* and other shrubs, but chiefly *Rhododendron*. The species were, first, *R.*

FIG. 126.—OMPHALOGRAMMA SOULIEI AT 11,000 FT., IN JUNE.

aureum, and higher up, clumps of a very similar bush, almost impossible to distinguish in foliage, but with flowers of a lovely pale flesh tint, quite unusual in the genus. The long style is bright crimson, the calyx large and leafy as in *R. aureum*, the leaves closely lepidote,

FIG. 127.—CROSSING THE SEINGHKU RIVER.

by recording in my field book that the plant had the fruits of a Barberry. *B. insignis*, a Sikkim shrub, gives the clue. It also has Holly-like leaves, borne directly on the long shoots; but they lack the silver lining of the Silver Barberry.

Another good shrub found on the limestone ridge was a small-leaved *Cotoneaster*, of somewhat angular habit, with stiff, fan-shaped, branching stems. The flowers are pinkish, and so abundant as to bead every branch with long rows of scarlet berries. It is a plant for the top of the rock garden, requiring free scope to branch out in every direction, the stems reaching

with waxy papillae between the scales, giving a smoke-grey colour to the leaf. Altogether it is a beautiful and remarkable species, not so diffuse and floppy as *R. aureum*, but decidedly not of so hard and glittering a colour. I collected seeds under number K.W. 6,794, but there is probably some *aureum* mixed with it.

A little higher up, I came to bushes of a small-leaved 'Thomsoni' species, the flowers over (K.W. 7,612). In October a few flowers opened prematurely—pale rose with carmine spots, suggesting *R. Martinianum* as a possibly close relation. It had flowered atrociously in 1926, and it was as much as I could do to find half-a-dozen capsules; but by October it was crammed with buds, many of which were tentatively opening. The only big trees along the ridge were a *Juniperus* and a *Tsuga*, both

\* The previous articles on Mr. Kingdon Ward's Ninth Expedition in Asia were published in our issues of August 14, 28, October 9 and November 20, 1926, and January 1, February 19, March 5 and 19, 1927.

## KELWAY'S DELPHINIUMS

THE TOUCH OF SPRING is upon the garden—Now is the time to plant KELWAY'S LOVELY BLUE DELPHINIUMS. An ideal Hardy plant for every garden. Better varieties are supplied by Kelway's of Langport the Premier Raisers of many of the flowers for which the English garden is famous. It will pay you to have the best flowers in your garden. A good Delphinium costs more than an ordinary kind, but no more to grow, and it is immeasurably superior at flowering time.

They are at prices to suit every purse, for example:

Collection 'B,' good varieties to name, 21/- per doz., 150/- 100  
Collection 'D,' a wonderful selection, 40/- per doz., 300/- 100  
Collection 'F,' the cream of the varieties - 70/- per doz.

Carefully packed and sent free when remittance is enclosed with order for £3 and over; or a descriptive priced catalogue will be sent on demand.

Your friend is a gardener, a flower fancier. He will have nothing so fine to show you as one of the real Kelway Treasures in DELPHINIUMS. His visit to your garden, your own garden, will be a triumph for you.

## NETTINGS

### Garden Nets for Fruit Protection

Any length width, corded all round.

New, 1 in. sq. mesh, stout, 5d. per sq. yd.; New Medium, 1 in. sq. mesh, 4d.; New 1 in. Stout sq. mesh, 5d.; New, 1 in. Medium, sq. mesh, 4d.; Best, 1 in. Salmon Twine, sq. mesh, 7d.; Repaired, 1 in. sq. mesh, 3d.; Repaired, 1 in. sq. mesh, 3d. New Tennis Boundary Net—Repaired, 1 in. sq. mesh, 3d. Heavy hand braided, 7d. per sq. yd.; ting, roped around, Heavy hand braided, 7d. per sq. yd.; Medium, 6d.; Little lighter, 4d.; Selected repaired, 3d. Any length width supplied. Lawn Tennis Nets, regulation size, various qualities, steel and copper head lines, from 27/6 to 32/6 each. Diamond Nets, 1 in. superior quality, measured mesh, closed, 25 by 13 yds, 37/6; 50 by 18 yds, 75/-; 1 in., 25 by 2 yds., 3/6; or 4 yds., 7/-; or 8 yds., 14/-; heavy quality, about 14 mesh 25 by 2 yds., 4/5; 3 4 yds., 8/9; 8 yds., 17/6; New Pea Netting 5 in. mesh, 3 ft. 2 1/2 d.; 6 ft. 5d. yard. Goods carriage paid passenger train receipt order. Satisfaction guaranteed. Greenhouse Shadings, etc.

Samples and Full Particulars from the Manufacturers

Net Makers, PORTHLEVEN, CORNWALL.  
Estb. over Half Century.

rather ravaged by storms, but a haven of refuge for epiphytic shrubs, particularly the tiny-leaved *R. sino-vaccinioides*, and the yellow 'Edgworthii'. The former blooms at the end of July, or in August, and the tiny pinkish flowers, scarcely visible amongst the polished, Box-like leaves, are probably the smallest of the genus, and not particularly *Rhododendron*-like.

In October, ascending astride the ridge, a little higher up, I found in fruit the delicious *R. tephropeplum* and the 'Haematodes,' of which I shall have more to record later. In the undergrowth were species of *Vaccinium*, one with club-headed racemes of pink flowers like those of a *Pieris*, followed by grape-blue berries, being particularly attractive.

However, we will now return to the valley, where I presently found a new 'Vaccinioides' *Rhododendron* which has been named *R. asperulum*. It blooms a month later than the orange-flowered *R. insculptum*, another new series collected here, and more than a month earlier than *R. sino-vaccinioides*, and has pinkish, rather uninteresting flowers; indeed, the only one of these small-leaved epiphytes with any claims to beauty is *R. insculptum*. Botanically, however, the 'Vaccinioides' *Rhododendrons*, which are distinguished from all other species by their long-tailed seeds, are interesting. They are confined to the temperate rain-forests of the Indo-Malayan region, and are distributed somewhat as follows: *R. vaccinioides*, Sikkim, and eastwards to the Tsangpo Gorge, that being its first and only recorded occurrence outside Sikkim; *R. sino-vaccinioides*, *R. insculptum* and *R. asperulum*, Upper Burma; *R. emarginatum* and *R. euonymifolium*, south-eastern Yunnan. None of them is a plant with any horticultural future.

*R. dendricola* occurred scattered on the lower ridges at 6,000 feet to 7,000 feet, no longer epiphytic, but an erect shrub, some eight or ten feet high; and I collected seeds from this, the highest and hardest form; but it is not likely to prove hardy in Britain. Two other species of the 'Maddenii' series were found in the valley. One of these—K.W. 6,809—had rather small leaves, something like those of *R. Lindleyi*, and big capsules, but as I never saw it in bloom, I could make nothing of it. The second, K.W. 6,808, was also barren at the moment. But in September, I came across pools of yellow corollas drifting beneath giant trees, and finally traced them to this species, for the most part high up out of reach and invisible, but in one instance low down and accessible. And what a jolly shrublet it was, festooned with its little triplet trusses of bright, clear butter-golden flowers, smaller than those of *R. ciliicalyx*. The abundance of 'Maddenii' *Rhododendrons* in these forests will not have been overlooked. *R. Maddenii*, *R. megacalyx*, *R. sino-Nuttallii*, *R. dendricola*, and the two species just mentioned, a total of six, compared with only three (including again *R. megacalyx*, and *R. Maddenii*) on the other side of the divide. 'Maddenii' is essentially an Indo-Malayan group, but the species are not nearly so restricted in range as was formerly supposed. *R. megacalyx* in particular has had its range enormously extended recently. During the nine days, May 23-31, spent at my base camp, I had an opportunity to gauge the richness of the flora, collecting in the rain forest and in the open meadows. The variety of woody plants was astonishing, though there was not a great deal in flower yet. The dense thickets by the river, and the more open thickets in the meadow, contained species of *Buddleia*, *Rosa*, *Berberis*, *Viburnum*, *Euonymus*, *Clematis*, *Lonicera*, *Cotoneaster*, *Alnus*, etc. Orchids were fairly abundant, a large *Cymbidium* being in bloom, while in the summer the orange and black flowers of *Dendrobium fimbriatum* were often met with. In the meadows, in the Alder copse, and by the streams grew species of *Impatiens*, *Mimulus*, *Veronica*, *Cynoglossum*, and later in the year, *Swertia varius*, *Zingiberaceae*, an *Anemone*, and gigantic *Thistles*. The epiphytic flora was still abundant, and included besides the plants mentioned, several *Gesneraceae* (*Lysionotus* and *Aeschynanthus*), *Zingiberaceae*, *Melastomaceae*, *Agapetes*, *Vaccinium*, etc.

Meanwhile, I was both getting my stores and rations brought up from below, a few loads

at a time, and trying to engage coolies for the next stage of the journey. But as it was clear that no good purpose would be served by working from my base camp, I persuaded the Tibetan colony—with the lure of silver—to build me another hut at a point some miles up the valley, or where the stream divided, at an altitude of 11,000 feet. This was to be my advance base, and from that *piet à terre*, stocked with two months' supplies, I intended to do the bulk of my collecting. It was already apparent that there was no need to go outside the Seinghku valley; I could get as many good things as I should be able to collect there.

Drizzling showers now occurred every day, with occasional temporary bursts of sunshine, usually in the early morning. The day temperature often exceeded 70°, once it touched 75°, which was quite pleasantly warm without being oppressive. The minimum never fell so low as 50° at night, usually ranging between 53° and 55°. Curiously enough, when I returned here at the beginning of August, the maxima and minima temperatures were almost exactly the same as at the end of May, the heavy rainfall, and the heat, absorbed in melting the snow higher up, serving to keep the temperature down. Again, at the end of October, when the weather became finer, there was very little change of temperature, though the nights were somewhat colder. The following table shows what a very steady temperature was maintained.

Date.	Maximum.	Minimum.	Mean.
May	24 ... 69·5°	... 51·5°	... 60·5°
"	25 ... 64°	... 55·5°	... 59·5°
"	26 ... 71°	... 53°	... 62°
"	27 ... 70·5°	... 53°	... 61·5°
"	28 ... 73·5°	... 52·5°	... 63°
"	29 ... 75°	... 54°	... 64·5°
"	30 ... 67°	... 55°	... 61°
August	3 ... 70°	... 55·5°	... 62·5°
"	5 ... 69°	... 56°	... 62·5°
"	6 ... 74·5°	... 56°	... 65°
"	7 ... 77°	... 56°	... 66·5°
"	8 ... 73°	... 56·5°	... 65°
"	9 ... 70°	... 55°	... 62·5°
October	24 ... 70°	... 47°	... 58·5°
"	25 ... 69·5°	... 49°	... 59°
"	26 ... 67°	... 51°	... 59°
"	27 ... 68°	... 44°	... 56°
"	28 ... 70°	... 40·5°	... 55°

That is to say, during eighteen days on which both temperatures were recorded, in spring, summer and autumn, the greatest range of temperature was only between 77° and 40°—a range of 37°; and 50° would probably represent an extreme range at any time of year, the temperature perhaps never dropping below 30° or rising above 80°.

By June 1, I had secured ten coolies, and with a minimum of kit and food we started up the valley for our alpine camp, leaving the rest of the stuff at the base; more rations could be sent up in a few days, but it was getting late, and I was anxious to start work in the alpine region so soon as possible. So difficult was it to engage any coolies at all—I had to send messengers three days' journey to the Adung river for most of them—that it was essential when I moved, to go to a good place, since owing to the general inertia, I should probably have to stay there for a fortnight at least, before I could shift my camp again. F. Kingdon Ward.

## A FLOWER SHOW AT NICE.

THE flower show held at Nice on March 12 is perhaps worth recording, for although the quality of the flowers may not be any better, if so good, as our English-grown blooms, the arrangement in general effects are so much more artistic. The point on which I would insist is that there are so many fewer flowers shown, so those that are shown are far more beautiful, "like a picture," in effect.

To me who had not seen the displays of varieties of *Citrus* fruits shown by Mr. Hanbury, of La Mortola, at Vincent Square, the display of M. Dupeux was of especial interest and beauty. Surely in our haste for novelties of fleeting effect,

we lose the lasting beauty of this race of fruiting evergreen shrubs or trees! Certainly the colour effect was even more beautiful than the best scheme of spring annuals that needs replacing each season. Instead of endless potting and renewing of plants, is it not even truer gardening to syringe and prune and shelter these magnificent fruits of the earth which we are content to admire in a few special gardens?

The splendid vases of Carnations shown by Messrs. Bonfils attracted all eyes by their beauty and artistic arrangement, but these carefully disbudded specimens with stalks of several feet in length are, of course, grown under glass, and to me the more modest groups of Carnations grown in the open air and only sheltered by mats on cold nights were still more interesting. It is something to know that such a variety will withstand a little bad weather, or that another variety will flower in mid-winter, while another may fail to produce good flowers at that season in the open.

These Carnations were all shown in big earthenware jars, coloured brown, orange, green, or rather, pale lemon, so that each shade of colour in the Carnation had its foil in the jar. They were stood on the ground or raised on pillars above the verges of grass that edge the beds, as no staging was allowed, and with plenty of space between these jars—which often hold more than two hundred blooms—the value of the flowers was greatly enhanced. "Nocrowding" should be the motto at exhibitions.

The attempts at rock gardens were as inferior to English work as their arrangement of Carnations was superior. There was an un-rehearsed effect where a *Wistaria* trained up a Palm trunk (whose head was outside the big shed) had burst into flower, and with the forced Lilacs and Azaleas grouped round its foot gave a pleasant sensation of open-air gardening. Altogether, the show gave much pleasure to the writer. Edward H. Woodall.

## MESEMBRYANTHEMUM.

(Continued from p. 117.)

MUIRIA, N. E. Br.

**Muiria Hortenseae N. E. Br.**—In reference to the note at the end of my description of this very singular plant on p. 116, concerning the extraordinary ability of the large internal cells (idioblasts) when isolated and some placed on glass and some on a piece of paper to withstand the dry atmosphere of a living room without drying up, I now wish to record further, that these same cells, still upon the same pieces of glass and paper, remained under exactly the same conditions without any covering, fully exposed to the air and dust of the room for more than a week without drying up and apparently without shrinkage in volume, and were still glittering like dew-drops. The temperature of the room was about 60° to 62° Fahr. in the daytime, and about 50° Fahr. at night. On the tenth day a few cells showed signs of collapsing. On the twelfth and thirteenth days most of them were drying up, and on the fourteenth day only one cell, which was about one line in diameter, remained fully plump and glittering, all the others being partially or fully dried up. This one cell remained plump until the eighteenth day. An ordinary saucer half-filled with water was placed by the side of the cells on the second day after they were isolated, but the water had completely dried up two days before the cells were drying up. This seems to be such an extraordinary conservation of cell-contents and vitality under conditions that I believe would be fatal in a very short time to the cells of most plants, that I deem the fact worthy of record.

8A.—MENTOCALYX, N. E. Br.

Perennial, stemless. Rootstock fleshy, bearing two or more growths, each, under natural conditions, with only one pair of leaves, except when making a new pair. Leaves opposite, unequal, when young erect and pressed together so as to resemble an eagle's beak; adult leaves

spreading, large and thick, flat and deltoid in outline on the face, one of them compressed and deeply keeled at the apical part on the back, velvety-puberulous. Flowers solitary, terminal, pedicellate, without bracts. Calyx unequally 6-lobed down to the base of the ovary, and when in bud with the base of one of the two larger lobes more projecting than that of the other lobe so as to form a sort of chin to the bud.

spreading when expanded; expanding-keels with their basal part rising into a hump half as long as the valve, thin, parallel, minutely toothed at the edges, and their upper part ~~al~~inate to the valve and then forming broad, marginal wings; cells flatly roofed with membranous, flexible cell-wings, without a tubercle at the opening. Seeds many in a cell, ovoid, pointed at one end, smooth.

floral structure is entirely different. The manner in which the entirely superior ovary of the flower becomes half inferior when in fruit is very remarkable; I have not observed any other similar instance, either in this group of plants or in the many thousands of flowers I have dissected belonging to other orders. The somewhat chin-like base of one of the larger calyx-lobes is also unlike anything I have seen in any other member of this group of plants.

#### 1. *M. Muiri*, N. E. Br. (Fig. 128).—

Leaves unequal, spreading, the larger of the pair 2-2½ inches long, 14-21 lines broad at the base and narrowing from thence in a deltoid manner to a more or less acute apex, 9-12 lines thick at the base and 10-18 lines thick at the deeply-keeled apical part; the smaller leaf 1½-2 inches long and only 4-7 lines thick at the apical part, not so deeply keeled as its fellow, otherwise similar in shape; both are flat on the face, the larger one with a slight oblique twist (not represented in the figure), compressed and deeply keeled or dilated and more or less incurved-hooked (at least when young) at the apical part, the smaller leaf being neither hooked nor deeply keeled at the apex; when young, the two leaves are closed together, and then somewhat resemble the beak of an eagle in form; substance firmly fleshy; surface smooth and velvety to the touch, microscopically puberulous, dull green, but probably of a brownish or greyish tint under natural conditions, not dotted. Flower always produced in front of the new pair of leaves. Pedicel 1½-2 inches long, erect, slightly compressed and somewhat 2-edged, 3-3½ lines broad and 2½ lines thick at the upper part, slightly tapering downwards, velvety-puberulous, green. Calyx in bud and viewed from the side with a somewhat chin-like base in front, velvety-puberulous; lobes ascending-spreading, the two larger 9-13 lines long and 4½-5 lines broad at the base, narrowing to an acute apex, keeled down the back and more or less concave and hooked or incurved at the apex; the four smaller lobes 5-6½ lines long, ovate, obtuse, with membranous edges. Corolla 1½-2 inches in diameter, expanded in the day-time, more or less closed at night, and lasting 10-14 days, pleasantly fragrant; petals numerous, free, spreading, in about two series, rather lax, about 9 lines long and ½-line broad, linear, acute, pure white according to Dr. Muir, but in one of the living flowers seen the white was faintly tinted with pinkish-mauve, with a darker midline, and the other white without the pinkish tinge, so probably the colour varies, as it does in many species belonging to the other genera. Stamens somewhat loose, 2½-3½ lines long; filaments white; anthers milk-white. Glands of the disk blackish-green. Stigmas 6, spreading, about 1½-line long, stoutly subulate, acute, somewhat bristly-plumose, green. Ovary in the flower entirely superior, with a broad base, becoming partly inferior in fruit! Green, with 6 stout ribs, 6-celled. Capsule as described under the genus, half inferior, about 5 lines in diameter when closed and 7 lines in diameter when expanded; valves pallid within, with honey-coloured, expanding-keels; the cells, instead of being superior and entirely above the level of the base of the inner side of the calyx-lobes as they are in the ovary, are (in the capsule) inferior and entirely below the level of the inner surface of the base of the calyx-lobes, the valves alone being now above that level. Seeds less than ½-line long, ovoid, smooth, pallid, with a brown point.

Riversdale Division: In the Klein Karoo, among white stones, flowering in September and October, 1,200 feet above sea level, Muir 3,892!

Described from a living plant sent to me by Dr. J. Muir, this being another of the many interesting new species that he has discovered, which shows how rich South Africa must still be in interesting undiscovered plants.

I do not know how this plant behaves in South Africa, but from Dr. Muir's statements about it, I imagine that the flowers become fully developed from their first appearance in about two months. With me however, the process of their development has been exceedingly slow; I first saw signs of flower-buds

FIG. 128.—MENTOCALYX MUIRI, N. E. BR.

A, a flowering growth; B, a flower bud just ready to open; C, a flower; D, longitudinal section through a flower; E, longitudinal section through a ripe capsule; F, a seedling. All natural size except D, which is enlarged rather more than two diameters.

Corolla large, petals numerous, free. Stamens numerous, erect, somewhat loose; filaments not bearded. Glands 6, separate, large. Stigmas 6, stoutly subulate, somewhat bristly-plumose, acute. Ovary wholly superior and 6-ribbed when in flower, becoming half-inferior when in fruit, 6-celled; placentas on the floor of the cells; ovules numerous in each cell. Capsule half-superior, obconic, convex, and with 6 gaping sutural ridges on the top, and with 6 valves and cells; valves deltoid, reflexed-

The only known species and type of the genus is *M. Muiri*, N. E. Br., a native of the Klein Karoo, in South Africa.

The name is derived from the Latin, *mentum*, a chin, and *calyx*, a cup or calyx, because the calyx, when in bud, has a sort of chin to it.

The affinity of this fine and very distinct genus is not very evident, but as its vegetative characters more resemble in form those of the genus *Pleiospilos* than any other, I place it immediately before that genus, although its

at the end of August, 1926, but it was not until the fifth of March, 1927, that the first flower opened, being over six months in developing! Evidently this is the effect of the colder temperature of our climate, and I expect that the flower-buds appearing with the new pairs of leaves at the end of February, 1927, will develop into flowers before they are six months old, as the warmer season is now approaching (this is written on March 14, 1927). This plant appears to flower very freely, as fresh flowers are appearing on every new growth on my specimens.

My flowering plant of this species has only two growths upon it, each with one flower. The first flower was of a decided pinkish-mauve tinge and the second almost pure white. The first flower, however, expanded during very dull, sunless weather, while the second one had several days of bright sunshine upon it, so that it is possible that the change in the amount of light was the cause of the change in colour. My only other plant did not develop its flowers.

Fig. 128 represents at A, one of the two growths on the plant. B, a mature flower-bud nearly ready to open, showing the prominent chin-like base of one of the calyx-lobes. C, a flower as it appeared in dull weather; in bright sunshine the petals and shorter calyx-lobes are much more spreading, although the larger calyx-lobes remain in the position I have represented. D, a longitudinal section through the flower, showing its structure, enlarged slightly more than two diameters (all the other figures are of natural size). E, a longitudinal section through a ripe fruit showing that the ovary in ripening becomes half inferior! Probably this is due to the enormous shrinkage of the central watery tissue of the pedicel that takes place during the ripening. F, is a young seedling, showing the united cotyledons and the first pair of leaves, which are minutely puberulous. N. E. Brown.

(To be continued).

## FLORISTS' FLOWERS.

### CHRYSANTHEMUMS.

CUTTINGS inserted during January and February should be potted so soon as they are well-rooted. By the time these notes appear it will be quite safe, in all except the most exposed districts, to place all rooted plants in cold frames. Provided frost can be excluded, they will continue to make sturdy growth under cool treatment. If frost threatens, mat the frames early in the evenings.

The power of the sun is increasing every day, and careful attention must be paid to ventilating the frames. Newly-potted plants should be kept in fairly close conditions for a few days, and if the sun is very bright it will be advisable to shade the plants for a few hours at mid-day until they have recovered from the effects of removal.

Ventilating is an important cultural detail at this time of the year in the cultivation of these plants. The more fresh air they get the better, provided they are protected from frost and cold draughts. The frame should be in a position where the maximum amount of light is obtainable with the minimum of wind, especially from the east.

A little intelligent management of the lights will usually counteract the evils arising from cold winds. If the wind is in the east, tilt the lights on the west side, and *vice versa*. In the daytime the thermometer should be the guide as to how much ventilation is required. If it registers 40° to 45° ventilation will be necessary. If by reason of the sun's rays the mercury continues to rise after ventilation has been given, increase the amount of air. Overhead spraying has a beneficial effect on plants that have drooped while the ventilators have been open.

The more forward plants will, in many instances, now be ready for transferring to six-inch pots. They should be repotted before the roots form a mass at the bottom of the three-inch pots; plants that are allowed to become root-bound in small pots invariably suffer when transferred to larger receptacles.

A suitable compost for present use may be made of four parts fibrous loam, one part thoroughly rotted manure, one part leaf-mould, one part powdered mortar rubble, a half-part wood-ashes, and a six-inch potful of bone-meal to every barrow-load of the compost. The use of sand must be left to the judgment of the operator; if leaf-mould, wood ash, and lime rubbish are used as directed, little or no sand will be required. The loam, manure, and leaf-mould should be chopped, and not riddled.

Mix the compost thoroughly and stack it in a heap for a few days before using it. Before commencing to repot them carefully examine the plants to be dealt with, and pick out any that are approaching dryness at the root. These should be well watered, and stood aside to drain before being repotted. To attempt to repot a Chrysanthemum while it is dry at the roots is inviting failure.

At this potting, well-soaked, new pots should be used if they are available, or, if not, thoroughly clean, old ones. If dirty pots are used, the soil and, incidentally, the roots, will stick to the sides of the pot when the plant is turned out for the final potting. Use about an inch depth of drainage, and cover this with a little of the lumpy portions of the compost. The plants, when potted, should be slightly lower in the pots than they previously were. Ram the compost fairly firmly with a blunt potting stick, but take care not to damage the roots of the plants. Return them to the frames and try to prevent them from flagging for a few days. As intimated above, careful ventilation, overhead spraying, and possibly some shading will accomplish this end.

A rough and ready method of dealing with decorative varieties is to stop the plants at the time of repotting them. This is a great mistake, and has a weakening influence on the shoots which form in consequence of the stopping. Stopping should not be attempted for a few days prior to potting, nor for eight or ten days subsequently. James A. Paice.

## LILIES IN SCOTLAND IN 1926.

ON the whole, last season was a very satisfactory one in regard to Liliums, and one or two uncommon species flowered for the first time with me. These notes refer to a garden in East Lothian, where the Lilies will flower this summer for the last time as they will be transferred to fresh quarters in the Spey Valley, in Morayshire, in the autumn. I believe that climate and soil conditions will be more favourable to the cultivation of these Lilies in their new home, and from results already noted in that favoured county, I am convinced that many of the species will establish themselves satisfactorily.

In East Lothian, *L. regale* is the finest of the Lilies, chiefly because it has been established the longest. It was the first to be grown, and its success led to the introduction of other species. The bulbs I write of are now fourteen years old, and have been in their present quarters for ten years. During the latter period they have been disturbed only once. That was in the autumn of 1925, when the plants were lifted, separated and replanted the same day. Many of the bulbs were sixteen to seventeen inches in circumference, and my record number of flowers to a stem is thirty-three. The stems attain a height of about six feet, and fifteen flowers to a stem is quite common. Last year some of the clumps had a dozen stems. The Lily resents disturbance. In December, when I lifted some bulbs, I found they had roots like a rat's tail running deeply into the soil, and these roots appear to be active all through the winter.

My method of growing this Lily is to top-dress the bed with leaf-mould in spring so soon as the stems appear above the ground. When the stems appear through the mulch another dressing is applied and a little bone-meal is added to it. The total depth of the dressing is about six inches. The bed is dotted with Golden Yews, now about six feet in height, and is fronted with Rhododendrons. When the

stems have ripened up in autumn the mulch of leaf-mould—then a perfect network of stem roots—is removed; the surface of the bed is lightly forked over and dressed with kainit at the rate of about three ounces to the square yard, and the surface ground left fully exposed throughout the winter. I do not believe in mulching for winter protection; the bulbs must have open soil conditions to keep them in a healthy state. Mr. Coutts, of Kew, is a great believer in what he terms "root association" for Liliums, and I fully agree with him. Hence the Yews and Rhododendrons in the bed of *L. regale*. If this Lily can be planted so that it will not be disturbed for years, it establishes itself magnificently, and is, undoubtedly, one of the noblest of the species.

I planted *L. auratum* var. *Crimson Queen* in pots in 1925, but this gorgeously-coloured Lily flowered well in the open ground last year and was a great sight in late September. I think that I have managed to get it established as the bulbs planted were, fortunately, not too large to begin with. The flowers are as large as those of *L. auratum*; in the centre of each petal there is a band or streak of deep crimson, and, that colour flushes over the whole of the flower. It is a striking Lily and is, perhaps, the most grandly-coloured of all. Mr. Grove informed me that he thinks it is really *L. cruentum*, and that it was grown some years ago by Isaac Davies, of Ormskirk. It is a Lily worth persevering with.

My present stock of *L. centifolium* (Farrer's 716) consists of three-year-old bulbs raised from seeds. The stems all came blind last year, but they should be strong enough to flower this season. A seedling from this species crossed with *L. regale* flowered last year for the first time and produced three lovely trumpets. I prefer not to say more about this at present, but hope to have it photographed during the coming season. It appears to be a Lily with a grand constitution.

*L. Alexandrae* flowered here last season for the first time. It is a dwarf grower, but its white flowers were almost as large as those of *L. auratum*. It is a lovely Lily with a delicious fragrance, and appears to be well worthy of a place in the garden. It is said to be a white form of *L. japonicum* (Krameri), but Mr. Grove believes it to be a form of *L. longiflorum*. I think that is correct.

*L. japonicum*, ordinarily called *L. Krameri*, was practically hopeless to establish when imported bulbs were planted, but I raised a small batch from seeds, and some of these flowered last year. I was able to save a nice lot of seeds which I have sown this season. The colour of the flowers, a soft rose-pink, is unique amongst Lilies. *L. japonicum* has the reputation of being a difficult species to grow in the open, but the trouble has been caused by the lack of sound, healthy bulbs. Imported bulbs, in my experience, have always arrived shrivelled up and, in many cases, diseased. *L. japonicum* revels in a top-dressing, such as is applied to *L. regale*.

*L. rubellum* thrives amongst a colony of *Arundinaria* (*Bambusa*) *pygmaea*. This little Lily is somewhat of the colour of *L. japonicum*, but altogether lacks the dignity of that exquisite species. I wanted a dwarf plant to act as a covering for the roots of *L. rubellum* and I selected the little Bamboo. Its dwarf, spreading growth is just the thing for this Lily.

*L. Willmottiae*, raised from seeds, is a Turk's Cap that is assured of a great future. My plants, now five years old, give from ten to fifteen flowers on a stem. This species from Western Hupeh is also a stem-rooter, and a mulch is imperative. The roots must be screened and, as in the case of *L. rubellum*, I use *Arundinaria pygmaea* for the purpose very effectively.

*L. cernuum* is a dwarf Siberian Lily of Mar-tagon type and reminds one of *L. tenuifolium*. It flowered here last year. Its colour may be described as a deep rose; the stems are very slender, but quite strong enough to support the flowers. I hope to see this Lily in better form this season, as the bulbs I received were not over strong.

*L. pomponium*, the true form, flowered also for the first time here last year. The bulbs had been planted for three years but had not flowered previously. They were collected bulbs

and, I think, had been too long on the journey which accounted for their weakness. I have now, however, an abundance of home-saved seeds which have been sown and germinated very well. This Lily rivals the brilliant *L. chalcidonicum*, and it comes into flower very much earlier. *L. pomponium* requires no top-dressing and it appears to thrive best when planted shallowly, like *L. testaceum*.

I am growing a batch of *L. testaceum*, so that I can be assured of healthy bulbs for transference to the north in due course. All Lilies sent to Morayshire to be established there, with the single exception of *L. testaceum*, will have been raised from seeds. The garden there is free from disease, and no imported bulbs will ever enter its gates, unless they undergo a period of quarantine elsewhere. No risks will be run. It is for that reason that I have raised batches of *L. auratum*, its variety *platyphyllum*, *L. Willmottiae*, *L. pomponium*, *L. rubellum*, *L. monadelphum*, *L. regale*, *L. chalcidonicum*, *L. Parryi*, *L. Sargentiae*, and many others from seeds. Some of the seedlings of *L. auratum* flowered last year and there is a variation in colour. I found the form known as *L. auratum rubro-vittatum* amongst the seedlings. *L. auratum platyphyllum* will flower this year from seed, and it will be interesting to see if there is any variation from the type. I should like to come across a *rubro-vittatum* form of this grand Lily!

*L. philippinense formosanum* flowered in late September, and some blooms in evidence in October were destroyed by frost. These flowers were entirely out of season. The seeds were sown in the spring of 1925, and the seedlings were planted in their flowering quarters in July of that year. They made little growth that season, but last year they grew strongly and flowered as stated. I see that fine bulbs have been formed, and in many cases there is a tiny bulb at the foot of the old stems.

*L. Farreri* is one of the loveliest of the Turk's Cap Lilies, and has been well-named the Marble Martagon. The white flowers with their blue veins are extremely beautiful. The variety *Duchartrei* with its rosy coloured flowers is also pretty, but it lacks the charm of the superbly graceful *L. Farreri*. Both were raised from seeds and, so far, I have seen no variation.

*L. Sargentiae* comes into flower just after *L. regale*. Like the latter, it is grateful for a mulch of leaves. It forms abundance of bulbils at the axils of the leaves. *Azalea malvaeflora* is used as a shade for the roots. I am not very enthusiastic about this species; it seems to lack the refinement of *L. regale*, and when once *L. centifolium* is procurable in quantity I do not think that *L. Sargentiae* will be wanted.

Species due to flower this year from seeds are *L. Parryi*, *L. philadelphicum luteum*, *L. Martagon album*, *L. Martagon dalmaticum*, *L. Martagon Cattaniae*, *L. Davidii*, *L. Henryi*, *L. sutchuenense*, *L. roseum*, *L. medeoloides*, *L. myriophyllum*, *L. amabile*, *L. Roezlii rubrum*, *L. canadense*, *L. croceum*, *L. candidum*, *L. philippinense formosanum* × *regale*, *L. centifolium* × *Willmottiae*, *L. japonicum* × *Willmottiae*, *L. centifolium* and *L. Kelloggii*. *George M. Taylor, Edinburgh.*

## VEGETABLE GARDEN.

### ONIONS.

THE Onion is one of the most important crops of the vegetable garden, and for a supply for the various purposes, different methods are adopted. Onions have an advantage over many other vegetable crops in that they may be grown on the same ground for a number of years without detriment to the crop other than caused by pests and diseases. Once the soil has been brought to a high state of cultivation, it may easily be maintained in a suitable condition for this crop each successive season. Where Onion-fly is prevalent, change of site is advisable as one means of lessening the chances of attack. Sowing is divided into two main periods, spring and autumn.

The spring sowing should be done on the first favourable opportunity when the soil can be brought to a good tilth at the end of February

or early in March; the condition of the soil at the time of sowing is very important. Sow the seeds in drills made twelve to fifteen inches apart, taking care not to bury them deeply.

As the Onion-fly is such a serious menace to plants from this sowing, preventive measures should be undertaken in good time. Probably one of the best deterrents to the fly is a weekly dusting of soot, commencing about the end of April and continuing until the middle of June. This will greatly stimulate the growth of the plants and make the immediate surroundings very unpleasant for the fly. Commenced in good time and performed at regular intervals, this treatment should prove effective.

A very simple matter, but one of considerable importance, is that the rows should be kept free from weeds, especially when the Onion plants are small, as the removal of large weeds may cause the Onion seedlings to be uprooted, making access for the fly easy. Thinning will need to be done gradually in case the fly should prove troublesome; on the other hand, it must not be either delayed too long, or done in such a manner as to cause much soil disturbance. The thinnings, when allowed to develop to a fair size, will be useful for salads. A distance of four to eight inches between the plants, according to variety, and requirements, is usual.

Further treatment consists in keeping the crop clean in all respects, and excessive feeding must be guarded against or the keeping qualities of the bulbs will be impaired. The bulbs should be thoroughly ripened before being stored in a dry, airy structure, where a comparatively low temperature can be maintained.

There are numerous varieties in commerce and most growers have their special favourites. Ailsa Craig, Cranston's Excelsior and Premier, are all of a similar type, and are all popular with growers. Another good sort is Bedfordshire Champion. Others of a smaller, but excellent keeping type, are Australian Brown, Brown Globe and James' Long-Keeping. Where a flat Onion is preferred, Giant Zittau, Rousham Park Hero and White Spanish may be recommended. Southport Red Globe is one of the best of the red varieties.

Onions for pickling should be sown fairly thickly late in April, on ground that is not too rich and little or no thinning is necessary. Covent Garden Silver Skinned Pickling is a desirable variety.

Autumn sowing, where it is possible to adopt it, offers several advantages, these being (1) the Onion fly rarely, if ever, attacks plants from this sowing; (2) thorough ripening of the bulbs is more certain in late districts, or where the rainfall is unduly heavy; (3) the plants attain a usable size quicker than those sown in the spring, thereby filling the gap that naturally exists between the end of one season's crop and the ripening of the next; (4) larger bulbs are obtained by the longer season of growth than from those grown entirely in the open from a spring sowing; (5) an early supply from the open for salad purposes is procured.

As it is inadvisable to have ground too rich for this sowing, any soil in good heart that has just been cleared of a crop, such as Peas or Beans and has been dug to the full depth of the spade, will do quite well, bearing in mind that it has only to serve the purpose of a seed-bed during the winter.

Two important points to bear in mind are that the soil should not be too rich or the sowing made too early, or bolting will take place the following spring. The time of sowing necessarily depends on the soil and locality, but, generally, the last week in August or the first week in September is quite early enough for the south.

Sow in rows made twelve inches apart, in an open situation on well-drained land.

The plants should remain in the seed-bed until early March, when they can be planted in rows twelve inches to fifteen inches apart, allowing six to eight inches between the plants in the rows. To minimise the risk of bolting large seedlings should not be chosen for planting, those of medium vigour giving the best results. Deep planting should be guarded against. Should bolting occur, when the plant is developing a flower head, cut through the solid part of the junction of the stem and flower-head. Although plants treated in this manner do not give first-class bulbs they will be reasonably

good. Extra large plants from this sowing may be used either for salad or planted for use when only partially developed.

The choice of varieties for autumn sowing depends on the purpose for which they are intended. If intended to be grown to full maturity for storing, with a view to keeping as long as possible, those recommended for spring sowing are suitable. If the crop is to be used quickly when fully grown, the Lisbon, Rocca or Tripoli types are preferable. Two varieties of comparatively recent introduction which distinguished themselves in a large trial of autumn-sown Onions at Wisley during the years 1916-17, are Autumn Triumph and Foxfield, and these are excellent in all respects.

Where a portion of the crop is grown especially for salad purposes the seeds may be sown about mid-August and the young plants will benefit from a light dressing of some quick-acting fertiliser early in the year. The white varieties or any of the quick-growers are suitable for this purpose. Young Onions for salads may be raised in boxes under glass at any period of the year.

Different methods are employed for the production of extra large bulbs. For this purpose it is necessary to have a long season of growth and varieties which are capable of growing to a large size. The usual method is to sow seeds under glass in gentle warmth during January, giving the plants similar treatment to half-hardy annuals, and when thoroughly hardened plant them in the open early in April.

Varieties of the Ailsa Craig type are suitable for this purpose. Although the varieties mentioned are mostly old and well-known, it is interesting to note that the majority received some recognition in the various trials of this vegetable that have been conducted at Wisley during the past ten years.

In conclusion, I would emphasise the desirability of obtaining European-grown seed of good strains from seedsmen who may be relied on to supply varieties true to name. *J. Wilson, Wisley.*

## HOME CORRESPONDENCE.

[The Editors do not hold themselves responsible for the opinions expressed by correspondents.]

**Sunlight Rays in Glasshouses.**—Mr. Allen Falconer's remarks in *The Gardeners' Chronicle* on the above subject interested me greatly. For I, too, have had some experience of gardening under the inclement climatic conditions which prevail in the locality he refers to, and I can fully endorse his statements regarding the difficulty of raising sturdy seedlings during the early part of the year. Provided the cost is not prohibitive it would appear that the use of these lamps may possibly revolutionise the production of early produce, but I am inclined to think that the cost of installation and running may discount any advantage gained in the matter of earliness. Perhaps Mr. Falconer can supply us with some details respecting the initial cost of installing the apparatus, and also the current used per lamp per hour. In any case, it is a most interesting experiment, and the results obtained after further trial will be worth while recording. Experiments are being made at Kew and other centres with the use of Vita glass for glazing glasshouses. As most readers know, this glass permits the passage of the ultra-violet light rays, and the same advantages are claimed to be obtained by its use as Mr. Falconer hopes to get with sunlight rays, viz., the raising of earlier and stronger seedlings and plants. The initial cost of glazing a structure with this glass is somewhat high when compared with ordinary glass. At the present time, I believe Vita glass costs somewhere about two shillings per square foot, but I have no doubt that its cost will be reduced substantially when its manufacture is undertaken on a larger scale. It has been amply demonstrated that children and animals living in rooms glazed with Vita glass are benefited thereby, so that it only seems reasonable that plants will also be benefited by its use. *T. H. Everett.*

## SOCIETIES.

### ROYAL HORTICULTURAL.

APRIL 5 and 6.—All the available space in the Royal Horticultural Hall, Westminster, was well filled on these dates; indeed, many exhibitors had to be content with much less space than they applied for. Orchids were again shown extensively and made gorgeous and graceful displays, the superb group of Dendrobiums shown by BARON BRUNO SCHRÖDER thoroughly meriting all the praise bestowed upon it; the Orchid Committee recommended a Gold Medal for this group, and a Silver-Gilt Lindley Medal for the high cultivation it exemplified. Daffodils and Tulips were presented in large groups, while Azaleas, Cinerarias, Schizanthuses, Roses, Carnations, flowering trees and shrubs, alpine plants and early border flowers all contributed to the beauty and interest of the meeting. The Orchid Committee granted one First Class Certificate and eight Awards of Merit; the Narcissus and Tulip Committee, two Awards of Merit; and the Floral Committee eleven Awards of Merit.

#### Orchid Committee.

*Present:* Mr. C. J. Lucas (in the chair), Mr. Gurney Wilson, (Hon. Secretary), Mr. Stuart H. Low, Mr. Wilson Potter, Mr. E. R. Ashton, Mr. R. G. Thwaites, Mr. H. H. Smith, Mr. R. Paterson, Mr. J. Cowan, Mr. T. Armstrong, Mr. A. McBean, Mr. Charles H. Curtis, Mr. G. E. Shill, Mr. Fred K. Sander, Mr. J. Cypher, Mr. H. G. Alexander, Mr. A. Dye, Mr. Fred J. Hanbury and Mr. R. Brooman White.

#### LINDLEY MEDAL.

The Committee recommended a Silver-Gilt Lindley Medal for the magnificent *Odontoglossum Purple Emperor*. In the opinion of many experts this is the finest *Odontoglossum* yet raised. It was shown by the Exors. of the late Mr. H. T. Pitt.

#### FIRST CLASS CERTIFICATE.

*Cymbidium Pauwelsii*, *Ankersmit's* var.—A lovely flower of large size, good form and fine substance, and probably the finest variety of *C. Pauwelsii* yet seen. The colour is light greenish-yellow, with a suffusion of pink and faint veinings of rosy bronze. Lip, cream-coloured with rich, red-brown markings at the apex. Shown by Messrs. COWAN AND CO.

#### AWARDS OF MERIT.

*Odontioda Dove* var. *majestica* (*Oda. Joan* × *Odm. illustrissimum*).—A handsome, large-flowered variety, with rich red flowers, marked with rose-purple at the margins and also across the body colour. Lip deep red and rose, with golden disc. Shown by Messrs. J. and A. McBEAN.

*Odontoglossum plumptonense* var. *lilacina*.—The principal colour seen in the large flowers of this variety is deep lilac, but there are white bases to the sepals and petals, and a white apex to the gold, disked lip. Shown by Mr. J. EVANS, Colwyn Bay.

*Brasso-Cattleya speciosa magnifica*.—An exquisitely beautiful form, with flowers of large size. The colour is pale lilac-pink, deeper at the fringed apex of the lip, where it harmonises with the clear, light orange-yellow of the throat. Shown by Messrs. H. G. ALEXANDER, LTD.

*Cattleya Roseary* (*C. Schroderae alba* × *C. Lord Rothschild* var. *alba*).—A lovely hybrid with wide, white petals, cream-tinted sepals, and a lip that is soft orange-yellow, with white frilled margin and a touch of purple at the apex. Shown by R. GERRISH, Esq.

*Odontoglossum muralis*, *Gerrish's* var. (*Penelope* × *Clovis*).—A handsome variety with distinctly marked flowers. The sepals and petals are red-brown over the basal halves, and soft lilac on the upper halves; lip deep chocolate-red at the base and pure white at the apex. Shown by R. GERRISH, Esq.

*Odontioda Metis* (*Oda. Brewii* × *Odm. eximium*).—A bold, orange-red hybrid with a few faint markings of yellow; lip orange-red,

with central brown area, and golden disc. Shown by R. GERRISH, Esq.

*Brasso-Cattleya Springtide* var. *Ethel N. Satow* (*C. Mossiae* × *B.-C. Maronii*).—A superb Orchid with an immense flower of delightful purplish-mauve colour; the big, broad, fringed lip is of similar colour to the sepals and petals at the base and margins, but the central area is yellow, shaded with orange, the yellow veinings running back into a deeper purple shade around the column. Shown by FRED J. HANBURY, Esq., Brockhurst, East Grinstead.

*Cymbidium Pauwelsii*, *Brockhurst* var.—This was represented by a fine plant carrying two large spikes. The flowers are large, fawn-coloured, suffused with pink, the lip being buff-coloured with deep red-brown markings at the apex. Shown by FRED. J. HANBURY, Esq.

#### GROUPS.

BARON BRUNO SCHRÖDER (gr. Mr. G. E. Shill), Dell Park, Englefield Green, showed beautiful Dendrobiums, splendidly grown and finely arranged. The exhibit was a very large one, and consisted chiefly of *Dendrobium* Model and seedlings therefrom; the original *D. Model* was included, and we thought it as fine as any of its many beautiful progeny. There were scores of plants, all abundantly flowered, and each one was allowed to fully display its charms. Within this exhibit there were two contrasting groupings of the yellow *Dendrobium Thwaitesiae*, equally well-grown and profusely flowered, while at a higher level towards the back of the display were sheaves of spikes of *Calanthe Baron Schröder*, both dark and light forms.

R. GERRISH, Esq., The Manor, Millfield, Salisbury (gr. Mr. W. Sorrell), contributed a beautiful group of Orchids and staged the plants admirably. *Odontoglossums*, *Odontiodas* and *Cymbidiums* were very largely represented, and several plants gained awards. *Odontoglossum Proteus*, *O. crispum* Marjorie, and *O. eximium* were particularly good, while *Cymbidium Ceres*, *C. Pauwelsii*, *Brasso-Cattleya Rosita*, *Laelio-Cattleya Hassallii alba* and *Cattleya Wottersiana* (Queen Mary × Rajah) were also conspicuously good.

With all their plants set up in a delightful manner so that each could be seen as an individual, Messrs. H. G. ALEXANDER, LTD., exhibited a fine group wherein choice *Cymbidiums*, *Odontiodas* and *Dendrobiums* were prominent subjects. *Dendrobium Thwaitesiae* was good and there was a capital specimen of the fine old *Sophrontitis grandiflora* with eighteen blooms. The principal *Cymbidiums* were *C. Redshank*, *C. Goosander*, *C. Plover* var. *Puck*, *C. Redstart*—very fine, *C. Flamingo* and *C. Pauwelsii*. *Odontioda Charlesworthii*, *O. Bradshawiae*, *Holford's* var., and *O. Radiant* gave touches of brilliant colour, as also did *Brasso-Laelio-Cattleya Golden Horn*, with ten orange-tinted, yellow flowers. *Odontoglossum Anzac*, of rich yellow, *O. Faustina*, *O. crispum Zoroaster*, *O. Juno*, and *Cattleya Titius* var. *Gloriosa* were other showy plants in this fine display.

Messrs. COWAN AND CO. contributed a grand lot of *Cymbidiums* carrying large, handsome spikes. Of these *C. Ceres* was a splendid form, and so was *C. Pauwelsii aureum*, the splendid *C. P. Ankersmit's* var. and *C. P. Golden Prince*, and *C. Corona*. *Dendrobium atro-vioacea*, *Cypripedium Hesta*, *Miltonia Bleuana*, *Odontioda Juno*, *O. Grenadier* and *O. Murillo*, with *Odontoglossum Alastor* and *O. Colinge*, were other very attractive Orchids.
